4 DEPARTMENT OF ENERGY OVERSIGHT: STATUS OF CLEAN COAL PROGRAMS

5 TUESDAY, FEBRUARY 11, 2014

6 House of Representatives,

7 Subcommittee on Oversight and Investigations

8 Committee on Energy and Commerce

9 Washington, D.C.

10 The Subcommittee met, pursuant to call, at 10:04 a.m.,
11 in Room 2123 of the Rayburn House Office Building, Hon. Tim
12 Murphy [Chairman of the Subcommittee] presiding.

13 Members present: Representatives Murphy, Burgess,
14 Gingrey, Scalise, Harper, Olson, Gardner, Griffith, Johnson,
15 Long, Ellmers, Barton, Schakowsky, Butterfield, Castor,
16 Tonko, and Waxman (ex officio).

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee’s website as soon as it is available.

17 Staff present: Charlotte Baker, Press Secretary; Karen
18 Christian, Chief Counsel, Oversight; Carrie-Lee Early,
19 Detailee, Oversight; Brad Grantz, Policy Coordinator,
20 Oversight and Investigations; Brittany Havens, Legislative
21 Clerk; Mary Neumayr, Senior Energy Counsel; Sam Spector,
22 Counsel, Oversight; Peter Spencer, Professional Staff Member,
23 Oversight; Tom Wilbur, Digital Media Advisor; Phil Barnett,
24 Staff Director; Brian Cohen, Staff Director, Oversight and
25 Investigations, and Senior Policy Advisor; Kiren Gopal,
26 Counsel; Hannah Green, Staff Assistant; Bruce Ho, Counsel;
27 Elizabeth Letter, Press Secretary; and Alexandra Teitz,
28 Senior Counsel, Environment and Economy.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

|
29 Mr. {Murphy.} Good morning. Welcome to a hearing of
30 the Energy and Commerce Committee, Subcommittee on Oversight
31 and Investigations, this hearing on Department of Energy
32 Oversight, Status of Clean Coal Programs. Today's hearing
33 will review the status of these programs. This oversight, we
34 have focused on the department's efforts to advance carbon
35 capture and sequestration or CCS technologies at coal-based
36 power plants.

37 Legislation and regulation in this important area should
38 and must be based on sound scientific and economic facts.
39 Where are we? Where are we going? When can we get there?
40 And how do we do it?

41 Today's testimony, which builds on our oversight work
42 from this past October when we heard from workers and local
43 officials whose coal-dependent communities are suffering in
44 part because of EPA policies will help us review exactly
45 where DOE is today in its work on CCS.

46 There are many questions about the current status of
47 this technology. We are sure our panelists today will be
48 able to shed some light on this. Answering these questions

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

49 and gathering the underlying facts will help us understand
50 how carbon capture technologies can work effectively and
51 reliably on coal-powered plants. This testimony will also
52 help the committee develop a clear and accurate record of
53 what will be necessary, the innovation and operational
54 experience, economics, the timeframes to develop commercially
55 competitive CCS for coal-based power generation.

56 The technical and economic issues DOE confronts are not
57 everything that is needed to determine if CCS can work at a
58 large level in our nation's electricity system. There are
59 legal issues, regulatory issues, infrastructure issues. All
60 must be addressed appropriately.

61 Yet when looking at just the critical technical
62 challenges to CCS or coal plants, challenges for which
63 Congress has appropriated billions of dollars to DOE to
64 address, we have a way to go on several levels.

65 First, it has not yet been demonstrated that CCS systems
66 will work reliably at full-scale coal power plants. It is
67 not sufficient to rely upon paper estimates and laboratories
68 or speculation from EPA about technological feasibility.
69 Carbon dioxide capture and compression systems have to be

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

70 integrated into actual, full-scale coal power plants and be
71 shown to operate reliably over time while maintaining
72 predictable and safe plant operations. It does not appear
73 DOE will have complete answers about this for at least 6 to
74 10 years, so we need an update.

75 Second, the costs to produce electricity have come down
76 by a large amount to make any successful demonstrated CCS
77 systems commercially viable in open markets. The first
78 generation CCS technology, because of increased capital and
79 operating costs and decreased electricity produced, the
80 electric grid has been estimated to increase the cost of
81 electricity significantly.

82 At a coal gasification facility, the cost of electricity
83 may be increased by 40 percent, at a pulverized coal power
84 plant by upwards of 80 percent. This is what DOE's own
85 document tells us. Demonstrating full scale CCS is alone not
86 sufficient to make it the standard for the nation's coal-
87 based electricity generation.

88 If coal power plants cost too much, nobody will build
89 them. Energy costs will increase making it even more
90 difficult for families and U.S. manufacturers to compete.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

91 Which brings me to the third point, the research
92 development and innovative breakthroughs needed to produce
93 economically viable CCS technologies for coal power will take
94 operational experience and time, decades in fact. This is
95 not my opinion. DOE's own R&D timetables make this point to
96 us.

97 Over the past 10 fiscal years, more than \$7.6 billion
98 have been appropriated to DOE for its clean coal programs.
99 This spending reflects the confidence Congress has placed in
100 DOE and the National Energy Technology Laboratory, or NETL,
101 to help advance these technologies.

102 Given the spending and given the current economic and
103 regulatory landscape, oversight is necessary to ensure DOE's
104 stewardship of these funds and goals for its research are
105 effective.

106 It is also necessary to make sure energy and
107 environmental policies match the technological realities. We
108 are all committed to clean air, period. But moreover, we
109 must be committed to using North American energy resources
110 rather than continuing our trillion dollar trade deficit with
111 OPEC or \$4 trillion wars in the Mideast where we have to

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

112 defend their oil fields.

113 In this hearing, I hope we will get some straight
114 answers so that we can establish what is truly the status and
115 prospects of DOE's game plan for advancing coal power
116 technologies. Our two witnesses this morning should be up to
117 the task, highly qualified.

118 Dr. Friedmann presently heads DOE's coal programs and
119 has substantial experience working on energy projects at
120 Lawrence Livermore National Laboratory, and Scott Klara, an
121 authority on coal research from the National Energy
122 Technology Laboratory understands the R&D challenges.

123 We look forward to having you give us the plain facts,
124 not Washington spin. At the end of the day, straight answers
125 will help this committee determine whether DOE is up to the
126 task of shepherding the innovation that may dramatically
127 advance coal-based power both in terms of efficiency and
128 environmental goals.

129 But I worry that in the rush by the administration to
130 implement new standards and regulations on coal-based power
131 generation, the prospects for success or technological
132 advancements are at risk. All these are questions we hope

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

133 you can address today.

134 [The prepared statement of Mr. Murphy follows:]

135 ***** COMMITTEE INSERT *****

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

|
136 Mr. {Murphy.} And with that, I now will recognize Ms.
137 Schakowsky who is sitting in for Ms. DeGette for 5 minutes.

138 Ms. {Schakowsky.} Thank you, Mr. Chairman. I
139 appreciate our witnesses appearing today to tell us about the
140 progress of DOE's important carbon capture and storage
141 research development and demonstration work. I often say
142 that this Congress has an opportunity to lead this country
143 into the future with smart action that will curb emissions
144 and prevent irreversible climate change, but our window to
145 take action is rapidly closing.

146 We know that the National Oceanic and Atmospheric
147 Administration announced that 2013 was the fourth warmest
148 year on record, and 9 of the 10 warmest years have occurred
149 since 2000. For decades, the world's scientists have
150 presented policy makers with evidence that climate change is
151 happening and that human activities are responsible. Those
152 warnings have only grown stronger with time.

153 The president of the National Academy of Sciences has
154 explained that scientists are now as certain about human-
155 caused climate change as they are that smoking cigarettes can

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

156 cause cancer. We need to drastically reduce our carbon
157 emissions and quickly. We need to make a commitment to clean
158 and renewable sources that provide all of the jobs and energy
159 benefits of fossil fuels without the public health and
160 environmental costs.

161 We also need to use the best technology available to
162 reduce carbon emissions wherever we can. Carbon capture and
163 storage or CCS is one of those technologies. CCS investments
164 are proving that coal-fired power plants can capture a
165 significant percentage of their carbon pollution and safely
166 transport and inject it underground.

167 The Kemper facility in Mississippi set to go online
168 later this year will be the first commercial scale coal-fired
169 CCS project, but it is not the only one. There are projects
170 in California, Texas, and elsewhere including my home state
171 of Illinois that have attracted billions of dollars in
172 private financing. Those projects are demonstrating all the
173 individual elements of advanced CCS systems, carbon capture,
174 compression, transport, and sequestration technologies.

175 In September, EPA proposed a rule requiring new coal-
176 fired power plants to cut carbon pollution. To meet the

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

177 proposed standards, new coal plants will have to use CCS
178 technology to capture a portion of their carbon pollution.
179 Opponents have argued that the EPA should not have a role in
180 reducing carbon pollution from coal-fired plants and that CCS
181 technology isn't available now.

182 In fact, this committee passed a bill just last week
183 essentially eliminating EPA's authority to regulate carbon
184 pollution from coal plants.

185 Today's hearing should provide some much needed facts
186 about CCS and the economics of pollution controls. First
187 there is a critical role for government to play. Right now,
188 power plants can pollute without any adverse financial
189 impact. There is no financial incentive for industry to
190 develop and deploy pollution controls on a widespread basis.

191 If EPA doesn't require responsible action, we have no
192 chance of protecting public health and our planet over the
193 long term. It is also important to recognize that CCS
194 technologies are already available. All the component pieces
195 of CCS have been used in industrial applications for a long
196 time. Industrial facilities have separated carbon dioxide
197 for several decades. Oil companies have transported carbon

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

198 dioxide by pipeline and injected it underground for nearly 40
199 years.

200 Existing DOE programs have helped apply those
201 technologies in the power sector. Multiple demonstration
202 projects have applied these technologies to coal plants.
203 Several full-scale projects are under construction today, and
204 many vendors are willing to sell CCS technologies right now.

205 CCS is the only proven set of technologies that would
206 allow us to cut carbon pollution while still using coal. I
207 look forward to hearing from our DOE witnesses today about
208 their important contributions to our nation's vital effort to
209 cut carbon pollution. And I don't know if anyone would like
210 the remaining time. I yield back. Thank you, Mr. Chairman.

211 [The prepared statement of Ms. Schakowsky follows:]

212 ***** COMMITTEE INSERT *****

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

|
213 Mr. {Murphy.} Gentlelady yields back, and now recognize
214 Dr. Burgess for 5 minutes.

215 Dr. {Burgess.} Well, thank you, Mr. Chairman, and this
216 hearing is the perfect example of our constitutional
217 obligation, the constitutional obligation that is requires of
218 this subcommittee. On behalf of the taxpayers of this
219 country, we are required to do oversight. We are required to
220 ask the questions and get the answers. Our committee
221 authorizes the expenditure of money. The appropriators write
222 the check. The agency cashes the check, and it is our
223 obligation to ensure that that money has been spent
224 appropriately for the benefit of the taxpayer of this
225 country.

226 Every program, every agency, should come under similar
227 scrutiny. This is not partisan. It is not political. It is
228 basic oversight and applying common sense principles to allow
229 the government the opportunity to work more effectively and
230 efficiently on behalf of the taxpayer.

231 So for over a decade, the Department of Energy has been
232 focused on assisting industry to develop ways to reduce

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

233 carbon dioxide emissions, most notably although not
234 exclusively, through the carbon capture and storage
235 techniques. Research and development for these technologies
236 has cost the federal government billions of dollars.

237 So what did we get for the money we spent? Where does
238 this technology stand? Are we nearing commercial viability?
239 And if so, what is the timeline for your average generating
240 plant to be able to acquire such technology?

241 In Texas, many questions remain as to how carbon capture
242 and storage will affect neighborhoods and the environment
243 around generation plants. When pressurized carbon is
244 injected deep into the earth, how does that affect the ground
245 above? Are people's homes and businesses at risk from
246 seismic activity should this carbon accidentally be released?
247 Will the earth's surface around such sequestration attempts
248 be changed due to the injection of emissions? The federal
249 government must be honest and must be up front with the
250 American people as to the potential pitfalls as well as the
251 benefits to such technology.

252 So over \$7.5 billion has been appropriated over the last
253 decade for the development of clean coal's technologies. We

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

254 must have an accounting of every dollar and how the American
255 taxpayer is better off by each dollar having been spent.
256 Where has the money gone? What do we have to show for it? I
257 hope these questions can be answered during today's hearing.

258 With eight demonstration projects of carbon capture and
259 storage technology beginning around the country, two in my
260 home State of Texas, how many are close to actual operation?
261 How many are producing electricity that consumers can use
262 today? And if they are producing electricity that consumers
263 can use today, what effect has that had on the price for the
264 consumer?

265 A lot is riding on this. The federal agency is setting
266 regulations and standards based upon these demonstration
267 projects. We need to know where they stand. So today's
268 hearing is the kind of oversight this committee can do and
269 should do. It is the kind of oversight that we do best.
270 Asking questions as to how the authorizations passed by this
271 committee are being utilized by the department and how the
272 money the department received is being spent and ultimately
273 how that benefits the taxpayer.

274 I thank the chairman for the recognition. I will yield

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

275 back the time.

276 [The prepared statement of Dr. Burgess follows:]

277 ***** COMMITTEE INSERT *****

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

|
278 Mr. {Murphy.} Gentleman yields back. Now recognize Mr.
279 Waxman for 5 minutes.

280 Mr. {Waxman.} Thank you very much, Mr. Chairman. The
281 subject of today's hearing is one that is vital for the
282 future of coal and the climate, the development of carbon
283 capture and storage, or CCS technologies. Investments that
284 the Department of Energy is making in CCS will help industry
285 produce cleaner power, help provide a market for coal as the
286 world moves to cut carbon pollution, and help avoid a
287 catastrophic degree of climate change.

288 There is a long history of government investment driving
289 private sector technological advances. Government investment
290 led to the creation of the Internet, GPS positioning, and
291 even Apple's voice assistant Siri. Google Search algorithm
292 was financed by a grant from the National Science Foundation.

293 In the case of CCS, DOE is partnering with the coal
294 industry and utilities to build next generation clean coal
295 power plants, helping to create new jobs and control carbon
296 emission. Investing in CCS makes sense because our nation
297 and the world must reduce our carbon emissions.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

298 My Republican colleagues accuse the president of waging
299 a war on coal. In fact, the president is trying to create a
300 future for coal. His administration has invested millions of
301 dollars, more than any other administration, to develop clean
302 coal technologies. It is the policies pursued by Republicans
303 on this committee, not the president's policies, that are a
304 real threat to coal.

