Technologies that can be used to improve fuel economy can also be used to increase other vehicle attributes, especially acceleration performance, weight, and energy-using accessories. While this is most obvious for technologies that improve the efficiency of engines and transmissions, it is also true of technologies that reduce mass, aerodynamic drag, rolling resistance or any road or accessory load. The exact nature of the potential to trade-off attributes for fuel economy varies with the technology, but at a minimum, increasing vehicle efficiency or reducing loads allows a more powerful engine to be used while achieving the same level of fuel economy. How consumers value increased fuel economy and how fuel economy regulations affect manufacturers' decisions about how to use efficiency improving technologies

can have important effects on the estimated costs, benefits, and indirect impacts of fuel economy standards.

NHTSA's preliminary regulatory impact analysis assumes that consumers will purchase, and manufacturers will supply, fuel economy technologies in the absence of fuel economy standards if the technology "pays for itself" in fuel savings over the first 30 months vehicle use. This assumption is based on statements manufacturers have made to us and to NASEM CAFE committees and has been deployed in NHTSA's prior analyses of fuel economy standards. However, classical economic concepts suggest that deploying this assumption may be problematic when the baseline standards are binding—meaning that they constrain consumers' behavior to vehicles that are more fuel efficient than they would have chosen in the absence of fuel economy standards. To demonstrate this, we introduce a standard economic model of consumer optimization subject to a budgetary constraint.<sup>336</sup>

**Figure III-17 – Constrained Optimization Model of Consumer Preferences Between Horsepower and Fuel Economy in the Absence of Fuel Economy Standards**

Figure III-17 models consumer behavior when constrained by a budget. Line B1 represents the consumer's original budget constraint. Curve I1 is called an indifference curve, which shows each combination of horsepower, which we use here to represent a variety of attributes that could be traded-off for

increased fuel economy, and fuel savings between which a consumer is indifferent. The curvature of the indifference curve reflects the principle of diminishing marginal utility—the idea that consumers value consumption of the first unit of any product greater than subsequent units. Curve I1

represents the highest utility achievable when subject to budget constraint B1, as the consumer may select the combination of performance and fuel economy represented by point (HP1, FS1)—which is the point of tangency between I1 and B1. When new technology becomes available that

<sup>336</sup> Note that the following section examines whether consumers are rational in their fuel

economy consumption patterns. This analysis could represent a scenario where consumers are rational,

or one in which the underweight future fuel savings in their car purchasing decisions.

makes either fuel economy or performance (or both) more affordable, the consumer's budget constraint shifts from B1 to B2, and the consumer can

now achieve the point of tangency between I2 and B2 (HP2, FS2). In this case, both fuel economy and performance are modeled as normal

goods—meaning that as they become more affordable, consumers will elect to consume more of each.

**Figure III-18 – Constrained Optimization Model of Consumer Preferences Between Horsepower and Fuel Economy in the Presence of Binding Fuel Economy Standards**

A different analysis is required when fuel economy standards also bind on consumer decisions. Here, minimum fuel economy standards eliminate some combinations of performance and fuel economy, creating a corner solution in the budget constraint. Figure III-18 shows this effect, as the consumer will elect the point of tangency with budget constraint B1 at the corner solution at (HP1 and FS1), which is also the minimum fuel economy standard. When new technology is introduced (or becomes cheaper) which makes fuel economy and performance more

affordable, the consumer's budget constraint shifts from B1 to B2 again, but the existing fuel economy standard is still binding, so a corner solution remains at FS1. The consumer will choose the corner combination of fuel economy and performance again, where I2 is tangent with B2, at point (FS1, HP2). *Note that the consumer has elected to improve performance from HP1 to HP2 but has not elected to improve fuel economy.*

This model implies that fuel economy standards prevent consumers from achieving their optimal bundle of fuel

economy and performance given their current preferences, creating an opportunity cost to consumers in the form of lost performance. The constrained optimization model can be slightly tweaked to show this loss to consumers. In this example, the y-axis uses the composite good M reflecting all other goods and services, including performance. This makes the interpretation of the y axis simpler, as it can be more easily translated into dollars.

**Figure III-19 – Constrained Optimization Model of Consumer Preferences Between Horsepower and Fuel Economy Showing Opportunity Cost of Fuel Economy Standards**

Figure III-19 shows the effect of new binding fuel economy standards on consumer behavior. The consumer begins at point (M1, FS1) on indifference curve I1. If more stringent fuel economy standards were in place, the consumer would shift to the lower indifference curve I2—reflecting a lower level of utility—and would consume at point (M2, FS2). One concept from the economics literature for valuing the change in welfare from a change in prices or quality (or in this case fuel economy standards) is to look at the compensating variation between the

original and final equilibrium. The compensating variation is the amount of money that a consumer would need to return to their original indifference curve.<sup>337</sup> It is found by finding the point of tangency with the new indifference curve at the new marginal rate of substitution between the two products and finding the equivalent point on the old indifference curve. Figure III-19 shows this as the distance between points A and B on the Y-axis.<sup>338</sup>

The above logic appears to explain the trends in fuel economy and vehicle performance (measured by horsepower/

pound) between 1986 and 2004, when gasoline prices fluctuated between \$2.00 and \$2.50 per gallon and new light duty vehicle fuel economy standards remained nearly constant Figure III-20. Over the same period numerous advanced technologies with the potential to increase fuel economy were adopted. However, the fuel economy of new light duty vehicles did not increase. In fact, increases in the market share of light trucks caused fuel economy to decline somewhat.

<sup>337</sup> There is a very similar concept for valuing this opportunity cost known as the equivalent variation. NHTSA presents the compensating variation here

for simplicity but acknowledges that the equivalent variation is an equally valid approach.

Sources: EPA 2020 Automotive Trends Report; EIA Monthly Energy Review, 5/21; Federal Reserve Bank of St. Louis, CPI-U

**Figure III-20 – Test Cycle Combined Fuel Economy and Gasoline Price: 1975-2020**

On the other hand, from 1986–2004 the acceleration performance of light-duty vehicles increased by 45% (Figure III-21). Advances in engine technology are reflected in the steadily increasing ratio of power output to engine size, measured by displacement. Without increased fuel economy standards, all the potential of advanced technology appears to have gone into increasing performance and other attributes (for example average weight also increased by 27% from 1986–2004) and none to increasing fuel economy. Fuel economy remained nearly constant at the levels

required by the car and light truck standards, consistent with the idea the standards were a binding constraint on the fuel economy of new vehicles. The pattern for periods of price shocks and increasing standards is different, however, as can be seen in Figure III-20. In the early period up to 1986, there is almost no change in performance and vehicle weight decreased. However, in the more recent period post-2004, performance continued to increase although apparently at a slower rate than during the 1986–2004 period and vehicle weight changed very little. The

large and rapid price increases appear to have been an important factor. Even before manufacturers can respond to prices and regulations by adding fuel economy technologies to new vehicles, demand can respond by shifting towards smaller, lighter and less powerful makes and models. The period of voluntary increase in fuel economy is consistent with the constrained optimization problem presented above if fuel economy standards no longer constrained consumer behavior after the change in fuel prices.