305 In fact, I am confident that the coal industry and
306 Republican members from coal states will soon regret the day
307 that they opposed the Waxman-Markey Climate Bill and the \$60
308 billion we proposed to invest in carbon capture and
309 sequestration.

310 Mr. Chairman, this committee is powerful. We have the
311 authority to shape our Nation's environmental and energy
312 laws. But there is one set of laws we cannot change. Those
313 are the laws of nature. The greenhouse effect tells us that
314 we will irrevocably change our atmosphere and cause
315 catastrophic climate change if we continue to burn coal
316 without developing a technology to capture its carbon
317 emissions. That is not a bright future for coal or any of
318 us.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

319 The DOE investments in CCS are under the spotlight now
320 because of EPA's proposed new power plant rule, but these
321 investments are crucially important and are starting to pay
322 off. Later this year, Southern Company's Kemper County
323 Energy Facility in Mississippi will begin operations and
324 capture 67 percent of its CO2 emissions. DOE's \$270 million
325 investment helped to make this plant a reality and attracted
326 billions of dollars in private financing.

327 Opponents of CCS say that technology used in Kemper
328 facility is too expensive. But the cost of virtually all new
329 technologies decrease over time with experience, continued
330 innovation, and economies of scale.

331 We have seen that repeatedly under the Clean Air Act
332 with scrubbers, NOx controls, and mercury controls. The
333 expert witnesses today will tell us that they expect to see
334 similar cost reductions with CCS technology.

335 In contrast, the cost of climate disruption are only
336 going to get worse, much worse, if we don't act now to cut
337 carbon pollution. Our choice is a simple one. We can do
338 nothing while coal plants continue to spew dangerous
339 emissions into the air, endangering the welfare of our

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee’s website as soon as it is available.

340 children and our planet. Or we can development the new clean
341 energy technologies of the future. The President and DOE
342 Secretary Moniz have made the right choice, invest in CCS.
343 Our choice should be to support them in this effort. Mr.
344 Chairman, yield back my time.

345 [The prepared statement of Mr. Waxman follows:]

346 ***** COMMITTEE INSERT *****

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

|

347 Mr. {Murphy.} Gentleman yields back. I would like to
348 now introduce our panel today. Dr. Julio Friedmann is the
349 Deputy Assistant Secretary for Clean Coal, Office of Fossil
350 Energy at the Department of Energy. In this capacity, he is
351 responsible for the DOE's research and development programs
352 and advance of fossil energy systems, large demonstration
353 projects, carbon capture utilization and storage, and clean
354 coal deployment. Before assuming his current position,
355 Friedmann was Chief Energy Technologist for Lawrence
356 Livermore National Laboratory.

357 Scott Klara is accompanying Dr. Friedmann today, and he
358 is currently the acting director of the Department of
359 Energy's National Energy Technology Laboratory where he is
360 responsible for managing the day-to-day execution of all
361 aspects of the lab's mission. He has 22 years of federal
362 government experience with NETL and its predecessor
363 organizations.

364 I will now swear in the witnesses. You are aware the
365 committee is holding an investigative hearing and when doing
366 so, has the practice of taking testimony under oath. Do you

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

367 have any objections to testifying under oath? Both witnesses
368 say no, and the Chair then advise you that under the rules of
369 the House and rules of the committee, you are entitled to be
370 advised by counsel. Do you desire to be advised by counsel
371 during testimony today? Both waive that.

372 In that case, if you will please rise and raise your
373 right hand, I will swear you in.

374 [Witnesses sworn.]

375 Mr. {Murphy.} Both witnesses answer in the affirmative,
376 so you are now under oath and subject to the penalties set
377 forth in Title 18, Section 1001 of the United States Code.
378 You may now each give a 5-minute opening statement. Dr.
379 Friedmann, we will begin with you.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

|
380 ^TESTIMONY OF JULIO FRIEDMANN, DEPUTY ASSISTANT SECRETARY FOR
381 CLEAN COAL DEPARTMENT OF ENERGY, ACCOMPANIED BY SCOTT KLARA,
382 ACTING DIRECTOR FOR THE NATIONAL ENERGY TECHNOLOGY
383 LABORATORY, DEPARTMENT OF ENERGY

384 } Mr. {Friedmann.} Thank you, Chairman Murphy, Ranking
385 Member Schakowsky, Ranking Member Waxman, and other members
386 of the subcommittee. Thank you for this opportunity to speak
387 to you today. It is really an honor and a privilege.

388 By way of introduction, I am the only Julio Friedmann
389 you will ever meet and was recently appointed to be the
390 Deputy Assistant Secretary for Clean Coal in the Office of
391 Fossil Energy. This is my second time testifying before this
392 committee, my first time in this role.

393 Prior to that appointment, I served as the Chief Energy
394 Technologist at Lawrence Livermore National Laboratory where
395 I coordinated and managed energy research programs across
396 laboratory. I have also worked in industry, five years at
397 Exxon Mobil in Houston and in academia as part of the faculty
398 of the University of Maryland.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

399 I am joined today by Mr. Scott Klara. He is the acting
400 director of our National Energy Technology Laboratory, the
401 only government-owned, government-operated laboratory with
402 the sole mission on fossil energy. Mr. Klara is responsible
403 for the execution and management of the program work here
404 where he served the Nation for over 20 years following a 7-
405 year stint in industry.

406 We appreciate this opportunity to discuss the Department
407 of Energy's coal research and development activities and
408 carbon capture and storage in particular. It is worth noting
409 that although I am the deputy assistant secretary for clean
410 coal, carbon capture and storage technology is not a coal
411 technology per se. It is an environmental technology whose
412 job is to reduce carbon dioxide emissions.

413 It has special relevance and importance to the coal-
414 powered systems in this country and in particular the
415 existing and future coal fleets. In that context, the
416 Department of Energy continues to play a leadership role in
417 the development of clean coal technologies with our focus on
418 carbon capture and storage.

419 As part of this in December, the department released an

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

420 \$8 billion draft loan guarantee solicitation to promote the
421 early deployment of innovative fossil energy technologies in
422 projects that reduce carbon emissions. This solicitation is
423 added to the already \$6 billion the Obama Administration is
424 committed to clean coal technologies. This reflects the
425 president's commitment, continued commitment, to an all-of-
426 the-above strategy. And it embraces an energy mix of nuclear
427 power, renewable energy sources, and fossil energy including
428 clean coal.

429 The clean coal research program is addressing the key
430 challenges that confront the development and deployment of
431 clean coal technologies. These include research and cost-
432 effective capture technologies, the development and
433 demonstration of advanced coal conversion and environmental
434 control technologies, and the safe and effective storage of
435 carbon dioxide in deep geological formations including
436 monitoring, verification, and accounting systems.

437 To get there, we are pursuing three technical pathways
438 for carbon capture: post-combustion, pre-combustion, and
439 oxygen-fired combustion or oxy-combustion. Research in these
440 pathways is exploring a wide range of approaches that,

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

441 coupled with advances in efficiency improvement and cost
442 reduction, including the developments in gasifications,
443 turbines, and advance combustion systems, will help provide a
444 technology base for commercial deployment of CCS broadly.

445 On the side of storage, we have pursued projects
446 designed to develop innovative advanced technologies and
447 protocols for the monitoring verification accounting of CO2
448 storage in geological formations as well as simulating the
449 behavior of geologically stored CO2.

450 The regional carbon sequestration partnerships are an
451 essential component of this effort and have successfully
452 executed 19 small to large-scale CO2 injection projects
453 nationwide including Texas, Alabama, Mississippi, Ohio,
454 Montana, Michigan, and Illinois. The program is currently in
455 the development phase during which large scale field testing
456 involves at least one million tons of carbon dioxide per
457 project implemented. Several of the large scale tests are
458 currently underway, and one project has safely interjected
459 over three and a half million tons of carbon dioxide which
460 continue to be monitored for safe and permanent storage.

461 Right now, the crown jewels of our program are the eight

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

462 major large CCS demonstrations deployed around the country.
463 They are selected in part on three important bases:
464 likelihood of technical success, likelihood of financial
465 success, and covering a wide set of national needs. We have
466 industrial and power projects, sale on formation, and
467 enhanced oil recovery projects, pre, post, and oxy-fired
468 projects, and both new-build plants and retrofits.

469 The plants within our portfolio produce power,
470 fertilizer, ethanol, and methanol. There are important
471 advances in several aspects of these projects. For example,
472 in east Texas, the air products and chemicals, industrial CCS
473 project is capturing CO2 from two steam-methane reformation
474 units, basically hydrogen plants.

475 The CO2 captured there is being used for enhanced oil
476 recovery, operations, and will pass one million tons of total
477 injection this fall. As mentioned by several members, the
478 construction of Kemper County's IGCC project by Southern
479 Company is near completion as is the completion of the Archer
480 Daniels Midland Industrial CCS Project in central Illinois.

481 And just last month, FutureGen 2.0 moved closer to
482 construction after the DOE approved the record of decision

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

483 needed to go forward with continued work and spending.

484 Since the inception of the carbon storage program, the
485 Department of Energy has recognized that a number of
486 utilization technologies could also play important mitigating
487 roles.

488 Aside from enhanced oil recovery though, the potential
489 for these approaches is limited for a number of technical
490 reasons including cost and market factors. In the meantime,
491 enhanced oil recovery represents the most commercially
492 attractive utilization option for CO2 storage and produces
493 substantial quantities of oil while storing carbon dioxide in
494 geological formations.

495 There are currently six of those large eight projects
496 which are employing CO2 enhanced oil recovery, two doing sale
497 and for storage projects across the U.S. As with the sale
498 and storage projects, the CO2 EOR projects are subject to
499 rigorous monitoring, verification and accounting procedures
500 to validate the storage of CO2 and verify their safety and
501 effectiveness.

502 To conclude, Mr. Chairman, CCS can play a critical role
503 in mitigating CO2 emissions under many potential future

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

504 carbon stabilization scenarios. Since challenges remain to
505 commercial deployment of these technologies, it is the
506 department's goal and the focus of our research efforts to
507 spearhead the research and development that would not have
508 occurred otherwise and has successfully leveraged private
509 investments in advancing the readiness of these emerging
510 clean coal technologies. Based on our, I believe, successful
511 track record, I believe that our clean coal research program
512 demonstrates that we can help meet the challenges associated
513 with CCS deployment.

514 With that, Mr. Chairman, I would be happy to answer any
515 questions you and the subcommittee have. Thank you for your
516 attention.

517 [The prepared statement of Mr. Friedmann follows:]

518 ***** INSERT A *****

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

|
519 Mr. {Murphy.} Thank you. Mr. Klara, we understand you
520 are here to answer questions but not to provide an individual
521 statement. So thank you. So I will recognize myself first
522 for 5 minutes.

523 Dr. Friedmann, thank you for that testimony. The DOE's
524 fossil energy office is responsible for overseeing all of
525 DOE's research and development and demonstration work for
526 clean coal technologies. Am I correct on that?

527 Mr. {Friedmann.} Yes, sir.

528 Mr. {Murphy.} Thank you. And you are the person in
529 charge of the clean coal work and report to the assistant
530 secretary, correct?

531 Mr. {Friedmann.} That is correct.

532 Mr. {Murphy.} Okay, the project and research
533 evaluations funding recommendations come from your people,
534 your team. Is that right too?

535 Mr. {Friedmann.} Yes, in partnership with NATL.

536 Mr. {Murphy.} And, Mr. Klara, quickly, I know and
537 respect the National Energy Technology Laboratory, but for
538 the record, NETL brings the science, the technical and

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

539 engineering expertise to DOE's programs, and your people do
540 the research and development and conduct day-to-day project
541 management. Is that correct?

542 Mr. {Klara.} Correct.

543 Mr. {Murphy.} Make sure your microphone is on. Now,
544 Dr. Friedmann, carbon capture and sequestration has never
545 been implemented commercially yet on a full scale at
546 functioning power plants. Is that correct?

547 Mr. {Friedmann.} That is a moving definition, sir.

548 Mr. {Murphy.} But so far. You are anticipating that it
549 is going to happen, but it hasn't happened yet. Am I
550 correct?

551 Mr. {Friedmann.} No, again it is a moving definition.

552 Mr. {Murphy.} What does that mean?

553 Mr. {Friedmann.} For example, we have deployed carbon
554 capture and storage at the Beulah Gasification Facility for
555 over 30 years and done carbon capture and storage from there
556 for enhanced oil recovery for over 10 years. That produces
557 high quality natural gas which goes into a pipeline that
558 powers power plants.

559 Mr. {Murphy.} All right, I am talking about commercial.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

560 Are those commercial plants, research plants?

561 Mr. {Friedmann.} No, that plant has been in commercial
562 operation for 30 years.

563 Mr. {Murphy.} Okay, I am talking about coal power
564 plant.

565 Mr. {Friedmann.} That is Burns North Dakota Lignite,
566 sir. Yes, it is a coal plant.

567 Mr. {Murphy.} Now, there presently are five coal
568 powered demonstration projects as part of the DOE funding.
569 Is that correct?

570 Mr. {Friedmann.} Yes, five power projects.

571 Mr. {Murphy.} One is FutureGen 2.0 which you refer to,
572 and four are authorized under the Energy Policy Act of 2005.
573 Is that correct?

574 Mr. {Friedmann.} I am sorry. Can you say that again,
575 please?

576 Mr. {Murphy.} One is the FutureGen which--

577 Mr. {Friedmann.} Yes.

578 Mr. {Murphy.} --you mentioned, and four others are
579 authorized under the Energy Policy Act of 2005.

580 Mr. {Friedmann.} Yes, sir.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

581 Mr. {Murphy.} Okay, now pursuant to the Energy Policy
582 Act, the technologies of these power plants supported by DOE
583 go well beyond the level of what is commercial service at
584 coal power plants or has previously been successfully
585 demonstrated on coal power plants. Is that correct?

586 Mr. {Friedmann.} I would say that is fair.

587 Mr. {Murphy.} Okay, and the point of the demonstrations
588 according to your agency is to demonstrate that CCS can be
589 integrated at commercial scale while maintaining reliable,
590 predictable, and safe plant operations. Is that correct?

591 Mr. {Friedmann.} Yes, sir.

592 Mr. {Murphy.} Thank you. But DOE says it won't really
593 know the result of these demonstration projects until they
594 are completed and evaluated. Is that correct?

595 Mr. {Friedmann.} The technical findings from these
596 projects have been brought forward as the projects proceed.
597 So again even though it is not a power project, I would point
598 to the air products project in Texas which came online
599 earlier this year, and the technical findings and results
600 from that are already available. And as more come forward,
601 more are available.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

602 Mr. {Murphy.} Now, I understand that reporting these
603 demonstrations, according to your own project schedule, to
604 take 6 to 9 years--

605 Mr. {Friedmann.} Yes.

606 Mr. {Murphy.} --for many of these? Okay, thank you.
607 Mr. Klara, we have spoken about this before. NETL says that
608 the CCS technologies in a current state of development are
609 cost prohibitive for full commercial service. What is a
610 realistic timeframe based on NETL's best estimates for a
611 commercially viable technology successfully completing
612 demonstration and coming to market?

613 Mr. {Klara.} With our program, we divide our technology
614 up into three development buckets. We call them first
615 generation technology, second generation, and
616 transformational. And with each one of those development
617 horizons, the cost and performance gets better. The first
618 generation technology are the technologies that you will find
619 in our current demonstration program. And these technologies
620 indeed can be commercially offered and commercially deployed.
621 With any development, and I think Congressman Waxman referred
622 to this relative to NOX and SOX control, that with any

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

623 development that with a learning curve as well as continued
624 development within the Office of Fossil Energies Program, you
625 can't expect those costs to go down and the performance to
626 increase.

627 Mr. {Murphy.} But your documents suggest it will take
628 until after about the mid 2020s for second generation
629 technologies and more than 20 years for what you call
630 transformational technologies. Am I correct in what your
631 documents say?

632 Mr. {Klara.} The additional buckets of technology,
633 second generation and transformation, will indeed take some
634 more time to achieve.

635 Mr. {Murphy.} So why do you believe that those
636 estimates are realistic? What will take the time?

637 Mr. {Klara.} I am not sure I understand when you say
638 when do we believe.

639 Mr. {Murphy.} Well that it is going to take to the mid
640 2020s or longer. Why do you believe those timeframes are
641 needed?

642 Mr. {Klara.} Well, with every bucket of our
643 technologies, we are constantly evaluating the R&D portfolio

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

644 every year looking at how developments are proceeding as well
645 as the scope of the portfolio. Some projects drop out.
646 Additional projects are brought in. And as part of that, we
647 are constantly doing analysis to evaluate when and to what
648 level we believe those technologies will achieve.

649 Mr. {Murphy.} Do you also assess commercial viability
650 in that process?

651 Mr. {Klara.} We assess the cost and performance. We
652 rely on industry and others to determine when it is viable.

653 Mr. {Murphy.} Okay, thank you. I see my time has
654 expired. Mr. Klara, when you talk, if you could move that
655 microphone closer to your face. Now recognize Ms. Schakowsky
656 for 5 minutes.

657 Ms. {Schakowsky.} I wanted to underscore what you said.
658 You said that there is CCS technology in play used right now
659 commercially and has been for several years. Is that true?

660 Mr. {Friedmann.} Yes, it is. There is commercially
661 available technology that can be sold by a wide number of
662 vendors, U.S.-based and international with the heavy of
663 equipment manufacturing made in this country. Pursuant to
664 the earlier conversation, most of those technologies have

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

665 been applied to industrial facilities. For example, the
666 Beulah site is a synthetic natural gas plant.

667 But in point of fact, the same technologies have been
668 demonstrated around the world in other coal-fired facilities.

669 Ms. {Schakowsky.} And would that technology fit into
670 bucket one? Is that what you are saying?

671 Mr. {Friedmann.} Yes, first generation.

672 Ms. {Schakowsky.} And to what extent does that reduce
673 then the carbon pollution? I mean you are saying that we
674 want to get to the third generation.

675 Mr. {Friedmann.} Right, so that actually varies by site
676 and by plant. Some of the plants, for example the Beulah one
677 I mentioned before, basically acts as about a 50 percent
678 decarbonization. Other plants we have seen, for example, the
679 air products plant is essentially 90 percent decarbonization.
680 We believe FutureGen will be effectively 100 percent
681 decarbonization when it is active. But it depends on the
682 technology. It depends on the plant. It depends on the type
683 of coal used and has to be calculated as such.

684 Ms. {Schakowsky.} I think what we are going to hear
685 today is that somehow this technology is not ready for

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

686 commercial use, that the production and the timeline is very
687 long and that what the president is doing to regulate carbon
688 pollution from new coal-fired power plants is not
689 appropriate. Could you comment on that veracity of that
690 argument?

691 Mr. {Friedmann.} We see our role chiefly as enabling
692 the reduction of cost and the improved performance of these
693 technologies as they enter the market and to work with
694 commercial industrial partners on the commercialization
695 themselves. Our job is not the commercialization or the
696 determination of economic viability. Our job is to support
697 the technology and the development of that.

698 Ms. {Schakowsky.} Okay, am I correct that there are
699 three basic steps in CCS, separately and compressing CO2,
700 transporting it by pipeline and injecting it underground?

701 Mr. {Friedmann.} Correct.

702 Ms. {Schakowsky.} And, Dr. Friedmann, do we know how to
703 separate and compress CO2 with current technology?

704 Mr. {Friedmann.} Yes, we do.

705 Ms. {Schakowsky.} And have we figured out how to
706 transport CO2 by pipeline?

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

707 Mr. {Friedmann.} Yes, ma'am.

708 Ms. {Schakowsky.} And do we understand how to inject
709 carbon into the ground? Is there enough viable storage
710 underground to ensure that we can inject CO2 without
711 constraints? And a safety question was raised as well.

712 Mr. {Friedmann.} Yes, ma'am.

713 Ms. {Schakowsky.} And so the basic building blocks are
714 all technologically viable?

715 Mr. {Friedmann.} The large-scale components of CCS have
716 been shown and demonstrated. And that is an important
717 technical finding.

718 Ms. {Schakowsky.} Okay, finally, Dr. Friedmann, are
719 there companies today that will sell technology to power
720 plant operators looking to implement CCS technology?

721 Mr. {Friedmann.} Yes, ma'am, with a performance
722 guarantee.

723 Ms. {Schakowsky.} With?

724 Mr. {Friedmann.} With a performance guarantee.

725 Ms. {Schakowsky.} So it sounds as if CCS is both real
726 and available. We also hear from the Republicans that CCS
727 simply costs too much, but the history of large-scale

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

728 technology development and the Clean Air Act in particular is
729 full of examples of pollution control costs decreasing over
730 time with continued innovation and economies of scale as
731 technologies mature and become widespread, costs naturally
732 come down. Would you anticipate that CCS costs will come
733 down as the technology matures and is put in place in more
734 locations?

735 Mr. {Friedmann.} Indeed.

736 Ms. {Schakowsky.} And why would that happen?

737 Mr. {Friedmann.} As with all clean energy technologies,
738 the value comes from deployment and cost reduction comes from
739 deployment. Engineers learn things, and they come up with
740 new ideas. We have seen this for many, many different kinds
741 of technology deployment, but it has been clearly
742 demonstrated for many energy technologies as well, from wind
743 turbines to solar panels to coal gasifiers to many other
744 kinds of technologies. And based on our thermodynamic
745 assessments and based on our engineering assessments, we see
746 multiple clear pathways to substantial cost production.

747 Ms. {Schakowsky.} Thank you. It seems to me what we
748 can't afford is the cost of carbon and other pollution from

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

749 coal. And as Mr. Waxman said, what we are hoping for today
750 is both to help the environment and coal. And I yield back.

751 Mr. {Murphy.} Gentlelady yields back. Can you just
752 clarify on her question? Were you referring to costs going
753 down on current plants or future plants?

754 Mr. {Friedmann.} Both.

755 Mr. {Murphy.} Okay, so current plants that have already
756 made their investment will see their cost decline because
757 they are saying they will make further investments. I just
758 want to make sure on her question.

759 Mr. {Friedmann.} Thank you for providing me the
760 opportunity to clarify that. That is an excellent question.
761 Any retrofit to an existing power plant will necessarily add
762 cost, but the cost of abatement itself today is a certain
763 price and will go down over time as more technology is
764 developed and deployed.

765 Mr. {Murphy.} Thank you. Now recognize the Chairman
766 Emeritus of the Committee, Mr. Barton, an engineer himself.

767 Mr. {Barton.} Well, thank you, Mr. Chair. I am not a
768 registered professional engineer anymore. I used to be, but
769 to the registered professional engineers, that is as it

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

770 should be a sensitive issue. So I have been registered, but
771 I am not at this time. But I was trained as an engineer and
772 did practice as a registered professional engineer.

773 I know that the purpose of this hearing is not on the
774 legality of these standards, but I do just want to point out
775 that in the Energy Policy Act in 2005, there is a section
776 402(i) that very specifically says that these clean coal
777 standards cannot be set on projects that are demonstration
778 projects that are receiving assistance. It is explicit. The
779 chairman and several others of us have sent a letter to the
780 EPA and DOE on that. I mean to EPA, but that is a subject
781 for a different issue.

782 My generic question is pretty straightforward. All of
783 these carbon capture sequestration technologies add cost to
784 these coal plants. Could you all give the subcommittee kind
785 of a baseline estimate of how much it adds to the cost? Does
786 it double the cost? Does it increase it by 25 percent, 50
787 percent? What is the generic estimate?

788 Mr. {Friedmann.} Thank you very much for your question.
789 I am happy to provide that answer. It is a question that a
790 great number of people are asking. First a quick caveat.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

791 Again that number, the precise number, will vary by plant
792 whether it is subcritical or supercritical by coal rank, and
793 by the kind of technology used.

794 Typically we express these costs as a range. So for the
795 first generation technology that Dr. Klara was mentioning
796 earlier, we are looking at something on the order of \$70 to
797 \$90 a ton. In that context, that looks something like a 70
798 or 80 percent increase on the wholesale price of electricity.

799 For the second generation technologies, which we are
800 developing, it is our strong expectation that that number
801 will be roughly half. We will be looking at something like a
802 \$40 or \$50 a ton cost.

803 Mr. {Barton.} So the initial technology almost doubles
804 the cost, and the next generation is going to add 25 percent
805 to the cost. Is that fair?

806 Mr. {Friedmann.} Again with respect to the wholesale
807 price, yes. The retail price, of course, will vary by
808 market. One of the points that I would like to make though,
809 it is in fact a substantial percentage increase in the cost
810 of electricity. But in part, that is because the current
811 price of coal is so low that it represents a large percentage

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

812 increase.

813 Mr. {Barton.} Now, what has to happen to go from
814 doubling to only increasing by 25 to 50 percent? What is the
815 timeframe for that? And how many plants have to be built and
816 how many more billions of dollars or hundreds of millions of
817 dollars have to be spent?

818 Mr. {Friedmann.} I am going to answer partly and leave
819 the rest of the answer to Mr. Klara for that. Again we have
820 laid out a very clear road map for R&D programs, and we
821 believe that we will hit the marks that we have laid out in
822 terms of major milestones and deliverables. We are looking
823 towards a second generation of demonstrations coming forward
824 in the next few years. They would be completely deployed and
825 the learnings provided back to the public about the middle of
826 the next decade, 2022 to 2025 timeframe. And those second
827 generation demonstrations would have substantially reduced
828 costs. Mr. Klara.

829 Mr. {Klara.} Yeah, and I will just confirm what Dr.
830 Friedmann said in terms of a 10 year or less timeframe to get
831 to that second generation developmental efforts. Relative to
832 costs to do that, our assumption for that is that we will

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

833 have levels commensurate with what we have today going
834 forward. And that is our basis in determining if and when we
835 can hit those marks. And again the 10-year time horizon or
836 less is the horizon we believe we are looking at right now
837 for these.

838 Mr. {Barton.} So 10 years is good. Now, all of these
839 demonstration projects, I believe, so far are on capture and
840 sequestration, but former Congressman Rick Boucher when he
841 was on the committee and the subcommittee chairman of the
842 Energy Subcommittee had a bill that he tried very hard to get
843 me to cosponsor. I never was able to unfortunately, but I
844 got him to put in that bill some language on conversion of
845 CO₂. I happen to think that it is going to be much more cost
846 effective to convert CO₂ as opposed to capture and sequester
847 it. Is EPA or DOE doing any research right now on CO₂
848 conversion as compared to capture and sequestration? And
849 this will be my last question.

850 Mr. {Friedmann.} Yes, sir. The good news is indeed we
851 are. In addition to carbon capture and storage, we also do
852 research and carbon utilization which includes using CO₂ to
853 make beneficial products or converting the CO₂ into other

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

854 substantives or products themselves. Currently the majority
855 of that effort is in enhanced oil recovery, which provides
856 many benefits to the country including domestic secure fuel
857 supply at low cost. There are other pathways to utilization
858 which we are pursuing. There is a project actually in Texas,
859 the Skyonics Project which we are piloting at about \$110
860 million. That is going to convert carbon dioxide to
861 basically mineral aggregate and cement add mixtures.

862 We are also looking at converting carbon dioxide into
863 algae and then that algae into other useful products
864 including animal feed on one end of the spectrum and possibly
865 biofuels on the other. We have a project at the Polk Plant
866 in Florida where we are doing that today.

867 Mr. {Barton.} You were ready for that question. Thank
868 you.

869 Mr. {Murphy.} The gentleman's time has expired. Now
870 recognize Mr. Waxman for 5 minutes.

871 Mr. {Waxman.} Thank you, Mr. Chairman. Well that is
872 what this hearing is all about, so I would expect you to be
873 ready for all of our questions since this is the field in
874 which you both work so carefully.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

875 Industry can pollute because it costs less to dump
876 pollution than to pay to clean it up. Unfortunately dumping
877 pollution is never really free. There are costs. The
878 American people bare those costs and bad health, and our
879 environment is also polluted. And we pay a price for that.
880 So the Clean Air Act is one of the most successful
881 environmental laws in the world, and one reason the Clean Air
882 Act works so well is that it sets standards to drive
883 technological innovation in pollution controls often called
884 technology forcing standards.

885 Currently there are no limits on carbon pollution from
886 coal-fired power plants. These plants are allowed to emit
887 unlimited carbon pollution into the atmosphere, and that is
888 just what they do. EPA is proposing carbon pollution
889 standards that would address this problem by requiring the
890 new power plants, coal-burning power plants, to reduce carbon
891 pollution by 30 to 50 percent by the use of partial carbon
892 capture and sequestration technology or CCS.

893 Dr. Friedmann, if we didn't have an EPA requirement,
894 would you expect the power sector to use CCS at new coal-
895 fired power plants?

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

896 Mr. {Friedmann.} It is unlikely that they would deploy
897 CCS technology in large part because they would not be able
898 to get return on their investments through the public
899 utilities commission process.

900 Mr. {Waxman.} And they don't want to make an investment
901 on something where their competitors aren't spending that
902 money either. Isn't that correct?