**Figure III-21 – Trends in Performance and Engine Technology: 1975-2020**

If this constrained optimization model is a reliable predictor of consumer behavior for some substantive portion of the new vehicle market, it would have important implications for how NHTSA models baseline consumer choices. In this case, it would mean that as technology that could improve fuel economy is added absent standards, it would be primarily geared towards enhancing performance rather than fuel economy. Depending on how consumers value future fuel savings, it might be appropriate for NHTSA to change its methods of analysis to reflect consumer preferences for performance, and to develop methods for valuing the opportunity cost to consumers for constraining them to more fuel efficient options. NHTSA seeks comment on the analysis presented in this section and its implications for the assumptions that consumers will add technologies that payback within thirty months. It also seeks comment on possible approaches to valuing the opportunity cost to consumers.

#### Potential Implications of Behavioral Theories for Fuel Economy Standards

In this proposed rule, the cost-effectiveness of technology-based fuel economy improvements is used to estimate fuel economy improvements by manufacturers in the No-Policy case and to estimate components of the benefits and costs of alternative increases in fuel economy standards. In the interest of insuring that our theory and methods

reflect the best current understanding of how consumers perceive the value of technology-based fuel economy improvements, we are seeking comment on our current, and possible alternative representations of how consumers value fuel economy when purchasing a new vehicle and while owning and operating it, and how manufacturers decide to implement fuel economy technologies.<sup>339</sup> We are particularly interested in comments on our assumption that in our Alternative 0 (no change in existing standards) manufacturers will implement technologies to improve fuel economy even if existing standards do not require them to do so, provided that the first 30 months of fuel savings will be greater than or equal to the cost of the technology. We are also interested in comments concerning our use of the difference between the price consumers pay for increased fuel economy and the value of fuel savings over the first 30 month for estimating the impacts of the standards on new and used vehicle markets. Finally, we are interested in comments on when attributes that can be traded-off for increased fuel economy should be considered opportunity costs of increasing fuel economy.

<sup>339</sup> We are making a distinction between consumers choices when presented with technology-based fuel economy improvements versus consumers' choices among various makes and models of vehicles. The latter topic is also of interest and is discussed in (see TSD, Ch. 4.2.1).

How manufacturers choose to implement technologies that can increase fuel economy depends on consumers' willingness to pay (WTP) for fuel economy and the other attributes the technologies can improve. Consumers' WTP for increasing levels of an attribute defines the consumers' demand function for that attribute. Here, we consider how consumers' WTP for increased fuel economy ( $WTP_{FE}$ ) and for performance ( $WTP_{HP}$ ), where  $FE$  stands for fuel economy and  $HP$  stands for "Horse Power"/performance, and the cost of technology ( $C$ ) affect manufacturers' decisions about how to implement the technologies with and without fuel economy standards. For the purpose of this discussion, it is convenient to think of fuel economy in terms of its inverse, the rate of fuel consumption per mile. While miles per gallon (mpg) delivers decreasing fuel savings per mpg, decreasing fuel consumption delivers constant fuel savings per gallon per mile (gpm) reduced. Thinking in terms of gpm is appropriate because fuel economy standards are in fact defined in terms of the inverse of fuel economy, *i.e.*, gpm.

In the CAFE Model we typically assume that for a technology that can improve fuel economy, consumers are willing to pay an amount equal to the first thirty months of fuel savings ( $WTP_{30FE}$ ). This is an important assumption for several reasons. The market will tend to equilibrate the ratio of consumers' WTP for fuel economy

divided by its cost to the ratio of consumers' WTP for other attributes divided by their cost. The value of the first thirty months of fuel savings is typically about one-fourth of the value of savings over the expected life of a vehicle, discounted at annual rates between 3% and 7%. Arguably, this represents an important undervaluing of technology-based fuel economy improvement relative to its true economic value. Our use of the 30-month payback assumption is based on statements manufacturers have made to us and to NASEM CAFE committees. It is also based on the fact that repeated assessments of the potential for technology to improve fuel economy have consistently found a substantial potential to cost-effectively increase fuel economy. But it is also partly based on the fact that the substantial literature that has endeavored to infer consumers' WTP for fuel economy is approximately evenly divided between studies that support severe undervaluation and those that support valuation at approximately full lifetime discounted present value (e.g., Greene et al., 2018; Helfand and Wolverton, 2011; Greene, 2010; for a more complete discussion see TSD, Ch. 6.1.6). The most recent studies based on detailed data and advanced methods of statistical inference have not resolved the issue (NASEM, 2021, Ch. 11.3).

If consumers value technology-based fuel economy improvements at only a small fraction of their lifetime present value and the market equates  $WTP_{30FE}/C$  to  $WTP_{HP}/C$ , the market will tend to oversupply performance relative to fuel economy (Allcott et al., 2014; Heutel, 2015). The  $WTP_{30FE}$  assumption also has important consequences when fuel economy standards are in effect. Alternative 0 in this proposed rule

assumes not only that the SAFE standards are in effect but that the manufacturers who agreed to the California Framework will be bound by that agreement. If those existing regulations are binding, it is likely that  $WTP_{HP} > WTP_{30FE}$ . (For simplicity we assume that over the range of fuel economy and performance achievable by the technology, both WTP values are constant.)<sup>340</sup> This outcome would be expected in a market where consumers undervalue fuel savings in their normal car buying decisions and standards require levels of fuel economy beyond what they are willing to pay.<sup>341</sup> This is illustrated in Figure III–22. The initial consumer demand function for vehicles ( $D_0$ ) is shifted upward by  $WTP_{30FE}$  to represent the consumer demand function for the increased fuel economy the technology could produce ( $D_{30FE}$ ) and by  $WTP_{HP}$  to represent the demand function ( $D_{HP}$ ) for the potential increase in performance. Because the technology has a cost (C), the manufacturers' supply function ( $S_0$ ) shifts upward to  $S_1 = S_0 + C$ .<sup>342</sup> If the cost of the technology

<sup>340</sup> Although there are diminishing returns to increased miles per gallon, in terms of fuel savings in gallons or dollars, there are not diminishing returns to reductions in fuel consumption per mile, except due to decreasing marginal utility of income.  $WTP_{HP}$  likely decreases with increasing performance, but if the changes are not too large, the assumption of constant WTP is reasonable.

<sup>341</sup> If there are no binding regulatory constraints and fuel economy and other vehicle attributes are normal goods, consumers will elect more of each in the event technological progress makes it possible to afford them. This simplifying assumption is consistent with a scenario where consumers' baseline vehicle choices are constrained by regulatory standards. See above for more discussion.