903 Mr. {Friedmann.} It is worth mentioning that I am not a
904 utility executive, but that has been my experience.

905 Mr. {Waxman.} Well, if you don't have this requirement,
906 why spend the money? Why would a coal company or a power
907 plant want to spend the money if they didn't have to if they
908 could do it without having to spend the money and they can
909 continue doing business as usual?

910 In 2011, the American Electric Power abandoned its plan
911 to install full-scale CCS at the Mountaineer Plant because
912 the company could not recover its costs in the absence of a
913 government requirement. So without a mandate, we are not
914 going to get carbon pollution controls on coal, and that is
915 why EPA rules are so essential.

916 Of course, government can also help industries develop

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

917 the technology to meet pollution standards. There is a long
918 history of government investment spurring private sector
919 innovation in areas such as defense, technology, energy
920 development. Even small government investments can produce
921 big gains for the public and create huge new markets. Dr.
922 Friedmann, isn't this what your office does? You invest in
923 new technologies and work with the private sector to help
924 clean up coal?

925 Mr. {Friedmann.} Indeed it is. We spend our
926 appropriations with the purpose of developing this
927 technology, demonstrating its validity, and helping
928 commercialize it in partnership with both utilities and heavy
929 equipment manufacturers and other industrial partners.

930 Mr. {Waxman.} Besides CCS, what are some examples of
931 pollution control technologies for coal or coal efficiencies
932 technologies that DOE has invested in and helped bring to
933 market?

934 Mr. {Friedmann.} One example is the TRIG Gasifier. The
935 transport gasifier was developed as a partnership between
936 Southern Company and the Department of Energy over the past
937 30 years. That is the core technology in the Kemper County

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

938 demonstration, and we have helped bring that from pilot
939 reactor scale up to large scale commercial demonstration.

940 Another example is a coal drying technology. This was
941 funded actually between 2000 and 2004 in North Dakota with
942 the Coal Creek Plant in which the lignite drying was used to
943 increase the efficiency of the power plant output and did so
944 between two and four basis points on the plant.

945 Mr. {Waxman.} So you had SCR and more efficient
946 boilers. Is that right?

947 Mr. {Friedmann.} SCR is another technology which
948 desulfurization and de-NOX technology, mercury technologies,
949 they are all technologies which the Department of Energy has
950 supported over the years.

951 Mr. {Waxman.} But we have a long record of DOE's
952 investments and EPA standards that work hand in hand. For
953 example, DOE funded the first U.S. demonstration of a
954 technology, this SCR, the selective catalytic reduction,
955 which was ultimately used to comply with EPA's NOX standards
956 in the 1990s. The same is now true with CCS. DOE has helped
957 develop the CCS technologies needed to reduce carbon
958 pollution from new coal-fired power plants, and now EPA has

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

959 proposed reasonable standards that will take advantage of
960 these demonstrated technologies to reduce carbon emissions.

961 Dr. Friedmann, what are the other advantages of these
962 government investments? Do you think there will be a global
963 market for American CCS technologies?

964 Mr. {Friedmann.} Indeed we are already seeing that. We
965 are seeing companies around the world, most notably in Japan
966 and in China which are interested in United States technology
967 that is considered clean coal technology both because of high
968 efficiency and because of potential for carbon capture.

969 Mr. {Waxman.} So it is good for American business? We
970 can export this?

971 Mr. {Murphy.} The gentleman's time has expired.

972 Mr. {Waxman.} Well, I want to at least go as long as my
973 colleague.

974 Mr. {Friedmann.} I think that would remain to be seen.

975 Mr. {Murphy.} He went over 55 seconds, so--

976 Mr. {Waxman.} So I think we ought to celebrate the
977 ability of the new technologies to go along with the
978 standards because it is going to be win-win proposition.
979 Thank you, Mr. Chairman, for your indulgence.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

980 Mr. {Murphy.} We will get the facts. You are welcome.

981 I will now recognize Dr. Burgess for 5 minutes.

982 Dr. {Burgess.} Thank you, Mr. Chairman. Again, thanks
983 to our witnesses for being here and being so thoughtful in
984 your preparation and your answers. Can we talk just a little
985 bit about the feasibility and what you have been able to
986 demonstrate commercially? I mean I get it that small
987 projects may hint at the feasibility of doing this type of
988 activity. But where do you think we stand as far as pushing
989 at the commercial viability? Because after all, that is what
990 I think the government investment was working toward, not
991 just an interesting experiment but something that will
992 actually work. So can you give us a sense of that
993 feasibility versus commercial viability?

994 Mr. {Friedmann.} Absolutely. Thank you for your
995 question and again this is a core question which is asked of
996 the CCS community regularly. I am happy to provide some
997 clarification. As I mentioned before, this first generation
998 CCS technology is commercially available today. You can call
999 up a number of U.S. and international manufacturers, and they
1000 will sell you a unit at a large scale for capture of more

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1001 than a million tons per year. In fact, a number of our large
1002 projects, for example, the Petro Nova Project in east Texas
1003 is run by NRG, in fact is using commercially available post-
1004 combustion capture technology unit. That procurement we
1005 expect to happen this year after they reach financial
1006 closure.

1007 Dr. {Burgess.} Now do you have any projection for the
1008 return on investment say for that NRG project in east Texas?

1009 Mr. {Friedmann.} Thank you. I am very happy to answer
1010 that question. Again this is an important one, and it will
1011 take just a moment to answer so please bear with me. We
1012 consider it an important function of the Department of Energy
1013 and as a government public goods return to help fund the
1014 first-of-a-kind project. First-of-a-kind projects are not
1015 projects which a bank will finance ever. So typically we
1016 provide anywhere from 10 to 30 percent of the cost share into
1017 a project to match the private capital do the rest.

1018 It is also our experience that the second-of-a-kind
1019 project is something the market takes on itself. In our
1020 communications with NRG so far, they have been very pleased
1021 with the return on investments they are going to get, granted

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1022 given that government money that helped get the project over
1023 the top. In large part, that is because of the return on
1024 investment from enhanced oil recovery revenues. And they
1025 purchased a component, an equity into the field which are
1026 producing additional oil from the CO2 injections.

1027 The last thing I wanted to say on this is that they have
1028 also told us that they believe that what they have learned on
1029 the first project is sufficiently good that they can do a
1030 second project and get sizable returns on investment without
1031 government assistance.

1032 Dr. {Burgess.} And have they prepared for you then any
1033 sort of pro forma or any type of accounting where the
1034 taxpayer investment may be expected to return a yield in the
1035 future?

1036 Mr. {Friedmann.} One of the things that is important
1037 about the deployment of these technologies is that it spurs
1038 new business models. One of the things that we have seen is
1039 they are creating a new business model by aggregating and
1040 holding company projects like this one and the other to get
1041 those returns.

1042 Dr. {Burgess.} Yeah, my time is going to run out, so I

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1043 am going to need to interrupt you. I am not trying to be
1044 rude here, but you did, I think, reference into another
1045 question that some of this activity has been going on for
1046 what did you say, 30 years or 35 years in the commercial
1047 production of carbon for oil recovery? Is that correct?

1048 Mr. {Friedmann.} Yes, sir.

1049 Dr. {Burgess.} So at what point? It has been 30 or 35
1050 years. At what point can we expect to see a return on
1051 investment if there is in fact a commercial application for
1052 recovered carbon dioxide?

1053 Mr. {Friedmann.} For most applications in the power
1054 sector, which is the area of greatest concern, I believe, to
1055 this committee, there is still a gap between how much you can
1056 sell CO2 for in post-combustion and how much you can--how
1057 much it costs to deploy. A typical CO2 off-take agreement
1058 for enhanced oil recovery is between \$30 and \$40 a ton.
1059 Typical post-combustion capture is between \$40 and--I am
1060 sorry--is between \$70 and \$90 a ton. And you can't make that
1061 up on volume.

1062 Dr. {Burgess.} No, you can't.

1063 Mr. {Friedmann.} So that is part of the basis on which

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1064 we continue to develop low cost technologies.

1065 Dr. {Burgess.} Again I am going to interrupt you
1066 because I need to go in another direction very quickly. I
1067 mean we are--in my home State of Texas, energy production is
1068 a big deal. There are some concerns surrounding a different
1069 type of energy technology and energy production with recent
1070 effects on seismic activity. Now, the head of the Texas
1071 Railroad Commission came and talked to us in 2005. He said
1072 the State of Texas was going to take title to the carbon that
1073 was being sequestered at one of the projects. How important
1074 is that that a state take that title to that compound? And
1075 then I guess the inference in that is the state would then
1076 have the liability that would not be borne by the industry.

1077 Mr. {Friedmann.} We continue to do work with the Bureau
1078 of Economic Geology, which is in close partnership with the
1079 Railroad Commission in Texas. We have a number of programs
1080 in our house which look at the potential risks associated
1081 with CO2 leakage, events like seismicity and how to manage
1082 those and monitor it well. The questions of long-term
1083 liability are ones which still remain open. There are many,
1084 many potential policy pathways to manage transfer of

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1085 liability and these sorts of issues.

1086 At this point, I believe that mechanisms like the one
1087 you described were put in place in part to attract industry
1088 to find ways to make it more advantageous and more possible
1089 in a state such as yours and Texas to execute CCS projects.

1090 Dr. {Burgess.} Thank you. Thank you, Mr. Chairman.

1091 Mr. {Murphy.} The gentleman's time has expired. Now
1092 recognize the gentlelady from Florida, Ms. Castor, for 5
1093 minutes.

1094 Ms. {Castor.} Well, good morning, and thank you, Mr.
1095 Chairman, for calling this Oversight hearing on the
1096 Department of Energy's clean coal initiatives. Last June,
1097 President Obama issued a climate action plan, correctly
1098 noting that we have a moral obligation to leave our children
1099 a planet that is not polluted or damaged.

1100 One way we can do that is through smart, clean
1101 technology investments like the kind that the Department of
1102 Energy is demonstrating with the next generation of power
1103 plants that employ carbon capture and storage. And I would
1104 like to find out from our witnesses how they believe their
1105 work fits in with the president's climate action plan and how

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1106 the clean coal research program is helping to combat climate
1107 change and reduce emissions of harmful greenhouse gases.

1108 Dr. Friedman and Mr. Klara, coal constitutes a
1109 significant percentage of this country's carbon emissions,
1110 approximately 30 percent. So logically cleaning up coal is
1111 essential to tackling climate change. Do you both agree with
1112 that statement?

1113 Mr. {Friedmann.} I am sorry. Could you make that
1114 statement again? I want to make sure I am answering
1115 correctly.

1116 Ms. {Castor.} Coal constitutes a significant percentage
1117 of the country's carbon emissions, approximately 30 percent.
1118 So logically cleaning up coal is essential to tackling
1119 climate change.

1120 Mr. {Friedmann.} There have been many economic analyses
1121 of a whole slate of clean energy technologies, and what has
1122 been the overwhelming conclusion of all of those studies is
1123 that if you take any clean energy technology option off the
1124 table, the cost of reducing CO2 emissions globally goes up.
1125 If you don't have an option like CCS, the total cost of
1126 managing climate change goes up. But that is true of all of

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1127 the clean energy technologies.

1128 Ms. {Castor.} Mr. Klara?

1129 Mr. {Klara.} And I think it is important to note also
1130 that our technology set is not just about coal. Our
1131 technology set is about CO₂. So if you look at the capture
1132 technology portfolio, most if not all of those technologies
1133 could work on natural gas, fire electricity, et cetera. If
1134 you look at the transport and storage component, a CO₂
1135 molecule is a CO₂ molecule.

1136 So the importance here is that the portfolio is truly a
1137 global portfolio that could impact future CO₂ emissions.

1138 Ms. {Castor.} Now, your testimony so far has
1139 illuminated that you have done substantial work on clean coal
1140 and carbon capture really probably more than most people
1141 appreciate that has been going on not just under the Obama
1142 Administration but under the Bush Administration before that.

1143 But now with the new climate action plan that is very
1144 broad-based and focused on a number of different strategies
1145 to reduce carbon pollution, Dr. Friedmann, how do the
1146 Department of Energy's carbon capture and storage investments
1147 fit in with the president's climate action plan?

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1148 Mr. {Friedmann.} It is actually literally central to
1149 the plan. It is in the middle of the document that carbon
1150 capture and storage is an important part of the strategy, and
1151 the basis for that is what I described before. Removing any
1152 option actually ends up increasing the net cost of the body
1153 public.

1154 Ms. {Castor.} And are there any other coal technologies
1155 that can reduce carbon pollution as much as carbon capture
1156 and storage?

1157 Mr. {Friedmann.} There are many coal technologies that
1158 could improve the efficiency of coal conversion that could
1159 reduce the emissions some. In order to dramatically reduce
1160 CO2 emissions, carbon capture and storage would be required.

1161 Ms. {Castor.} Okay, if the Department of Energy and
1162 researchers and your industry partners are able to
1163 successfully develop and advance CCS technology portfolio for
1164 large-scale deployment by 2020, what kind of impact do you
1165 think that could have on CO2 emissions and our climate?

1166 Mr. {Friedmann.} That ultimately really is a function
1167 of the rate of deployment, and the rate of deployment is
1168 contingent on many, many things. It is our hope to see

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1169 increase in large-scale deployment quickly so that say by
1170 2050, somewhere between 12 and 20 percent of U.S. emissions
1171 and 12 and 20 percent of global emissions would be managed
1172 through carbon capture and storage.

1173 Ms. {Castor.} Okay, well I am glad the Department of
1174 Energy is making these important investments because the
1175 dangers of climate change are real. The costs that face our
1176 communities all across this country are very significant, the
1177 costs to all Americans, the cost to businesses. We simply
1178 cannot put our head in the sand. Yet you see power plants
1179 today. They still have that business incentive to emit
1180 unlimited amounts of carbon into our atmosphere, and that
1181 means the rest of us will pay the price. So we have to work
1182 on this together. It is important that we make smart, clean
1183 technological investments now. Otherwise, we will not only
1184 make climate worse, but we will make it harder and more
1185 expensive to address the problem in the future. And we can't
1186 afford to ignore the crisis. This is America, and we can
1187 tackle this together. Thank you very much.

1188 Mr. {Murphy.} Thank you. The gentlelady's time has
1189 expired. Now recognize Dr. Gingrey for 5 minutes.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1190 Dr. {Gingrey.} Dr. Friedmann, you had been so accurate
1191 in answering all these questions. I am thinking about asking
1192 you if--your opinion on how much CO2 would be released into
1193 the operating room if you did a hysterectomy by robotic
1194 surgery versus the open convention method. I am just
1195 kidding, of course. I won't ask you that. You probably
1196 would have the answer to it.

1197 The first generation CCS project is currently on the way
1198 to full-scale demonstration do not all demonstrate the same
1199 technology, do they?

1200 Mr. {Friedmann.} No, sir.

1201 Dr. {Gingrey.} What is the value of demonstrating
1202 different types of technologies?

1203 Mr. {Friedmann.} Let me start answering this and then
1204 leave Mr. Klara some time as well. Today on a thermodynamic
1205 basis and a cost basis, all of the pathways look equally
1206 viable. Given that, it is hard to decide which technologies
1207 the market will select based on engineering and based on
1208 long-term cost reduction and viability. That is the basis on
1209 which we are pursuing pre, post and oxy-combustion pathways
1210 because on a thermodynamic limit basis and on an engineering

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1211 improvement basis, they all look like they could be winners.

1212 Dr. {Gingrey.} Before we go to Mr. Klara, the second
1213 part of that question. Are the current technologies being
1214 demonstrated sufficient to answer all the technical questions
1215 about full-scale operations of CCS for all types of coal
1216 plants using all types of coal?

1217 Mr. {Friedmann.} We would say the overwhelming majority
1218 of questions on the overwhelming majority of plants.

1219 Dr. {Gingrey.} Mr. Klara, did you want to comment on
1220 that?

1221 Mr. {Klara.} Yeah, I would like to comment that
1222 relative to our portfolio of technologies that one size
1223 doesn't fit all. Sorry about that. Better? Relative to our
1224 portfolio that one size doesn't fit all. So a portfolio of
1225 technology is sometimes needed to get the widest deployment.
1226 And also too it is important, I think, in a portfolio to have
1227 multiple technologies essentially competing with one another.

1228 And so what that does is it tends to really be a forcing
1229 factor to drive the cost down substantially relative to these
1230 competing options.

1231 Dr. {Gingrey.} Let me go back to Dr. Friedmann.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1232 According to DOE's December 2010 CCS R&D and demonstration
1233 roadmap, there were seven CCS demonstration projects for coal
1234 power plants. Three of these plants were estimated to start
1235 up in 2014, three 2015, and one in 2016. To date, only one
1236 project, Kemper County, Mississippi gasification project
1237 operated by the Southern Company, the great Southern Company
1238 headquartered in Atlanta, Georgia, is expected to start
1239 operations this year roughly on schedule. Two of the
1240 projects have been cancelled, and the remaining four projects
1241 are 2, 3, and 4 years behind schedule according to project
1242 summaries reviewed by our committee staff.

1243 First do you agree that some of these projects are
1244 significantly behind schedule? And secondly is it possible
1245 that we will see further delays or even abandonments before
1246 getting to the point of pushing the switch to start up
1247 operations given that four of the five projects are still
1248 only on paper? Construction has not commenced, and finance
1249 hasn't all be closed.

1250 Mr. {Friedmann.} Thank you. That is an excellent
1251 question, and I am happy to answer it. It is the nature of
1252 large projects that they take longer than expected, cost more

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1253 than expected, and some of them don't make it. In this
1254 context, it is part of the reason why we are so committed to
1255 the portfolio of projects that we have.

1256 Sometimes things just get in the way, and you can't
1257 anticipate them. In that exact context, we are passionately
1258 committed to seeing all of those projects succeed, all eight
1259 of them. And right now, we are on a trajectory where all
1260 eight of those projects are headed for commercialization.
1261 And I want to just reiterate, I am not--I do not believe and
1262 I would not say that I am concerned about the delays. It is
1263 the nature of large projects, in particular getting the debt
1264 financing and the equity.

1265 Dr. {Gingrey.} Let me ask Mr. Klara to comment on that
1266 too as well, Dr. Friedmann.

1267 Mr. {Klara.} On the same topic?

1268 Dr. {Gingrey.} Yes, on the same topic, yes.

1269 Mr. {Klara.} Yeah, it is a difficult environment right
1270 now relative to putting new plants in play, and that
1271 difficult environment has a couple factors to it. One is
1272 that it requires billions of dollars worth of financing to
1273 put a plant into play and financing is--

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1274 Dr. {Gingrey.} Okay, I am going to stop you because I
1275 have one last question that I want to get in and I don't run
1276 over time. Now, if that is the case, how has the Department
1277 of Energy been adjusting its timeframes and game plan to
1278 ensure that CCS technologies for coal-fired power plants are
1279 sufficiently demonstrated across the types of coal and
1280 various types of coal plants? Will you have all the answers
1281 by 2025, 2030? And what happens if two or three of these
1282 coal projects are significantly stalled or indeed cancelled?

1283 Mr. {Friedmann.} Again we are still on track for what
1284 we think is the second generation of demonstrations by 2025,
1285 and that that is the timeframe in which the most important
1286 learnings will be needed. Even if one or two of the projects
1287 should unfortunately happen to fall apart, that would leave a
1288 gap in our understanding but would still provide a lot of
1289 information and a lot of technical findings around what is
1290 necessary to get projects off the ground and the likely
1291 performance of the technologies.

1292 Dr. {Gingrey.} My time has expired.

1293 Mr. {Murphy.} Thank you. The gentleman's time has
1294 expired. Now recognize Mr. Tonko for 5 minutes.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1295 Mr. {Tonko.} Thank you, Mr. Chair. House Republicans
1296 have talked incessantly about the administration's supposed
1297 war on coal. This simply doesn't square with reality. The
1298 fact is the Obama administration has invested billions of
1299 dollars in projects with industry partners to advance
1300 technologies for coal-fired power generation.

1301 DOE's CCS investments along with the EPA's proposed
1302 carbon emission rules for electric plants will assure that
1303 coal has a way to remain viable even as we have to cut carbon
1304 pollution and avoid catastrophic climate change. That being
1305 said, Dr. Friedmann, how do you react to the allegations that
1306 the administration is waging this war on coal? You work with
1307 the coal industry on a regular basis. What is your
1308 relationship with the industry like?

1309 Mr. {Friedmann.} It is both my pleasure and my
1310 privilege to work with the coal industry, which contains some
1311 of the best minds and the best businesses in the United
1312 States. And I continue to believe that coal is actually a
1313 required part of a vibrant American economy and part of the
1314 future. In this context, the work we are doing on CCS is
1315 critical. It is a key pathway forward for a sustainable low-

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1316 carbon energy future with an era of abundance of fossil
1317 energy that we live in today.

1318 Mr. {Tonko.} Thank you. And, Dr. Friedmann, how
1319 important do you think DOE's CCS investments are for the
1320 future of the coal industry?

1321 Mr. {Friedmann.} Again it is very hard to achieve
1322 climate change goals and deep emissions reductions in the
1323 fossil energy sector without CCS. Secretary Abraham in 2002
1324 called it basically a sine qua non technology. It is a
1325 technology which we simply need to have.

1326 Mr. {Tonko.} And DOE invested some \$270 million, I
1327 believe, in the Kemper facility.

1328 Mr. {Friedmann.} \$270 million, sir.

1329 Mr. {Tonko.} Right.

1330 Mr. {Friedmann.} Yeah.

1331 Mr. {Tonko.} In the Kemper facility that is set to come
1332 online later this year. How much private capital was added
1333 to that DOE initial investment?

1334 Mr. {Friedmann.} I believe at this point, it is up
1335 about \$4.5 billion total.

1336 Mr. {Tonko.} Four point five billion?

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1337 Mr. {Friedmann.} Yes, sir.

1338 Mr. {Tonko.} Well, that is an immense investment to new
1339 coal spurred by DOE funds. And according to Southern Company
1340 subsidiary, Mississippi Power, the project is creating nearly
1341 12,000 direct and indirect construction jobs and will create
1342 over 1,000 direct and indirect permanent jobs.

1343 Dr. Friedmann, DOE has also invested \$450 million in
1344 this Summit Texas Clean Energy Project. How much private
1345 financing was added to DOE's investment in that given
1346 project?

1347 Mr. {Friedmann.} Okay, we have committed to Kemper--I
1348 am sorry--to Summit, it is a commitment. It has not yet been
1349 spent. But it is close to financial closing. It has not yet
1350 closed financially. It is our expectation that we will
1351 ultimately lever about \$3 billion of foreign direct
1352 investment into that project.

1353 Mr. {Tonko.} And again according to the company, my
1354 information is that the project is expected to create up to
1355 2,000 direct construction jobs and 150 direct permanent jobs.
1356 So what do you think these projects tell us about the future
1357 of CCS? Are private financiers going to invest big in

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1358 projects like this if they don't see them as viable or
1359 profitable?

1360 Mr. {Friedmann.} Again a critical finding for the
1361 Department of Energy's work in all energy sectors is that we
1362 cannot attract investment in the first plant absent
1363 government support. Once the first plant is built and
1364 demonstrated and improvements are made in engineering,
1365 business model and financing, then the second project and the
1366 third project can get done by the private sector. Absent
1367 that initial federal investment, the project won't get built.

1368 Mr. {Tonko.} We are focusing on CCS today, but there
1369 are other ways to reduce carbon emissions through increasing
1370 the efficiency of coal-fired generation. And Representative
1371 Waxman, I believe, asked you a bit about that efficiency.
1372 What level of efficiency improvements are being targeted by
1373 your research program?

1374 Mr. {Friedmann.} We are basically looking to make for
1375 the most part incremental improvements in the efficiency.
1376 For people who aren't engineers, a one or two percent plant
1377 efficiency sounds small, but it is not. It is actually a big
1378 improvement on the output of the plant. Just a couple of

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1379 basis points actually is big. For individual components of
1380 the program, for example sensors and control systems,
1381 advanced manufacturing, these sorts of things, for the most
1382 part can improve the existing fleet each a couple of percent.

1383 Mr. {Tonko.} I know that I have used up my five
1384 minutes. So with that, I will yield back, Mr. Chair.

1385 Mr. {Murphy.} Thank you. Just to clarify what you
1386 said, you said \$270 million, is that what your--

1387 Mr. {Friedmann.} For the Southern Company Project, yes.

1388 Mr. {Murphy.} Energy. And I think there was also some
1389 investment tax credits, \$130 or so.

1390 Mr. {Friedmann.} So the \$130 million of investment tax
1391 credits are set to lapse in May because of the delays
1392 associated with the project.

1393 Mr. {Murphy.} So they will not get that investment tax
1394 credit?

1395 Mr. {Friedmann.} We are still in discussions with the
1396 IRS, but at this point, no, they would not be eligible to
1397 receive those investment tax credits.

1398 Mr. {Murphy.} And just can you follow up. So the
1399 initial costs, I think, were \$1 billion now. It is \$4.5 to

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1400 \$5 billion talking about the plant costing?

1401 Mr. {Friedmann.} I think the original plant costs were
1402 more like \$2 billion, but, yes, there has been substantial
1403 increases in the cost of the plant.

1404 Mr. {Murphy.} Thank you. Thank you for clarifying
1405 that. Now I recognize Mr. Scalise for 5 minutes.

1406 Mr. {Scalise.} Thank you, Mr. Chairman. I appreciate
1407 you holding this hearing, and I want to thank our two guests
1408 for coming from the department. The 2010 report on
1409 interagency task force on carbon capture and storage. I
1410 believe that was both Department of Energy and EPA that put
1411 that report together. But it notes that existent CO2 capture
1412 technologies for coal-based power plants ``are not ready for
1413 widespread implementation primarily because they have not
1414 been demonstrated at the scale necessary to establish
1415 confidence for power plant application.'' And the DOE goal
1416 of developing systems that result in a less than 10 percent
1417 increase in the cost of energy by 2015 is still at a
1418 conceptual stage.

1419 So we had Kemper here before our committee talking about
1420 some of the challenges that they are facing in kind of being

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1421 that first company to come out and do this. I think you all
1422 recognize that, you know, we still don't have a replicable
1423 model. It seems like there is a difference between
1424 Department of Energy and EPA on whether or not you have got
1425 one plant being built, how their experience is working,
1426 especially with the uniqueness of their location to energy
1427 sites where, if you can use that carbon capture to do
1428 enhanced oil recovery, which is definitely something that is
1429 important to our state in Louisiana, Texas, other states.

1430 But if you don't have that same proximity, then the
1431 viability isn't the same either, and do you all recognize
1432 that especially when you are looking at whether this facility
1433 is a replicable facility?

1434 Mr. {Friedmann.} So because it has been brought up
1435 twice, let me mention that Mr. Klara was an important
1436 contributor to the 2010 report. I would be remiss if he
1437 didn't have a chance to at least speak to it. But to the
1438 pursuant of your question, the technical availability is
1439 independent of the economic viability. And we in fact have--
1440 you can deploy the same technology in Illinois where there is
1441 not enhanced oil recovery opportunities as you would deploy

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1442 in Texas.

1443 The return on investment would vary, and part of the
1444 goal is to find ways and pathways that we can pursue to
1445 reduce the cost so much that the local increase in cost of
1446 electricity is as low as possible.

1447 Mr. {Scalise.} And I will let Mr. Klara give his answer
1448 first, and then I want to get into that, that increased cost
1449 of electricity because at the end of the day, consumers are
1450 concerned as people are out advancing new technologies, we
1451 all promote the advancement of new technologies. But you
1452 have also got to be concerned about the impact on consumers
1453 when they talk about, you know, whether or not it is going to
1454 increase their household electricity rates. That is their
1455 main concern, and clearly we are seeing increases in a number
1456 of these areas on the amount people pay for their household
1457 electricity. That affects lower income people most, and yet
1458 that is one piece of the equation that I am not sure if EPA
1459 is really that concerned about right now. But, Mr. Klara, if
1460 you want to go.

1461 Mr. {Klara.} The purpose of our demonstrations is
1462 indeed to get us over that hurdle of proving the technologies

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1463 in a commercial scale, and you mentioned the cost issue.

1464 These projects are first of a kind, and, as Dr. Friedmann

1465 indicated, that is why the government investment is so

1466 important to get them up over that hurdle.

1467 And what we can speak of relative to cost, again going

1468 back to some earlier comments, would be the fact that our

1469 portfolio is designed to drive that cost down substantially

1470 in addition to these learning curves which these

1471 demonstrations are critical to get started.

1472 Mr. {Scalise.} Let me ask you. We know that at present

1473 none of the CCS technologies for coal-fired plant power

1474 generation has successfully completed demonstration. Is that

1475 correct?

1476 Mr. {Friedmann.} In this country, that is correct.

1477 Mr. {Scalise.} Okay, we know that this will take

1478 upwards of 10 years to establish. Is that correct?

1479 Mr. {Friedmann.} I don't think that is correct

1480 actually.