<sup>342</sup> The supply function for new cars is assumed to be perfectly elastic for the sake of simplicity of exposition. Note that if the cost of the technology exceeds consumers' WTP for both fuel economy and performance, the technology will not be adopted in the absence of regulations requiring it.

exceeds consumers' WTP for either the fuel economy or the performance it can deliver, the technology will not be adopted in the absence of regulations requiring it. In Figure III–22 we show the case where  $C < WTP_{30FE} < WTP_{HP}$ . In this case, using the technology to increase performance provides the greatest increase in sales and revenues:  $Q_{HP} > Q_{30FE} > Q_0$ . Since both WTP values are assumed to be approximately constant over the range of improvement the technology can provide, there is no possible combination of fuel economy and performance improvement that would produce a larger increase in sales than using the technology entirely to increase performance.<sup>343</sup> Importantly, as long as  $C < WTP_{HP}$ , the actual cost of the technology does not affect the manufacturer's decision to use 100% of its potential to increase performance and 0% to increase fuel economy. The technology's payback period for the increase in fuel economy is irrelevant. If we reverse the relative WTP values (i.e.,  $WTP_{30FE} > WTP_{HP}$ ), then the manufacturer will choose to use 100% of the technology's potential to increase fuel economy and 0% to increase performance, assuming constant WTP values.<sup>344</sup> This conclusion may contradict our current method, which assumes that even with increasing fuel economy standards in Alternative 0, manufacturers will adopt fuel economy technologies with  $WTP_{30FE} < C$  and use them to increase fuel economy rather than performance.

<sup>343</sup> In fact, all that is required is that over the range of increases achievable by the technology,  $WTP_{HP} > WTP_{FE}$ .

<sup>344</sup> However, as noted above, the market will tend to equate  $WTP_{HP}/C$  to  $WTP_{FE}/C$ , so if there is sufficient variation in  $WTP_{HP}$  over the range of values achievable by the technology, some of each will be provided.

**Figure III-22 – Manufacturers Decision to Adopt a Technology When  $WTP_{HP} > WTP_{30FE} > C$**

Because the expected present value of fuel savings is several times the 30-month value, it is quite possible that the WTP for performance lies between the lifetime present value of fuel savings and the 30-month value:  $WTP_{PVFE} > WTP_{HP} > WTP_{30FE}$ . This possibility is illustrated in Figure III-23, in which there are three demand functions in addition to the initial demand function,  $D_0$ . In Figure III-23, if the consumer were willing to pay for the full present value of fuel savings, the technology would be applied 100% to increasing fuel economy, provided  $C < WTP_{PVFE}$ . But if standards were binding and the consumer were willing to pay for only 30 months of fuel savings, the technology would be applied 100% to increasing performance, provided  $C < WTP_{HP}$ . Suppose that the cost of the technology is not  $C$ , but a much smaller value, say  $c < C$  and  $c < WTP_{30FE}$ . Assuming consumers value increased fuel economy at  $WTP_{30FE}$ , it remains the case that all the technology's potential will be applied to increasing performance because that gives the greatest increase in sales. The implication is that when there is a binding fuel economy standard, as long as  $WTP_{HP} > WTP_{30FE}$ , no technologies would be used to increase fuel economy in the absence of a regulatory requirement to do so. If consumers' WTP for fuel economy is  $WTP_{30FE}$  and regulatory standards are binding,  $WTP_{HP} > WTP_{FE}$  seems likely.

If  $WTP_{30FE} < WTP_{HP}$  (recalling that HP can represent attributes in addition to fuel economy), the above analysis of producer behavior contradicts the current operation of the CAFE Model, which assumes that manufacturers will apply technologies whose costs are less than  $WTP_{30FE}$  to improving fuel economy in the absence of regulations requiring them to do so. For the final rule, NHTSA is considering changing the assumption that in the absence of standards that require it, manufacturers will adopt technologies to improve fuel economy that have a payback period of 30 months or less, in favor of the above analysis. We are interested in receiving comments that specifically address the validity of the current and proposed approach.

As discussed in TSD Chapter 4.2.1.1, there is no consensus in the literature about how consumers value fuel economy improvements when making vehicle purchases. In this and past analyses, we have assumed that consumers value only the first 30 months of fuel savings when making vehicle purchase decisions. This value is a small fraction, approximately one fourth of the expected present value of future fuel savings over the typical life of a light-duty vehicle, assuming discount rates in the range of 3% to 7% per year. On the other hand, when estimating the societal value of fuel economy improvements, we use the full present value of discounted fuel savings

over the expected life of the vehicle because it represents a real resource savings. However, the possibility that consumers' perceptions of utility at the time of purchase (decision utility) may differ from the utility consumers experience while consuming a good and that experienced utility may be the preferable metric for policy evaluation has been raised in the economic literature (Kahneman and Sugden, 2005). In our methods, we use  $WTP_{30FE}$  to represent consumers' decision utility. Gallons saved over the life of a vehicle, valued at the current price of gasoline, and discounted to present value appears to be an appropriate measure of experienced utility. The large difference between our measure of decision utility and lifetime present value fuel savings as a measure of experienced utility has potentially important implications for how we estimate the impacts of fuel economy standards on new vehicle sales and the used vehicle market. It seems plausible that as consumers experience the fuel savings benefits of increased fuel economy, their valuation of the fuel economy increases required by regulation may adjust over time towards the full lifetime discounted present value. In addition, behavioral economic theory accepts that consumers' willingness to pay for fuel economy may change depending on the context of consumers' car purchase decisions. The implications of such possibilities are analyzed below. We are interested in

how they might affect our current methods for estimate the impacts of standards on new vehicle sales and the used vehicle market, and whether any changes to our current methods are appropriate.

The existence of fuel economy standards changes manufacturers' decision making. First, if a standard is set at a level that requires only part of the technological potential to increase fuel economy, if  $C < WTP_{HP}$ , and  $WTP_{HP} > WTP_{30FE}$ , the remainder of the technology's potential will be used to provide some increase in performance. This appears to have occurred post 2004 when the rate of improvement in performance slowed while fuel

economy improved. Assuming that consumers value fuel economy improvement at time of purchase at  $WTP_{30FE}$ , there would be a consumers' surplus cost of foregone performance equal to the cross-hatched trapezoid in Figure III-23. The foregone performance cost will be less than what it would have been if none of the technology's potential to increase fuel economy were used to increase performance. Even if the cost of the technology is less than  $WTP_{30FE}$ , the technology will be applied to improve fuel economy only up to the required level and the remainder of its potential will be used to increase performance. If the cost of applying

enough of the technology to achieve the fuel economy standard is greater than  $WTP_{HP}$ , there would be no cost of foregone performance since the cost of applying the technology to increasing fuel economy exceeds its opportunity cost when applied to increase performance.<sup>345</sup> In that case, the technology cost represents the full cost of the fuel economy improvement, since that cost exceeds consumers' WTP for the performance it could produce. On the other hand, if under regulatory standards consumers valued fuel economy at  $WTP_{PVFE}$ , there would also be no opportunity cost of performance because  $WTP_{PVFE} > WTP_{HP}$ .

Figure III-23 – Manufacturers’ Decision to Adopt Technology with Fuel Economy Standards

Because the CAFE Model estimates the effects of standards on new vehicle sales and scrappage based on the difference between the cost of technology and the perceived value of fuel savings at the time a new vehicle is purchased, whether consumers perceive the value differently in regulated and unregulated markets is an important question. Traditional utility theory of consumer decision making does not allow that consumers' preference rankings depend on the context of the choices they make.

However, in addition to the theory of utility maximizing rational economic behavior, modern economics includes the insights and findings of behavioral economics, which has established many examples of human decision making that differ in important ways from the rational economic model. In particular, the behavioral model allows the possibility that consumers' preferences and decision-making processes often do change depending on the context or framing of choices. The possibility that behavioral theories of decision making

may be useful for understanding how consumers value fuel economy and for evaluating the costs and benefits of fuel economy standards was noted in the most recent NASEM (2021) report. An explanation of the different contexts helps to illustrate this point. If a consumer is thinking about buying a new car and is looking at two models, one that includes fuel economy technology and is more expensive and another that does not, she may buy the cheaper, less fuel efficient version even if the more expensive model will save

<sup>345</sup> This is because using the technology to increase performance would not be the second-best

use of the cost of increasing fuel economy. The

second-best use would instead be to invest the cost at a market rate of return.

money in the long run. But if, instead, the consumer is faced with whether to buy a new car at all as opposed to keeping an older one, if all new cars contain technology to meet fuel economy standards then she may view the decision differently. Will, for example, an extra \$1,000 for a new car—a \$1,000 that the consumer will more than recoup in fuel savings—deter her from buying the new car, especially when most consumers finance cars over a number of years rather than paying the \$1,000 cost up front and will therefore partly or entirely offset any increase in monthly payment with lower fuel costs? In addition, the fact that standards generally increase gradually over a period of years allows time for consumers and other information sources to verify that fuel savings are real and of substantial value.

The CAFE Model's representation of consumers' vehicle choices under regulation reflects the "Gruenspecht Effect", the theory that regulation will inevitably cause new vehicles to be less desirable than they would have been in the absence of regulation, which will inevitably lead to reduced new vehicle sales, higher prices for used vehicles and slower turnover of the vehicle stock. However, if consumers severely undervalue fuel savings at the time of vehicle purchase, not only is that itself a market failure (a large discrepancy between decision and experienced utility) but it raises important questions about what causes such undervaluation and whether consumers' perceptions may change as the benefits of increased fuel economy are realized or whether the different framing of new vehicle choices in a regulated market might partially or entirely mitigate that undervaluation. The 2021 NASEM report asserts that if the behavioral model is correct, consumers might value fuel savings at or near their full lifetime discounted present value, potentially reversing the Gruenspecht Effect.

"On the other hand, the Gruenspecht effect is not predicted by the behavioral model, under which it is not only possible but likely that if the fuel savings from increased fuel economy exceed its cost, consumers will find the more fuel-efficient vehicles required by regulation to be preferable to those that would otherwise have been produced." "It is possible that sales would increase rather than decrease and likewise manufacturers' profits. In that case, increased new vehicle sales would reduce used vehicle prices, benefiting buyers of used vehicles and accelerating the turnover of the vehicle stock."<sup>346</sup>

NHTSA is interested in comments that can help contribute to resolving or improving our understanding of this issue and its implications for how the costs and benefits of fuel economy standards should be estimated.

#### (2) Refueling Benefit

Increasing CAFE standards, all else being equal, affect the amount of time drivers spend refueling their vehicles in several ways. First, they increase the fuel economy of ICE vehicles produced in the future, which increases vehicle range and decreases the number of refueling events for those vehicles. Conversely, to the extent that more stringent standards increase the purchase price of new vehicles, they may reduce sales of new vehicles and scrapping of existing ones, causing more VMT to be driven by older and less efficient vehicles which require more refueling events for the same amount of VMT driven. Finally, sufficiently stringent standards may also change the number of electric vehicles that are produced, and shift refueling to occur at a charging station, rather than at the pump—changing per-vehicle lifetime expected refueling costs.

The agency estimates these savings by calculating the amount of refueling time avoided—including the time it takes to find, refuel, and pay—and multiplying it by DOT's value of time of travel savings estimate. For a full description of the methodology, refer to TSD Chapter 6.1.4.

#### (3) Additional Mobility

Any increase in travel demand provides benefits that reflect the value to drivers and other vehicle occupants of the added—or more desirable—social and economic opportunities that become accessible with additional travel. Under the alternatives in this analysis, the fuel cost per mile of driving would decrease as a consequence of the higher fuel economy levels they require, thus increasing the number of miles that buyers of new cars and light trucks would drive as a consequence of the well-documented fuel economy rebound effect.

The fact that drivers and their passengers elect to make more frequent or longer trips to gain access to these opportunities when the cost of driving declines demonstrates that the benefits they gain by doing so exceed the costs they incur. At a minimum, the benefits must equal the cost of the fuel consumed to travel the additional miles (or they would not have occurred). The cost of that energy is subsumed in the simulated fuel expenditures, so it is necessary to account for the benefits

associated with those miles traveled here. But the benefits must also offset the economic value of their (and their passengers') travel time, other vehicle operating costs, and the economic cost of safety risks due to the increase in exposure that occurs with additional travel. The amount by which the benefits of this additional travel exceeds its economic costs measures the net benefits drivers and their passengers experience, usually referred to as increased consumer surplus.

TSD Chapter 6.1.5 explains the agency's methodology for calculating additional mobility.

### 2. External Costs and Benefits

#### (a) Costs

##### (1) Congestion and Noise

Increased vehicle use associated with the rebound effect also contributes to increased traffic congestion and highway noise. Although drivers obviously experience these impacts, they do not fully value their impacts on other system users, just as they do not fully value the emissions impacts of their own driving. Congestion and noise costs are "external" to the vehicle owners whose decisions about how much, where, and when to drive more—or less—in response to changes in fuel economy result in these costs. Therefore, unlike changes in the costs incurred by drivers for fuel consumption or safety risks they willingly assume, changes in congestion and noise costs are not offset by corresponding changes in the travel benefits drivers experience.

Congestion costs are limited to road users; however, since road users include a significant fraction of the U.S. population, changes in congestion costs are treated as part of the rule's economic impact on the broader society instead of as a cost or benefit to private parties. Costs resulting from road and highway noise are even more widely dispersed, because they are borne partly by surrounding residents, pedestrians, and other non-road users, and for this reason are also considered as a cost to the society as a whole.