1481 Mr. {Scalise.} How long do you think it would be?

1482 Mr. {Friedmann.} Again we are already gathering

1483 learnings from our demonstrations as they are standing up.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1484 Kemper will be operational at the end of this year. That
1485 will be an important technical finding, and within sort of
1486 two or three years of operation, we should have a strong
1487 sense as to whether or not that plant is replicable in a
1488 viable option for the future.

1489 Mr. {Scalise.} Well, and I hope you would know that
1490 Southern Company, the owner of the Kemper plant, has said
1491 that this plant ``cannot be consistently replicated on a
1492 national level.'' Were you aware that they said that?

1493 Mr. {Friedmann.} Yes, sir. We have had those
1494 conversations with the CEO and the senior staff of Kemper and
1495 of Southern Company. That is exactly the basis on which we
1496 have a wide portfolio of plans.

1497 Mr. {Scalise.} Because they are the ones that are out
1498 there making this big investment. They are seeing that the
1499 costs are a lot more than anybody expected, and they are also
1500 recognizing the geographical limitations that you can't just-
1501 -you know, and if EPA wants to go and say okay, look, they
1502 were able to do it and they figured out a way to make it
1503 work, cost them a whole lot more than they were expecting,
1504 but they made it work, discounting the fact that the way they

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1505 had to make it work was having this close proximity for EOR.
1506 Then they are going to go and say okay, well now everybody
1507 can do it and come up with some rules that literally shut
1508 down power plants or raise the cost so high that again you
1509 get to this problem that consumers then would have 10
1510 percent, 20 percent, maybe higher increases in the
1511 electricity rates.

1512 And I just hope that that would be a big part of the
1513 consideration too is the impact on consumers, especially poor
1514 people, when they are going to have to pay the bill.

1515 Mr. {Friedmann.} Thank you again for that question. We
1516 really do understand the issues that consumers and the power
1517 generators share about concern about cost.

1518 Mr. {Scalise.} I just hope EPA has that same concern,
1519 and I yield back the balance of my time.

1520 Mr. {Murphy.} Gentleman yields back, and now to the
1521 gentleman from Mississippi who represents the third district,
1522 the home of Kemper plant, which we hope he invites this
1523 committee to. Mr. Harper is recognized for 5 minutes.

1524 Mr. {Harper.} Thank you very much, Mr. Chairman. I
1525 appreciate the opportunity, and certainly we are enjoying

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1526 watching that massive facility being built in Kemper County,
1527 and as you know that is in my district in Mississippi. But
1528 it is clear others around the world are watching to see how
1529 this goes forward. If, as EPA says, this has all been done
1530 before, what is it about Kemper that makes it so important to
1531 the future of clean coal technology in this country and
1532 around the world?

1533 Mr. {Friedmann.} Let me start by stating that there is
1534 just an immense body of evidence around the function, cost,
1535 likely future cost, and technology pathways, current
1536 performance and so forth for carbon capture and storage.
1537 That said, we have a special place in our hearts for the
1538 Kemper plant. In part because it is truly demonstrating a
1539 novel gasification technology, the TRIG gasifier at
1540 commercial scale, in part because it is testing a new
1541 business model, this co-location of mining, upgrading, and
1542 refining.

1543 Kemper is not just a power plant. It is basically a
1544 carbon refinery which sets out a number of products including
1545 ammonia, liquid fuels, as well as CO2 for enhanced oil
1546 recovery. That business model is every bit as important as

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1547 the technical findings that we are going to get from this.

1548 Mr. {Harper.} Mr. Klara, anything you would like to add
1549 to those remarks?

1550 Mr. {Klara.} Well, I concur with that, but also just a
1551 couple comments on our demonstration program in general. My
1552 belief would be that none of these project developers, none
1553 of these companies came into this with their view of this is
1554 going to be a one-off, one-of-a-kind. And so a lot of
1555 business models certainly going into our demonstration
1556 program are indeed looking at replication of this technology
1557 at some point.

1558 Mr. {Harper.} And that replication you would view as
1559 just in the United States or worldwide?

1560 Mr. {Klara.} Well, if you look back to the history of
1561 things like criteria pollutants, NOX and SOX control that the
1562 United States showed technology leadership. And much of that
1563 technology is being deployed internationally. I would expect
1564 the same to occur with the development of carbon capture and
1565 storage.

1566 Mr. {Harper.} And then Mr. Friedmann.

1567 Mr. {Friedmann.} If I could add a little bit to that.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1568 Mr. {Harper.} Yes, please.

1569 Mr. {Friedmann.} Our conversations with Southern make
1570 clear that they very much see a Kemper 2.0 and a Kemper 3.0
1571 and imagine some of those plants around the world where low-
1572 cost lignite is also available.

1573 Mr. {Harper.} Okay, and as you said the Kemper projects
1574 works in this particular situation in Mississippi because of
1575 the TRIG technology, which gasifies local lignite coal and
1576 uses the carbon to increase nearby oil production. Where
1577 else in the world is there this sort of potential where you
1578 have a generation source no one would otherwise use and the
1579 CO2 can be used for oil production?

1580 Mr. {Friedmann.} In the United States, we are looking
1581 all along the Gulf Coast, also in North Dakota in the lignite
1582 belt. Outside the United States, we are looking at Turkey.
1583 We are looking at inner Mongolia. We are looking at
1584 Kazakhstan. There are other places where there are a
1585 combination of resources in the form of lignite and enhanced
1586 oil recovery opportunities. Pakistan is another one where
1587 one could imagine building a plant like this and reaping the
1588 commercial benefits.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1589 Mr. {Harper.} You know, a few years ago, people were
1590 saying that there is nowhere near the capacity in enhanced
1591 oil recovery to take the output of the CO2 from a large point
1592 of the coal fleet. Now I am hearing some say that the
1593 capacity for EOR is growing substantially. But what is the
1594 potential for enhanced oil recovery in this country? And is
1595 there potential for this technology to grow particularly in
1596 light of recent advances in oil exploration and production?

1597 Mr. {Friedmann.} Thank you. That is an excellent
1598 question. It also gives me the opportunity to acknowledge
1599 the outstanding work of Advanced Resources International here
1600 in Virginia, which has done a lot of this analysis. Indeed
1601 detailed characterization and assessments of fields in the
1602 United States and worldwide shows a much higher opportunity
1603 for enhanced oil recovery than previously recognized in the
1604 United States, well north of 60 billion barrels of potential
1605 additional recovery. Beyond that, we are seeing advanced
1606 technology and practice in enhanced oil recovery, in
1607 particular, looking at residual oil zone production as a
1608 further multiplier, possibly two to three times that much in
1609 the United States, creating the opportunity for hundreds of

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1610 billions of barrels around the world. In all those
1611 locations, the primary limiting step is the availability of
1612 carbon dioxide for EOR.

1613 Mr. {Harper.} Thank you both for being here, and, Mr.
1614 Chairman, I yield back the balance of my time.

1615 Mr. {Murphy.} Gentleman yields back. Now go to Mr.
1616 Olson of Texas for 5 minutes.

1617 Mr. {Olson.} I thank the chair, and welcome to Dr.
1618 Friedmann and Mr. Klara. Back home in Texas, we have a
1619 saying you probably have heard. Always put the horse before
1620 the cart. The research you all are doing with CCS is the
1621 horse that makes CCS viable in the free market. You are
1622 pulling the cart. Unfortunately EPA is using the research as
1623 a model for the entire country that CCS is viable. That is
1624 putting the cart before the horse. It is not viable.

1625 And, Dr. Friedmann, you testified with Ms. Schakowsky
1626 that your job is not to determine viable, just the science of
1627 it. I am glad to hear that she brought--but there are
1628 pockets of viability here in America for CCS. They are in
1629 Texas in my district outside of Houston. They are viable
1630 because using captured CO2 for enhanced oil recovery

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1631 operations, EOR. EPA knows this.

1632 In the new plant's rules impact analysis, here is a
1633 quote from EPA's report. ``The opportunity to sell the
1634 captured CO2 for EOR, rather than paying directly for its
1635 long-term storage, strongly improves the overall economics.''

1636 I was pleased to hear you mention Petro Nova. That is
1637 the Parish power plant in Needville, Texas. I can see that
1638 power plant walking out on my front lawn. It is one of the
1639 largest ones in the country, as you know. Four natural gas
1640 generators of power, four coal generators of power with the
1641 natural gas, the fifth one, coming online quickly.

1642 The plant sits on top of an old oil field, very close to
1643 it. They are capturing CO2 right now to use it to get oil,
1644 but their situation is unique, and that is why it may be
1645 viable. There is another project in my district called
1646 Denbury Resources there in Alvin, Texas. In 2001, they
1647 bought the Jackson Dome in Mississippi. As my colleague to
1648 my left, Mr. Harper knows, that is the largest natural CO2
1649 deposit east of the Mississippi River. It is 98 percent pure
1650 CO2.

1651 With a massive pipeline infrastructure between the Gulf

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1652 Coast, going up to New England, the eastern part of the
1653 United States, they have access to pipelines. They are
1654 shipping that CO2 from Mississippi down to Texas, the old
1655 Hastings Oil Field, and using that CO2 to get enhanced oil
1656 recovery operations.

1657 My question is is it fair to say there are few
1658 situations like Parish in Denbury. Now, most states have
1659 little opportunity, no chance for enhanced oil recovery
1660 operations inside their borders.

1661 Mr. {Friedmann.} Thank you. I am happy to answer that
1662 question having spent happily 5 years living in Texas myself,
1663 I am sure you are familiar with the saying you don't want to
1664 be all hat, no cattle.

1665 Mr. {Olson.} Yes, sir.

1666 Mr. {Friedmann.} And we view our job in that context.
1667 CCS, in particular enhanced oil recovery, we view as the
1668 bridge to the bridge of the future. That if we are building
1669 a bridge through CCS deployment to a clean energy future,
1670 then EOR is an important bridge to that bridge. There are a
1671 couple of important benefits that come from EOR early
1672 deployment.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1673 The first of these is that you actually get to build the
1674 plant. That is the critical increment that leads to reduced
1675 costs widely. In order for us to see a viable future for CCS
1676 widely deployed, we believe that the cost must come down
1677 broadly. That means building plants and demonstrating how
1678 and learning how to reduce those costs. The EOR projects
1679 give us those first-of-a-kind opportunities to figure out how
1680 to do that.

1681 The second thing I would add is that there may be more
1682 of those opportunities than initially recognized. Per my
1683 last comments to Mr. Harper, it is looking like these
1684 residual oil zones are more broadly distributed than
1685 originally understood, and that provides more opportunity
1686 nationwide.

1687 We are also seeing projects like the Boundary Dam
1688 Project in Canada, which is a post-combustion capture project
1689 like PetroNova's project where they are taking CO2 by
1690 pipeline to the Midale Field in Saskatchewan. And they have
1691 also learned enough from doing that first project that they
1692 are preparing to commit to a second project to do the same
1693 thing. Where those EOR opportunities exist, we believe it is

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1694 critical to anchor early projects to reduce the total cost to
1695 the taxpayer, to increase the viability of the projects and
1696 to harvest the key learnings that we need to see CCS widely
1697 deployed.

1698 Mr. {Olson.} Yeah, so it sounds like they are rare.
1699 You have to have some sort of confluence with power
1700 generation with some sort of structure near the power
1701 generation to get the CO2 to use for enhanced oil recovery
1702 operations. I am out of my time. I just want to invite you
1703 back to Texas. You know, you will have your term up in DOE
1704 next four year probably. Come back to the woodlands. You
1705 know, ExxonMobil, your former company, has built a big
1706 research center up there. The one from Fairfax, Virginia is
1707 moving to Texas. So come on back. I yield back.

1708 Mr. {Murphy.} The gentleman yields back. Now recognize
1709 Mr. Griffith from Virginia for 5 minutes.

1710 Mr. {Griffith.} Thank you very much, Mr. Chairman. I
1711 do appreciate it. I have in my all-of-the-above policy, I
1712 have the four Ds, dig, drill, deregulate, and discover.
1713 Today's hearing obviously deals with discover. I do
1714 appreciate the work that you all are doing in trying to find

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1715 ways that we can discover ways that we can continue to use
1716 coal because I come from a coal mining region in central
1717 Appalachia.

1718 That being said, I have been very excited about the work
1719 that has been done by Dr. Fan at Ohio State University in
1720 regard to chemical looping, and as I understand it, last time
1721 I talked to him, he hadn't yet gotten the keys to the
1722 facility in Wilsonville, Alabama, but he was expecting to get
1723 that soon.

1724 My question is, because I see that is so exciting
1725 because we end up with, I guess, whatever remnants are left
1726 over what is a very pure burning process of the coal ash and
1727 carbon dioxide. So we eliminate most of the cost of the
1728 capture. So let us assume for the sake of argument that it
1729 is successful, and we get to September and the experiment has
1730 worked as well as all of us could hope. What is next? Where
1731 do we go? And what does DOE do? And I appreciate NETL has
1732 been involved in this project and appreciate that.

1733 But what do you all do next to try to encourage industry
1734 to go to an even larger project and actually build a plant
1735 that would use this technology that doesn't have to be near

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1736 lignite alone or any particular type of coal but could be
1737 used anywhere in the United States or the world.

1738 Mr. {Friedmann.} Again thank you for that question, and
1739 again because Mr. Klara's organization does so much of that,
1740 I will make sure he has time to answer in part. Chemical
1741 looping technology is an example of what we would call a
1742 second generation technology in these different buckets. The
1743 work that is going on in Ohio is very exciting. We have
1744 another chemical looping project as well with Austin in
1745 Connecticut. And in fact, we are in discussions right now
1746 with ARPA-E to take over that project and to see if we can't
1747 set it up at Wilsonville and give it a run.

1748 There are a series of technical challenges that come
1749 with association of scale-up demonstration and so forth. But
1750 I do want to mention that one of the interesting values of
1751 chemical looping is that it is actually a dual technology.
1752 It can be used on coal feed as well as on natural gas.

1753 Mr. {Klara.} And I would just like to add that we are
1754 doing everything we can to push that technology forward.

1755 Mr. {Griffith.} Well, and I guess my question is that
1756 assuming that it goes well, do you all think you are ready to

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1757 step in and say okay, we will help fund this at some plant
1758 because we really need some help in the coal fields? And I
1759 see this as the light at the end of the tunnel. I don't see
1760 how it can possibly be done in less than seven years, and
1761 that is with the government using the money that it has to
1762 take this discovery and make it real for people where we
1763 don't raise the cost of electricity to where people can't
1764 afford it and we continue to use the rich coal resources of
1765 central Appalachia.