To estimate the economic costs associated with changes in congestion and noise caused by differences in miles driven, the agency updated the underlying components of the cost estimates of per-mile congestion and noise costs from increased automobile and light truck use provided in FHWA's 1997 Highway Cost Allocation Study. The agencies previously relied on this study in the 2010, 2011, and 2012 final rules, and updating the individual underlying components for congestion

<sup>346</sup> NASEM, 2021, p. 11–357.

costs in this analysis improves currency and internal consistency with the rest of the analysis. See TSD Chapter 6.2 for details on how the agency calculated estimate the economic costs associated with changes in congestion and noise caused by differences in miles driven. NHTSA specifically seeks comment on the congestion costs employed in this analysis, and whether and how to change them for the analysis for the final rule.

## (2) Fuel Tax Revenue

As mentioned in III.G.1.b)(1), a portion of the fuel savings experienced by consumers includes avoided fuel taxes. While fuel taxes are treated as a transfer within the analysis and do not affect net benefits, the agency provides an estimate here to show the potential impact to state and local governments.

## (b) Benefits

### (1) Reduced Climate Damages

Extracting and transporting crude petroleum, refining it to produce transportation fuels, and distributing fuel generate additional emissions of GHGs and criteria air pollutants beyond those from cars' and light trucks' use of fuel. By reducing the volume of petroleum-based fuel produced and consumed, adopting higher CAFE standards will thus mitigate global climate-related economic damages caused by accumulation of GHGs in the atmosphere, as well as the more immediate and localized health damages caused by exposure to criteria pollutants. Because they fall broadly on the U.S.—and global, in the case of climate damages—population, reducing them represents an external benefit from requiring higher fuel economy.

NHTSA estimates the global social benefits of CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O emission reductions expected from this proposed rule using the social cost of greenhouse gases (SC–GHG) estimates presented in the Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates under Executive Order 13990 (“February 2021 TSD”). These SC–GHG estimates are interim values developed under Executive Order (E.O.) 13990 for use in benefit-cost analyses until updated estimates of the impacts of climate change can be developed based on the best available science and economics. NHTSA uses the SC–GHG interim values to estimate the benefits of decreased fuel consumption stemming from the proposal.

The SC–GHG estimates used in our analysis were developed over many years, using transparent process, peer-

reviewed methodologies, the best science available at the time of that process, and with input from the public. Specifically, in 2009, an interagency working group (IWG) that included the DOT and other executive branch agencies and offices was established to ensure that agencies were using the best available science and to promote consistency in the social cost of carbon dioxide (SC–CO<sub>2</sub>) values used across agencies. The IWG published SC–CO<sub>2</sub> estimates in 2010. These estimates were updated in 2013 based on new versions of each IAM. In August 2016 the IWG published estimates of the social cost of methane (SC–CH<sub>4</sub>) and nitrous oxide (SC–N<sub>2</sub>O) using methodologies that are consistent with the methodology underlying the SC–CO<sub>2</sub> estimates. Executive Order 13990 (issued on January 20, 2021) re-established the IWG and directed it to publish interim SC–GHG values for CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O within thirty days. Furthermore, the E.O. tasked the IWG with devising long-term recommendations to update the methodologies used in calculating these SC–GHG values, based on “the best available economics and science,” and incorporating principles of “climate risk, environmental justice, and intergenerational equity”.<sup>347</sup> The E.O. also instructed the IWG to take into account the recommendations from the NAS committee convened on this topic, published in 2017.<sup>348</sup> The February 2021 TSD provides a complete discussion of the IWG’s initial review conducted under E.O. 13990.

NHTSA is using the IWG’s interim values, published in February 2021 in a technical support document, for the CAFE analysis in this NPRM.<sup>349</sup> This approach is the same as that taken in DOT regulatory analyses over 2009 through 2016. If the IWG issues new estimates before the final rule, the agency will consider revising the estimates within the CAFE Model time permitting. We request comment on this

approach to estimating social benefits of reducing GHG emissions in this rulemaking in light of the ongoing interagency process.

NHTSA notes that the primary analysis for this proposal estimates benefits from reducing emissions of CO<sub>2</sub> and other GHGs that incorporate a 2.5% discount rate for distant future climate damages, while discounting costs and non-climate related benefits using a 3% rate. NHTSA also presents cost and benefits estimates in the primary analysis that reflect a 3% discount rate for reductions in climate-related damages while discounting costs and non-climate related benefits at 7%. NHTSA believes this approach represents an appropriate treatment of the intergenerational issues presented by emissions that result in climate-related damages over a very-long time horizon, and is within scope of the IWG’s *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide* that recommends discounting future climate damages at rates of 2.5%, 3%, and 5%.<sup>350</sup>

In addition, NHTSA emphasize the importance and value of considering the benefits calculated using all four SC–GHG estimates for each of three greenhouse gases. NHTSA includes the social costs of CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O calculated using the four different estimates recommended in the February 2021 TSD (model average at 2.5 percent, 3 percent, and 5 percent discount rates; 95th percentile at 3 percent discount rate) in the PRIA.

The February 2021 TSD does not specify how agencies should combine its estimates of benefits from reducing GHG emissions that reflect these alternative discount rates with the discount rates for nearer-term benefits and costs prescribed in OMB Circular A–4. Instead, it provides agencies with broad flexibility in implementing the February 2021 TSD. However, the February 2021 TSD does identify 2.5% as the “average certainty-equivalent rate using the mean-reverting and random walk approaches from Newell and Pizer (2003) starting at a discount rate of 3 percent.”<sup>351</sup> As such, NHTSA believes using a 2.5% discount rate for climate-related damages is consistent with the IWG guidance.

This section provides further discussion of the discount rates that NHTSA uses in its regulatory analysis

<sup>350</sup> Interagency Working Group on Social Cost of Greenhouse Gases, United States Government, *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide, Interim Estimates under Executive Order 13990*, February 2021.

<sup>351</sup> *Ibid.*

and presents results of a sensitivity analysis using a 3% discount rate for reductions in climate-related damages. NHTSA welcomes public comment on its selection of 2.5% for climate-related damages and will consider other discount rates for the final rule.

For a full discussion of the agency's quantification of GHGs, see TSD Chapter 6.2.1 and the PRIA.

(a) Discount Rates Accounting for Intergenerational Impacts

A standard function of regulatory analysis is to evaluate tradeoffs between impacts that occur at different points in time. Many, if not most, Federal regulations involve costly upfront investments that generate future benefits in the form of reductions in health, safety, or environmental damages. To evaluate these tradeoffs, the analysis must account for the social rate of time preference—the broadly observed social preference for benefits that occur sooner versus those that occur further in the future.<sup>352</sup> This is accomplished by discounting impacts that occur further in the future more than impacts that occur sooner.

OMB Circular A-4 affirmed the appropriateness of accounting for the social rate of time preference in regulatory analyses and prescribed discount rates of 3% and 7% for doing so. The 3% discount rate was chosen to represent the “consumption rate of interest” approach, which discounts future costs and benefits to their present values using the rate at which consumers appear to make tradeoffs between current consumption and equal consumption opportunities deferred to the future. OMB Circular A-4 reports a real rate of return on 10-year Treasury notes of 3.1% between 1973 and its 2003 publication date and interprets this as approximating the rate at which society is indifferent between consumption today and in the future.

The 7% rate reflects the opportunity cost of capital approach to discounting, where the discount rate approximates the foregone return on private investment if the regulation were to divert resources from capital formation. OMB Circular A-4 cites pre-tax rates of return on capital as part of its selection of the 7% rate.<sup>353</sup> The IWG rejected the use of the opportunity cost of capital approach to discounting reductions in climate-related damages because

“consumption rate of interest is the correct discounting concept to use when future damages from elevated temperatures are estimated in consumption-equivalent units as is done in the IAMs used to estimate the SC-GHG (National Academies 2017).”<sup>354</sup>

As the IWG states, “GHG emissions are stock pollutants, where damages are associated with what has accumulated in the atmosphere over time, and they are long lived such that subsequent damages resulting from emissions today occur over many decades or centuries depending on the specific greenhouse gas under consideration.”<sup>355</sup> OMB Circular A-4 states that impacts occurring over such intergenerational time horizons require special treatment:

Special ethical considerations arise when comparing benefits and costs across generations. Although most people demonstrate time preference in their own consumption behavior, it may not be appropriate for society to demonstrate a similar preference when deciding between the well-being of current and future generations. Future citizens who are affected by such choices cannot take part in making them, and today's society must act with some consideration of their interest.<sup>356</sup>

In addition to the ethical considerations, Circular A-4 also identifies uncertainty in long-run interest rates as a potential justification for using lower rates to discount intergenerational impacts. As Circular A-4 states, “Private market rates provide a reliable reference for determining how society values time within a generation, but for extremely long time periods no comparable private rates exist.”<sup>357</sup> The social costs of distant future climate damages—and by implication, the value of reducing them by lowering emissions of GHGs—are highly sensitive to the discount rate, and the present value of reducing climate damages grows at an increasing rate as the discount rate used in the analysis declines. This “non-linearity” means that even if uncertainty about the exact value of the long-run interest rate is equally distributed between values above and below the 3% consumption rate of interest, the probability-weighted (or “expected”) present value of a unit reduction in climate damages will be higher than the value calculated using a 3% discount rate. The effect of such

uncertainty about the correct discount rate can thus be accounted for by using a lower “certainty-equivalent” rate to discount distant future damages.

The IWG identifies “a plausible range of certainty-equivalent constant consumption discount rates: 2.5, 3, and 5 percent per year.” The IWG's justification for its selection of these rates is summarized in this excerpt from its 2021 guidance:

The 3 percent value was included as consistent with estimates provided in OMB's Circular A-4 (OMB 2003) guidance for the consumption rate of interest. . . . The upper value of 5 percent was included to represent the possibility that climate-related damages are positively correlated with market returns, which would imply a certainty equivalent value higher than the consumption rate of interest. The low value, 2.5 percent, was included to incorporate the concern that interest rates are highly uncertain over time. It represents the average certainty-equivalent rate using the mean-reverting and random walk approaches from Newell and Pizer (2003) starting at a discount rate of 3 percent. Using this approach, the certainty equivalent is about 2.2 percent using the random walk model and 2.8 percent using the mean reverting approach. Without giving preference to a particular model, the average of the two rates is 2.5 percent. Additionally, a rate below the consumption rate of interest would also be justified if the return to investments in climate mitigation are negatively correlated with the overall market rate of return. Use of this lower value was also deemed responsive to certain judgments based on the prescriptive or normative approach for selecting a discount rate and to related ethical objections that have been raised about rates of 3 percent or higher.

Because the certainty-equivalent discount rate will lie progressively farther below the best estimate of the current rate as the time horizon when future impacts occur is extended, the IWG's recent guidance also suggest that it may be appropriate to use a discount rate that declines over time to account for interest rate uncertainty, as has been recommended by the National Academies and EPA's Science Advisory Board.<sup>358</sup> The IWG mentioned that it will consider these recommendations and the relevant academic literature on declining rates in developing its final

<sup>352</sup> This preference is observed in many market transactions, including by savers that expect a return on their investments in stocks, bonds, and other equities; firms that expect positive rates of return on major capital investments; and banks that demand positive interest rates in lending markets.

<sup>353</sup> OMB Circular A-4.

guidance on the social cost of greenhouse gases.

The IWG 2021 interim guidance also presented new evidence on the consumption-based discount rate suggesting that a rate lower than 3% may be appropriate. For example, the IWG replicated OMB Circular A–4’s original 2003 methodology for estimating the consumption rate using the average return on 10-year Treasury notes over the last 30 years and found a discount rate close to 2%. They also presented rates over a longer time horizon, finding an average rate of 2.3% from 1962 to the present. Finally, they summarized results from surveys of experts on the topic and found a “surprising degree of consensus” for using a 2% consumption rate of interest to discount future climate-related impacts.<sup>359</sup>

NHTSA expects that the Interagency Working Group will continue to develop its final guidance on the appropriate discount rates to use for reductions in climate damages as NHTSA develops its final rule. If new guidance is issued in time for NHTSA’s final rule, NHTSA will incorporate the IWG’s updated guidance in the final regulatory analysis.

(b) Discount Rates Used in This Proposal for Climate-Related Benefits

As indicated above, NHTSA’s primary analysis presents cost and benefit estimates using a 2.5% discount rate for reductions in climate-related damages and 3% for non-climate related impacts. NHTSA also presents cost and benefits estimates using a 3% discount rate for reductions in climate-related damages alongside estimates of non-climate related impacts discounted at 7%. This latter pairing of a 3% rate for discounting benefits from reducing climate-related damages with a 7% discount rate for non-climate related impacts is consistent with NHTSA’s past practice.<sup>360</sup> However, NHTSA’s pairing of 2.5% for climate-related damage reductions with 3% for non-climate related impacts is novel in this proposal.

As discussed above, the IWG’s guidance indicates that uncertainty in long-run interest rates suggests that a lower “certainty-equivalent” discount rate is appropriate for intergenerational impacts, and identifies 2.5%, 3%, and 5% as “certainty-equivalent” discount rates. NHTSA emphasizes the importance and value of considering the

benefits calculated using all four SC–GHG estimates for each of three greenhouse gases. NHTSA includes the social costs of CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O calculated using the four different estimates recommended in the February 2021 TSD (model average at 2.5 percent, 3 percent, and 5 percent discount rates; 95th percentile at 3 percent discount rate) in the PRIA. For presentation purposes in this rule, NHTSA shows two primary estimates. NHTSA believes that pairing OMB’s 3% estimate of the consumption discount rate for near-term costs and benefits with the IWG’s lower certainty-equivalent rate of 2.5% is consistent with current interim guidance in the February 2021 TSD. NHTSA also believe that its pairing of the 3% certainty-equivalent rate for climate-related benefits with OMB’s 7% discount rate is consistent with guidance from the February 2021 TSD for GHGs and OMB Circular A–4 for other costs and benefits.