1766 Mr. {Klara.} I began this job just 3 months ago, and in
1767 that context, we are considering exactly what pieces we need
1768 to build into our research portfolio. One thing that we have
1769 begun to realize is that we need second generation large
1770 pilot projects as the critical, technical undergirding of
1771 those next generation of large demonstrations. We are trying
1772 to put together the technical considerations and
1773 specifications in partnership with NETL to figure out what
1774 that will look like in terms of technical work, milestones,
1775 and costs so that we can bring forward those proposals in
1776 future budgets.

1777 Mr. {Griffith.} I appreciate that. I am concerned that

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1778 we do have the cart before the horse, and I appreciate what
1779 you all are doing moving forward. But I do think that some
1780 of the regulations coming out of your sister agency, not you
1781 all, but out of your sister agency, are making it hard for
1782 people to survive in the coal industry when we see technology
1783 coming down the pike that may very well solve the problems
1784 that a lot of times we hear of people bringing up in regard
1785 to the use of coal.

1786 I would have to say in September of 2012 testimony
1787 before the Energy and Power Subcommittee, a representative
1788 from Austin who you mentioned earlier, a maker of CCS-related
1789 technology, said that it is unaware that any supplier of CCS
1790 technology is ready or able to offer commercial guarantees
1791 for full-scale systems of carbon capture. What does a
1792 technology supplier need to know to warrant and be ensured
1793 for its CCS technologies for use in a coal power plant?

1794 Mr. {Friedmann.} Thank you. Since that time, a number
1795 of those companies have actually do now offer performance
1796 guarantees. In part, that is because we have run these large
1797 scale pilots that they need to validate their technology.
1798 And more importantly they have had installation in some of

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1799 these large-scale demonstrations. That helps provide the
1800 confidence along with other technology tools like advanced
1801 simulation to allow them to put a performance guarantee in a
1802 wrapper around those facilities.

1803 Mr. {Griffith.} All right, I appreciate that. Thank
1804 you very much. I yield back the remainder of my time, Mr.
1805 Chairman.

1806 Mr. {Murphy.} Mr. Johnson, you are now recognized for 5
1807 minutes.

1808 Mr. {Johnson.} Thank you, Mr. Chairman, and, gentlemen,
1809 thank you for being here with us today. I represent a part
1810 of our nation in eastern and southeastern Ohio that is very
1811 dependent upon the coal industry, both for the energy that we
1812 use and also for the livelihood for the people that work in
1813 the industry. So let me ask you a quick yes-or-no question
1814 to get started off right away. Do both of you believe that
1815 America can solve the technological concerns that the
1816 environmentalists have so that we can use and continue to use
1817 coal environmentally soundly? Just a quick--

1818 Mr. {Friedmann.} Unquestionably yes.

1819 Mr. {Klara.} Absolutely.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1820 Mr. {Johnson.} And do you believe that coal and the
1821 vast resources of coal that we have should comprise a
1822 significant part of our energy portfolio moving forward?

1823 Mr. {Friedmann.} Yes, I do.

1824 Mr. {Klara.} Yes.

1825 Mr. {Johnson.} Okay, well thank you. Then let me get
1826 into some specific questions. In December 2010, the DOE and
1827 NETL issued a CCS research development and demonstration
1828 roadmap. Among the goals of that roadmap was that the DOE
1829 would develop technologies that can separate capture,
1830 transport, and store CO2 using either direct or indirect
1831 systems that result in a less than 10 percent increase in the
1832 cost of energy by 2015. When does DOE and NETL anticipate
1833 demonstrating CCS systems that result in less than 10 percent
1834 increase in the cost of energy compared with the non-CCS
1835 coal-powered plants?

1836 Mr. {Friedmann.} Thank you again for that question.
1837 The issues of cost is just forward in our minds, and we are
1838 doing everything we can to reduce it. In that context, we
1839 again see sort of a 2025 timeline for this second generation
1840 of technologies to lead to 10 or 15 or 20 percent cost of

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1841 electricity increases that are retail cost.

1842 Mr. {Johnson.} Okay, Mr. Klara, any comments?

1843 Mr. {Klara.} Correct, and I just say that relative to
1844 our technology portfolio, that those technologies are in our
1845 transformational bucket of technologies. And yes, the 2025
1846 to 2030 timeframe is the current pathway.

1847 Mr. {Johnson.} Okay, your technology assessment
1848 published about a year suggests the three technologies which
1849 include sorbents and pre-combustion membranes that may have
1850 achieve the goal are only at the concept stage. Would you
1851 say that your plans of December 2010 are still on target?

1852 Mr. {Friedmann.} Yes, absolutely. In fact, we have
1853 seen great progress on a number of those which at the time
1854 were sort of leading technologies, things like advanced
1855 membranes, everything from oxygen separation membranes to CO2
1856 separation membranes. The money that we have invested has
1857 allowed those to go from sort of bench scale to small pilot
1858 testing and in one or two cases to large pilot testing. That
1859 is part of the pipeline and the pathway to that large scale
1860 commercialization.

1861 Mr. {Johnson.} Okay.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1862 Mr. {Klara.} Yeah.

1863 Mr. {Johnson.} Same thing? Over the past several
1864 years, the president's budget request for coal R&D funding
1865 has steadily declined from a request in fiscal year 2010 for
1866 \$404 million to most recent request in fiscal year 2014 for
1867 \$277 million. Congress did not agree with these levels of
1868 funding and recently passed an omnibus appropriations bill
1869 increasing the funding by more than \$100 million. So what
1870 does this say about your department's aggressive planning and
1871 the administration's priorities to advance coal technology if
1872 you are cutting funding for this work?

1873 Mr. {Friedmann.} Thank you again for that question. We
1874 recognize that the budget process is complicated, that there
1875 are many, many competing interests, and so we make our
1876 requests. And we make our recommendations to the secretary,
1877 and the secretary brings those to OMB and to the White House.
1878 And together they figure out what is in fact what they want
1879 to put into an omnibus budget.

1880 I would say that in general I think about these kinds of
1881 questions as a tradeoff with urgency. The more urgency one
1882 has, the more one is willing to spend on any particular

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1883 issue.

1884 Mr. {Johnson.} I understand the budget process, and I
1885 realize there are conflicting priorities. But do you agree
1886 with the additional funding levels that Congress has
1887 appropriated?

1888 Mr. {Friedmann.} What I would say is that we have very
1889 clear ideas about how we would use that well.

1890 Mr. {Johnson.} Good, because that was my last question.
1891 And I am sorry. I got 15 seconds so let me get that one in.
1892 Would you please submit to this subcommittee how you plan to
1893 spend this additional funding?

1894 Mr. {Friedmann.} Yeah, we will be happy to take that
1895 question for the record--

1896 Mr. {Johnson.} Okay.

1897 Mr. {Friedmann.} --and to have follow up with
1898 additional meetings.

1899 Mr. {Johnson.} All right, thank you. Mr. Chairman, I
1900 yield back.

1901 Mr. {Murphy.} The gentleman yields back. And now
1902 recognize the gentlelady from North Carolina, Ms. Ellmers,
1903 for 5 minutes.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1904 Mrs. {Ellmers.} Thank you, Mr. Chairman. And thank you
1905 to our panel. Dr. Friedmann, as I understand it, without
1906 government subsidies, and I think you have already mentioned
1907 this, the CCS demonstrations for coal plants would not be
1908 going on. Is this correct?

1909 Mr. {Friedmann.} Yes, that is correct.

1910 Mrs. {Ellmers.} Okay, can you briefly describe to me
1911 the taxpayers, how I could go home to my North Carolina
1912 taxpayers and explain to them what return they are getting
1913 for these subsidies and technology development?

1914 Mr. {Friedmann.} There is a handful benefits that come
1915 forward that I think are pretty clear. In the near term, we
1916 actually get advanced technology that can be used to underlie
1917 manufacturing in the United States. Another thing I would
1918 say is that we actually bring a lot of information back to
1919 the body public, scientific, technical engineering, and
1920 business information, economic information, which is used to
1921 make important investment decisions in the United States.

1922 I would add that our enhanced oil recovery projects
1923 provide two additional benefits. One of those is with
1924 additional secure U.S. oil supply. And the third is actually

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1925 with the tax revenues from that. Something that is lost by
1926 many people is that the additional tax returns on enhanced
1927 oil recovery actually pay for all of the government
1928 investment in a span of seven to eight years. After that, it
1929 is actually net revenue positive.

1930 Mrs. {Ellmers.} So in my understanding, and assuming
1931 that the success of the first generation technologies does
1932 take place, there really will not be wide commercial use of
1933 these things until like the 2020s. Is that correct?

1934 Mr. {Friedmann.} For widespread commercial use, yes,
1935 that is correct.

1936 Mrs. {Ellmers.} For widespread. So is this why the
1937 DOE's fiscal year 2014 congressional budget states, and I am
1938 quoting, ``in the case of electricity generation first
1939 generation CCS technology, cost is not expected to be low
1940 enough to achieve widespread deployment in this near term''?

1941 Mr. {Friedmann.} Yes.

1942 Mrs. {Ellmers.} Yes, okay. So now being that that is
1943 correct, at a coal gasification facility, the cost of
1944 electricity may be increased by 40 percent? Is this with the
1945 current carbon capture and compression technology, is this--

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1946 Mr. {Friedmann.} For the first generation technologies,
1947 yes, that is correct.

1948 Mrs. {Ellmers.} So there will be a 40 percent increase?

1949 Mr. {Friedmann.} Where deployed.

1950 Mrs. {Ellmers.} Where deployed. And, excuse me. And
1951 at a pulverized coal plant, this cost of electricity
1952 increases up to 80 percent?

1953 Mr. {Friedmann.} Yes, that is correct.

1954 Mrs. {Ellmers.} That is correct. What size commercial
1955 development for coal plants does DOE think is possible with
1956 current CCS technology given its highest costs?

1957 Mr. {Friedmann.} I am sorry. One more time. I just
1958 didn't get that.

1959 Mrs. {Ellmers.} What size commercial deployment for
1960 coal plants does DOE think is possible with current CCS
1961 technology given its high cost? What--

1962 Mr. {Friedmann.} And this point, it would be niche
1963 applications. There will be a couple of places in the
1964 country, as we heard from Mr. Olson--

1965 Mrs. {Ellmers.} Okay.

1966 Mr. {Friedmann.} --where you have the correct

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1967 confluence of opportunity, resource, and revenue.

1968 Mrs. {Ellmers.} Just and there again, and I am probably
1969 just asking you to speculate on this. But how many would you
1970 say that would be? When you say niche, are we talking about
1971 a small--like one to five?

1972 Mr. {Friedmann.} Maybe a few dozen.

1973 Mrs. {Ellmers.} A few--okay, so 24--

1974 Mr. {Friedmann.} But I would not consider that
1975 widespread.

1976 Mrs. {Ellmers.} --across the country about.

1977 Mr. {Friedmann.} Just kicking around numbers, sure.

1978 Mrs. {Ellmers.} Okay, that is good, and I appreciate
1979 that. Thank you very much. Mr. Chairman, I yield back the
1980 remainder of my time.

1981 Mr. {Murphy.} Thank you. Now recognize Mr. Long for 5
1982 minutes.

1983 Mr. {Long.} Thank you, Mr. Chairman, and thank you all
1984 for being here today and your patience so far. Mr. Klara,
1985 has the Department of Energy estimated how many billions of
1986 tons per year will need to be stored if the United States is
1987 to sequester a substantial portion of coal-based carbon

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

1988 dioxide?

1989 Mr. {Klara.} There are many estimates that are out
1990 there relative to what the future could be for CO2
1991 production.

1992 Mr. {Long.} Many estimates from the Department of
1993 Energy?

1994 Mr. {Klara.} We rely mainly on estimates from others.
1995 So for example the Intergovernmental Panel on Climate Change,
1996 the Electric Power Research Institute has looked at these.

1997 Mr. {Long.} Do you know a ballpark range on how many
1998 billions of tons they are talking about? Have you looked at
1999 any of that or not?

2000 Mr. {Klara.} Well, some of the estimates, and we could
2001 give you specifics for a record, question for the record.
2002 But some of the specifics would be looking at CCS having to
2003 handle potentially 20 percent or more of the reduction needed
2004 to get the CO2 stabilization. And yes, that could be in the
2005 range of, you know, a billion tons or more.

2006 Mr. {Long.} Billion or multiple billions?

2007 Mr. {Klara.} I would have to go back and look.

2008 Mr. {Long.} Okay, if you wouldn't mind if you could get

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2009 that for my staff, I would appreciate it.

2010 Mr. {Klara.} Yeah.

2011 Mr. {Long.} And, Dr. Friedmann, I would like to draw
2012 your attention to this major CCS, which is carbon capture and
2013 sequestration demonstration projects, project locations, and
2014 cost share. This is a document that you all provided to the
2015 committee, is it not, in your packet?

2016 Mr. {Klara.} Yes, sir.

2017 Mr. {Long.} Okay, I heard it recently mentioned that
2018 there are several capture and storage projects that are up
2019 and running now. There has been a lot of discussion on that
2020 here today. And yet from this graphic that you all provided,
2021 almost all these projects displayed have start dates that are
2022 a few years down the road, 2017, estimated start dated 2017,
2023 2019, 2016, 2012, 2017, 2014, and 2015 which are all, as I
2024 say, down the road. And according to recent congressional
2025 research report on carbon capture and sequestration, the
2026 Department of Energy has spent approximately \$6 billion on
2027 CCS since 2008, most of which came from the stimulus that was
2028 passed a few years ago. And according to the capture,
2029 transport, inject industrial scale, quantities of CO2 solely

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2030 for the purpose of carbon sequestration. Can you clarify one
2031 final time, I guess for the committee, why we are hearing
2032 different things in the sites and if you could cite any
2033 commercial scale carbon capture and sequestration projects
2034 that are currently now up and running generating electricity.

2035 Mr. {Friedmann.} Right, again so to clarify, there are
2036 a number of large-scale industrial facilities operating in
2037 the United States and around the world. There are 12 large
2038 projects which the Global CCS Institute recognizes. With
2039 respect to power generation, the closest fit in the Beulah,
2040 North Dakota plant which generates synthetic natural gas.
2041 That gas goes into the pipeline and is used to generate
2042 power. It is not a power plant per se. It is the synthetic
2043 natural gas facility.

2044 Mr. {Long.} It is a synthetic natural gas facility?

2045 Mr. {Friedmann.} Yes, it was built actually in the
2046 early 80s when there was an expectation that we would have
2047 decreased production of natural gas in the country and we
2048 needed to generate synthetic natural gas. That plant is--

2049 Mr. {Long.} They kind of missed their bet there, didn't
2050 they?

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2051 Mr. {Friedmann.} One of the reasons why we do
2052 everything we do is that the future is opaque, and it is
2053 important to prepare as many options for the market as
2054 possible.