In addition, NHTSA presents a sensitivity analysis where both distant future and nearer-term GHG impacts are discounted using the 3% rate combined with all other costs and benefits discounted at 3%.

**Table III-39 – Comparison of Results Using a 3% Discount Rate for All Impacts Except GHGs with Impacts Using Either 2.5% or 3% for Climate-Related Benefits, Model Years 1981 through 2029**

	Totals	
	3%/2.5% SC-GHG Discount Rate	3%/3% SC-GHG Discount Rate
Costs	121.1	121.1
Benefits	121.4	110.5
Net Benefits	0.3	-10.6

**Table III-40 – Comparison of Results Using a 3% Discount Rate for All Impacts Except GHGs with Impacts Using Either 2.5% or 3% for Climate-Related Benefits, Calendar Years 2021 through 2050**

	Totals	
	3%/2.5% SC-GHG Discount Rate	3%/3% SC-GHG Discount Rate
Costs	333.6	333.6
Benefits	433.6	391.7
Net Benefits	100	58.1

<sup>359</sup> *Ibid.*

NHTSA seeks comment on the above discussion.

## (2) Reduced Health Damages

The CAFE Model estimates monetized health effects associated with emissions from three criteria pollutants: NO<sub>x</sub>, SO<sub>x</sub>, and PM<sub>2.5</sub>. As discussed in Section III.F above, although other criteria pollutants are currently regulated, only impacts from these three pollutants are calculated since they are known to be emitted regularly from mobile sources, have the most adverse effects to human health, and there exist several papers from the EPA estimating the benefits per ton of reducing these pollutants. Other pollutants, especially those that are precursors to ozone, are more difficult to model due to the complexity of their formation in the atmosphere, and EPA does not calculate benefit-per-ton estimates for these. The CAFE Model computes the monetized impacts associated with health damages from each pollutant by multiplying monetized health impact per ton values by the total tons of these pollutants, which are emitted from both upstream and tailpipe sources. Chapter 5 of the TSD accompanying this proposal includes a detailed description of the emission factors that inform the CAFE Model's calculation of the total tons of each pollutant associated with upstream and tailpipe emissions.

These monetized health impacts per ton values are closely related to the health incidence per ton values described above in Section III.F and in detail in Chapter 5.4 of the TSD. We use the same EPA sources that provided health incidence values to determine which monetized health impacts per ton values to use as inputs in the CAFE Model. Like the estimates associated with health incidences per ton of criteria pollutant emissions, we used multiple EPA papers and conversations with EPA staff to appropriately account for monetized damages for each pollutant associated with the source sectors included in the CAFE Model, based on which papers contained the most up-to-date data.<sup>361</sup> The various emission source sectors included in the EPA papers do not always correspond exactly to the emission source categories

used in the CAFE Model.<sup>362</sup> In those cases, we mapped multiple EPA sectors to a single CAFE source category and computed a weighted average of the health impact per ton values.

The EPA uses the value of a statistical life (VSL) to estimate premature mortality impacts, and a combination of willingness to pay estimates and costs of treating the health impact for estimating the morbidity impacts.<sup>363</sup> EPA's 2018 technical support document, "Estimating the Benefit per Ton of Reducing PM<sub>2.5</sub> Precursors from 17 Sectors,"<sup>364</sup> (referred to here as the 2018 EPA source apportionment TSD) contains a more detailed account of how health incidences are monetized. It is important to note that the EPA sources cited frequently refer to these monetized health impacts per ton as "benefits per ton," since they describe these estimates in terms of emissions avoided. In the CAFE Model input structure, these are generally referred to as monetized health impacts or damage costs associated with pollutants emitted, not avoided, unless the context states otherwise.

The CAFE Model health impacts inputs are based partially on the structure the 2018 EPA source apportionment TSD, which reported benefits per ton values for the years 2020, 2025, and 2030. For the years in between the source years used in the input structure, the CAFE Model applies values from the closest source year. For instance, the model applies 2020 monetized health impact per ton values for calendar years 2020–2022 and applies 2025 values for calendar years 2023–2027. For some of the monetized health damage values, in order to match the structure of other impacts costs, DOT staff developed proxies for 7% discounted values for specific source sectors by using the ratio between a comparable sector's 3% and 7% discounted values. In addition, we used implicit price deflators from the Bureau of Economic Analysis (BEA) to convert different monetized estimates to 2018 dollars, in order to be consistent with the rest of the CAFE Model inputs.

<sup>362</sup> The CAFE Model's emission source sectors follow a similar structure to the inputs from GREET. See Chapter 5.2 of the TSD accompanying this proposal for further information.

<sup>363</sup> Although EPA and DOT's VSL values differ, DOT staff determined that using EPA's VSL was appropriate here, since it was already included in these monetized health impact values, which were best suited for the purposes of the CAFE Model.

<sup>364</sup> See Environmental Protection Agency (EPA). 2018. Estimating the Benefit per Ton of Reducing PM<sub>2.5</sub> Precursors from 17 Sectors. [https://www.epa.gov/sites/production/files/2018-02/documents/sourceapportionmentbpttsd\\_2018.pdf](https://www.epa.gov/sites/production/files/2018-02/documents/sourceapportionmentbpttsd_2018.pdf).

<sup>361</sup> Environmental Protection Agency (EPA). 2018. Estimating the Benefit per Ton of Reducing PM<sub>2.5</sub> Precursors from 17 Sectors. [https://www.epa.gov/sites/production/files/2018-02/documents/sourceapportionmentbpttsd\\_2018.pdf](https://www.epa.gov/sites/production/files/2018-02/documents/sourceapportionmentbpttsd_2018.pdf); Wolfe et al. 2019. Monetized health benefits attributable to mobile source emissions reductions across the United States in 2025. <https://pubmed.ncbi.nlm.nih.gov/30296769/>; Fann et al. 2018. Assessing Human Health PM<sub>2.5</sub> and Ozone Impacts from U.S. Oil and Natural Gas Sector Emissions in 2025. <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6718951/>.

This process is described in more detail in Chapter 6.2.2 of the TSD accompanying this proposal. In addition, the CAFE Model documentation contains more details of the model's computation of monetized health impacts. All resulting emissions damage costs for criteria pollutants are located in the Criteria Emissions Cost worksheet of the Parameters file.

## (3) Reduction in Petroleum Market Externality

By amending existing standards, the proposal would decrease domestic consumption of gasoline, producing a correspondingly decrease in the Nation's demand for crude petroleum, a commodity that is traded actively in a worldwide market. Although the U.S. accounts for a sufficient (albeit diminishing) share of global oil consumption that the resulting decrease in global petroleum demand will exert some downward pressure on worldwide prices.