2055 Mr. {Long.} That is why I think that the private sector
2056 should be involved in more of this than the government, but I
2057 will stick with you, Dr. Friedmann. Does the Department of
2058 Energy intend to intervene to make sitting pipelines for
2059 distant carbon injection a more realistic option? I
2060 understand this has been a barrier to some utilities who want
2061 to pursue CCS projects.

2062 Mr. {Friedmann.} What I can say is that we have--so for
2063 any project that we have been involved in, we have supported
2064 the development and deployment of those pipelines. Where we
2065 see opportunities for regional networks to emerge that would
2066 help anchor CCS industries and large coal projects, we are
2067 keenly committed to seeing those pipelines come forward. One
2068 example of this is actually the support we have given to the
2069 FutureGen project in the FutureGen Alliance and their efforts
2070 to build a pipeline within Illinois.

2071 Mr. {Long.} Okay, and, Mr. Chairman, I yield back and

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2072 thank you all again for my time.

2073 Mr. {Friedmann.} Mr. Chairman, if I can clarify
2074 something for the record.

2075 Mr. {Murphy.} Yes.

2076 Mr. {Friedmann.} Thank you. This actually had to do
2077 with respect to Representative Ellmers' questions. She was
2078 asking about the price of capture. The answers which I gave
2079 were for a high fraction of capture, basically 90 or 95
2080 percent capture. At small fractions of capture, say 50
2081 percent capture, the actual integrated cost is much less.
2082 And that is relevant with respect to how you can deploy
2083 either modular units or smaller fractions of capture on the
2084 new or existing fleets.

2085 Mr. {Murphy.} Is that a reference to a question about
2086 the 40 percent increase in costs?

2087 Mr. {Friedmann.} Yes, exactly.

2088 Mr. {Murphy.} Do you have the information, or can you
2089 provide it for this committee in addition to her question
2090 about what this breaks down to in a cost-per-megawatt
2091 generation and what this would then cost the average family?
2092 Do you have that information now, or is that something you

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2093 can get to us?

2094 Mr. {Friedmann.} We prefer to bring that to you as a
2095 question for the record and give it back to the committee
2096 later. We have many of those kinds of calculations. Again
2097 it is the excellent work of National Energy Technology and
2098 their assessment team have done that for a wide range of
2099 power plants, a wide range of technologies, and a wide range
2100 of fuel prices. We are--be happy to provide that to the
2101 committee.

2102 Mr. {Murphy.} That would help the committee and the
2103 families who are trying to pay attention to this and see what
2104 this means.

2105 Mr. {Friedmann.} Of course.

2106 Mr. {Murphy.} I now recognize Mr. Gardner for 5
2107 minutes.

2108 Mr. {Gardner.} Thank you, Mr. Chairman, and I thank the
2109 witnesses for joining us today. Mr. Klara, is it correct
2110 that successful development and deployment of second
2111 generation technologies are aware the Department of Energy
2112 expects the cost savings that may help make CCS for coal
2113 power competitive in the marketplace?

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2114 Mr. {Klara.} I mentioned earlier, but we have three
2115 buckets of technologies that we are going after. First
2116 generation, which is the technologies deployed now. Second
2117 generation is what you are referencing, and then we have
2118 transformational technologies. And with second generation
2119 technologies, we are headed toward a reduction in cost as
2120 indicated by your remark.

2121 Mr. {Gardner.} And what is NETL's assessment of the
2122 readiness of the technologies most critical to driving down
2123 costs?

2124 Mr. {Klara.} Certainly when it comes to carbon capture
2125 and storage, capture is by far the key element to drive the
2126 cost down, and that is the majority of the focus of our
2127 research program.

2128 Mr. {Gardner.} Have any of these second generation
2129 technologies have been taken to the demonstration phase to
2130 validate they work at commercial scale in a coal-fired power
2131 plant?

2132 Mr. {Klara.} Not at this time, second--

2133 Mr. {Gardner.} Not at this time?

2134 Mr. {Klara.} Yeah, so demonstration of those would be

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2135 part of your planning.

2136 Mr. {Gardner.} Dr. Friedmann, about how much of DOE's
2137 \$7.6 billion over the past decade has been dedicated towards
2138 the second generation technologies?

2139 Mr. {Friedmann.} The overwhelming majority of the \$7.6
2140 billion that we have dedicated so far is actually to the
2141 large-scale commercial demonstrations. So but in that
2142 context, to generate and develop the second demonstration
2143 technologies, as you said, we have put already several
2144 hundred millions of dollars into that research effort.

2145 Mr. {Gardner.} Okay, and the information that I have
2146 says that we spent around \$3 billion towards the second
2147 generation technologies. Would that be correct, of the \$7.6
2148 billion?

2149 Mr. {Friedmann.} No, I don't think that is correct
2150 actually.

2151 Mr. {Gardner.} Okay, maybe we can get--

2152 Mr. {Friedmann.} We would be happy to clarify that.
2153 Yes, sir.

2154 Mr. {Gardner.} When do you expect demonstrations of
2155 these second generation technologies will be completed?

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2156 Mr. {Friedmann.} The question is actually how quickly
2157 can we pilot them first. That is the critical lynchpin.
2158 Once they have been piloted at say that 20 to 50-megawatt
2159 scale, then the next step is commercial demonstration.

2160 Mr. {Gardner.} Okay, and how long until pilot?

2161 Mr. {Friedmann.} One of those technologies is in fact
2162 being piloted now. For most of them, it is a question of,
2163 you know, how quickly can we put together the project.

2164 Mr. {Gardner.} Okay, and so major scale, that is 20 to
2165 50--what did you say 20 to 50?

2166 Mr. {Friedmann.} We are looking for--the soonest that
2167 we could get a second generation pilot up would be in
2168 2015/2016 kind of timeline for solicitation, maybe 2018
2169 demonstration, and then large-scale demonstrations of those
2170 technologies between 2018 and 2025.

2171 Mr. {Gardner.} Okay, and do you or Mr. Klara have an
2172 estimate for when those technologies will be available
2173 commercially, warrantable, insurable, fundable on the open
2174 market?

2175 Mr. {Friedmann.} For the second generation
2176 technologies, again, you need to have the large-scale pilots

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2177 before they can get to a warranty stage.

2178 Mr. {Gardner.} And you said around 2022 would be about
2179 when they get to demonstration?

2180 Mr. {Friedmann.} You might be able to do things sooner
2181 than that. I would point actually to an existing program we
2182 have under our cross-cutting budget line which is the carbon
2183 capture simulation initiative in which we are trying to use
2184 advanced super-computing technology to accelerate the
2185 sureness by which companies can provide those kind of
2186 performance guarantees.

2187 Mr. {Gardner.} So would it be safe to say that we are
2188 looking at, you know, based on current cost estimates,
2189 commercially warrantable, insurable, and fundable on the open
2190 market, we are looking at around 2030 or so, maybe beyond
2191 that?

2192 Mr. {Friedmann.} Sooner than that, but 2020 to 2025
2193 timeframe, yes.

2194 Mr. {Gardner.} Okay, can you describe in lay terms what
2195 the scale of cost savings will be expected for the so-called
2196 second generation technologies?

2197 Mr. {Friedmann.} To a first cut, we expect the cost to

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2198 cut in half. We expect them to come in at something like \$40
2199 to \$60 a ton for an integrated system.

2200 Mr. {Gardner.} And you are also working what you call
2201 transformational technologies. What would be the cost
2202 savings of these expected transformational technologies?

2203 Mr. {Friedmann.} Again on a thermodynamic and an
2204 engineering basis, they can get maybe another \$10, another
2205 \$15 a ton cheaper. So something on the order of \$30 a ton is
2206 probably about the limit of what you can reasonably expect.

2207 Mr. {Gardner.} And so when do you expect the
2208 demonstrations of those transformation technologies to be
2209 completed?

2210 Mr. {Friedmann.} Again we have laid out our road map,
2211 and we are hoping to see those deployed in the field by 2025.

2212 Mr. {Gardner.} Okay, deployed in the field
2213 commercially?

2214 Mr. {Friedmann.} Yeah.

2215 Mr. {Gardner.} Okay, at what price of CO2 capture per
2216 ton or percentage of capture will the cost be low enough to
2217 put a system on a level playing field economically with
2218 traditional coal-fueled electrical power production?

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2219 Mr. {Friedmann.} I honestly don't understand your
2220 question.

2221 Mr. {Gardner.} So basically at what, the price point,
2222 the break point of CO2 capture per ton or percentage of
2223 capture will the cost be low enough? Basically when will
2224 this be economic, low enough to put a system on a level
2225 playing field economically with traditional coal-fueled
2226 electrical power production?

2227 Mr. {Friedmann.} It is my contention that the second
2228 generation technologies are going to be the clean energy
2229 choice in terms of a competitive market in a variety of
2230 markets. In some markets, they won't be. In some markets,
2231 they will be. And the transformational technology would just
2232 increase the market share at that time.

2233 Mr. {Gardner.} But in terms of the cost, you know,
2234 putting it on a level playing field from where we are today
2235 with costs from where you want to be with these new
2236 technologies cost. Do you have estimates? Have you produced
2237 estimates and that will produce estimates of when this break
2238 point will be?

2239 Mr. {Friedmann.} Again all environmental technologies

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2240 add cost. So it is not appropriate nor do we for the purpose
2241 of policy decision compare the cost of carbon capture and
2242 storage with an unretrofitted plant or with a new build plant
2243 without it. We do that to demonstrate the delta, but a clean
2244 plant is not comparable to a Dickensian plant. They are
2245 different things.

2246 Mr. {Gardner.} Okay, if you could supply any cost
2247 estimates that you have made, comparisons to the committee,
2248 that would be fantastic. And have any of your estimates
2249 changed in light of current market conditions?

2250 Mr. {Friedmann.} First of all, we are happy to provide
2251 those numbers. The market conditions are constantly
2252 changing. We actually try to bring that uncertainty into the
2253 way that we make our price calculations in terms of
2254 availability for labor, availability for materials, global
2255 markets for things, and so forth. In that context, as the
2256 market has changed, our estimates don't change as much as you
2257 might guess. Some of that information is baked into the way
2258 we do the calculations.

2259 Mr. {Gardner.} Thank you. And thank you, Mr. Chairman,
2260 for being generous of time.

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2261 Mr. {Murphy.} Thank you, and although we are done, I am
2262 going to recognize Ms. Schakowsky for a quick clarifying
2263 question, comment, and then I will have a final clarifying
2264 question.

2265 Ms. {Schakowsky.} Thank you, Mr. Chairman. First, I
2266 want to say, Dr. Friedmann, you are one of the best witnesses
2267 that I have heard before this committee, and your answers are
2268 informative and concise and I think very fair. And I
2269 appreciate that. I hope I speak for the rest of the
2270 committee. When we talk about the cost of CCS and you
2271 estimate that, I just wanted to clarify, you aren't
2272 considering that at some point there may be a cost for carbon
2273 emissions. I know that the major oil companies have already
2274 built into their business plants that there may at some point
2275 in the not-too-distant future be some sort of perhaps a
2276 carbon tax, some sort of cost. So when you estimate the cost
2277 of this technology and applying it primarily we are talking
2278 about to coal today, you aren't taking into consideration any
2279 kind of cost for the pollution that these plants produce, are
2280 you?

2281 Mr. {Friedmann.} Let me take just a minute to answer

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2282 that if I may.

2283 Ms. {Schakowsky.} Okay.

2284 Mr. {Friedmann.} Again thank you for the question and
2285 for your compliment. It was very nice of you to say so.
2286 Shell Oil Company has announced that they use a \$50-a-ton
2287 estimate for carbon dioxide for any project that they put
2288 together. Other companies, most Fortune 500 companies have a
2289 similar kind of number which they keep in terms of how they
2290 assist risk in a carbon-constrained future.

2291 We do not actually use those numbers to estimate cost of
2292 capture. Those are straight-up technical calculations based
2293 on the facility, the technology, the rank of coal, et cetera.
2294 What we do is we think about deployment in the context of
2295 those costs. Cost of carbon is something which is actually
2296 outside of what the Department of Energy does, but we do
2297 believe that we are in a carbon-constrained world and that
2298 increasingly the cost of carbon dioxide emissions will be
2299 internalized into the cost of doing business.

2300 As that happens, it is our privilege and our pleasure
2301 and my passion to find ways to drop the cost so that that
2302 deployment of clean energy technology can be as widely

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2303 successful as possible to create the brightest possible clean
2304 energy future for the United States.

2305 Ms. {Schakowsky.} Perfect ending as far as I am
2306 concerned. Thank you.

2307 Mr. {Murphy.} Thank you, and I have a clarifying
2308 question here too with it. So you mentioned about Kemper.
2309 They have that advantage of being able to use enhanced oil
2310 recovery from their plant. Different coal plants around the
2311 nation may not have that same advantage. And as you were
2312 preparing information for us, would you let us know what you
2313 believe the costs are for new plants or retrofitting old
2314 plants?

2315 Mr. {Friedmann.} Um-hum.

2316 Mr. {Murphy.} Give us some comparisons and having that
2317 public because we would like the companies themselves to be
2318 able to respond to those estimates if you would be able to
2319 get that for us.

2320 Mr. {Friedmann.} Yeah, we would be happy to.

2321 Mr. {Murphy.} Thank you.

2322 Mr. {Friedmann.} Let me add that the availability of
2323 EOR doesn't affect the cost of the project. It affects the

This is a preliminary, unedited transcript. The statements within may be inaccurate, incomplete, or misattributed to the speaker. A link to the final, official transcript will be posted on the Committee's website as soon as it is available.

2324 revenue, and so that of course affects the economics. But we
2325 try to keep the revenues and the benefits and the costs in
2326 separate categories for exactly that kind of comparison.

2327 Mr. {Murphy.} Thank you. And also for the sake of the
2328 American people, to help us translate that into what is going
2329 to be the cost for homeowners in order to make these kind of
2330 transitions as well as for businesses so we all share a
2331 concern that energy cost increasing means the impact upon
2332 manufacturing. We see that affecting some countries in the
2333 EU as well.

2334 So thank you, and I echo the comments of Ms. Schakowsky.
2335 Dr. Friedmann and Mr. Klara, you have been very informative.
2336 We appreciate just giving us the facts. That was very
2337 helpful and will help us moving forward. So I want to thank
2338 both the witnesses that participated in today's hearing and
2339 remind members they have 10 business days to submit questions
2340 for the record, and I ask you to respond to questions
2341 promptly. And we will leave it at that. So with that again
2342 I thank the panel, and this hearing is adjourned.

2343 [Whereupon, at 12:03 p.m., the Subcommittee was
2344 adjourned.]