U.S. consumption and imports of petroleum products have three potential effects on the domestic economy that are often referred to collectively as "energy security externalities," and increases in their magnitude are sometimes cited as possible social costs of increased U.S. demand for petroleum. First, any increase in global petroleum prices that results from higher U.S. gasoline demand will cause a transfer of revenue to oil producers worldwide from consumers of petroleum, because consumers throughout the world are ultimately subject to the higher global price that results. Although this transfer is simply a shift of resources that produces no change in global economic welfare, the financial drain it produces on the U.S. economy is sometimes cited as an external cost of increased U.S. petroleum consumption because consumers of petroleum products are unlikely to consider it.

As the U.S. approaches self-sufficiency in petroleum production (the Nation became a net exporter of petroleum in 2020), this transfer is increasingly from U.S. consumers of refined petroleum products to U.S. petroleum producers, so it not only leaves welfare unaffected, but even ceases to be a financial burden on the U.S. economy. In fact, as the U.S. becomes a larger net petroleum exporter, any transfer from global consumers to petroleum producers would become a financial benefit to the U.S. economy. Nevertheless, uncertainty in the Nation's long-term import-export balance makes it difficult to project precisely how these effects might

change in response to increased consumption.

Higher U.S. petroleum consumption can also increase domestic consumers' exposure to oil price shocks and thus increase potential costs to all U.S. petroleum users (including those outside the light duty vehicle sector, whose consumption would be unaffected by this proposed rule) from possible interruptions in the global supply of petroleum or rapid increases in global oil prices. Because users of petroleum products are unlikely to consider the effect of their increased purchases on these risks, their economic value is often cited as an external cost of increased U.S. consumption.

Finally, some analysts argue that domestic demand for imported petroleum may also influence U.S. military spending; because the increased cost of military activities would not be reflected in the price paid at the gas pump, this is often suggested to represent a third category of external costs from increased U.S. petroleum consumption. For example, NHTSA has received extensive comments to past actions from the group Securing America's Energy Future on this topic.

Each of these three factors would be expected to decrease—albeit by a limited magnitude—as a consequence of decrease in U.S. petroleum consumption resulting from the proposed standards. TSD Chapter 6.2.4 provides a comprehensive explanation of the agency's analysis of these three impacts.

#### (4) Changes in Labor

As vehicle prices rise, we expect consumers to purchase fewer vehicles than they would have at lower prices. If manufacturers produce fewer vehicles as a consequence of lower demand, manufacturers may need less labor to produce their fleet and dealers may need less labor to sell the vehicles. Conversely, as manufacturers add equipment to each new vehicle, the industry will require labor resources to develop, sell, and produce additional fuel-saving technologies.<sup>365</sup> We also account for the possibility that new standards could shift the relative shares of passenger cars and light trucks in the overall fleet. Since the production of different vehicles involves different amounts of labor, this shift impacts the quantity of estimated labor.

The analysis considers the direct labor effects that the CAFE standards have across the automotive sector. The

facets include (1) dealership labor related to new light-duty vehicle unit sales; (2) assembly labor for vehicles, engines, and transmissions related to new vehicle unit sales; and (3) labor related to mandated additional fuel savings technologies, accounting for new vehicle unit sales. The labor utilization analysis is intentionally narrow in its focus and does not represent an attempt to quantify the overall labor or economic effects of this rulemaking because adjacent employment factors and consumer spending factors for other goods and services are uncertain and difficult to predict. We do not consider how direct labor changes may affect the macro economy and potentially change employment in adjacent industries. For instance, we do not consider possible labor changes in vehicle maintenance and repair, nor changes in labor at retail gas stations. We also do not consider possible labor changes due to raw material production, such as production of aluminum, steel, copper, and lithium, nor does the agency consider possible labor impacts due to changes in production of oil and gas, ethanol, and electricity.

All labor effects are estimated and reported at a national level, in person-years, assuming 2,000 hours of labor per person-year.<sup>366</sup> These labor hours are not converted into monetized values because we assume that the labor costs are included into a new vehicle's purchasing price. The analysis estimates labor effects from the forecasted CAFE Model technology costs and from review of automotive labor for the MY 2020 fleet. The agency uses information about the locations of vehicle assembly, engine assembly, and transmission assembly, and the percent of U.S. content of vehicles collected from American Automotive Labeling Act (AALA) submissions for each vehicle in the reference fleet.<sup>367</sup> The analysis assumes the portion of parts that are made in the U.S. will remain constant for each vehicle as manufacturers add fuel-savings technologies. This should not be misconstrued as a prediction that the percentage of U.S.-made parts—and by extension U.S. labor—will remain constant, but rather that the agency does not have a clear basis to project where future productions may shift. The analysis also uses data from the National Automotive Dealers

Association (NADA) annual report to derive dealership labor estimates.

In sum, the analysis shows that the increased labor from production of new technologies used to meet the preferred alternative will outweigh any decreases attributable to the change in new vehicle sales. For a full description of the process the agency uses to estimate labor impacts, see TSD Chapter 6.2.5.

#### 3. Costs and Benefits Not Quantified

In addition to the costs and benefits described above, Table III–37 and Table III–38 each include two line-items without values. The first is maintenance and repair costs. Many of the technologies manufacturers apply to vehicles to meet CAFE standards are sophisticated and costly. The technology costs capture only the initial or “upfront” costs to incorporate this equipment into new vehicles; however, if the equipment is costlier to maintain or repair—which is likely either because the materials used to produce the equipment are more expensive or the equipment is significantly more complex than less fuel efficient alternatives and requires more time and labor—then consumers will also experience increased costs throughout the lifetime of the vehicle to keep it operational. The agency does not calculate the additional cost of repair and maintenance currently because it lacks a basis for estimating the incremental change attributable to the standards. The agency seeks comment on methods for estimating these costs.

The second item is the potential sacrifice in other vehicle attributes. In addition to fuel economy, potential buyers of new cars and light trucks value other features such as their seating and cargo-carrying capacity, ride comfort, safety, and performance. Changing some of these other features, however, can affect vehicles' fuel economy, so manufacturers will carefully consider tradeoffs among them when deciding how to comply with stricter CAFE standards. Currently the analysis assumes that these vehicle attributes will not change as a result of these rules,<sup>368</sup> but in practice manufacturers may need to make practical design changes to meet the standards. Even if manufacturers are able to hold vehicles' other attributes at *today's* levels while meeting higher fuel economy targets, manufacturers may have to dedicate additional resources to comply with stricter CAFE targets and forego improvements in other vehicle attributes. The potential loss of other

<sup>365</sup> For the purposes of this analysis, DOT assumes a linear relationship between labor and production volumes.

<sup>366</sup> The agencies recognize a few local production facilities may contribute meaningfully to local economies, but the analysis reports only on national effects.

<sup>367</sup> 49 CFR part 583.

<sup>368</sup> See TSD Chapter 2.4.5.

vehicle attributes is an opportunity cost to consumers.

The agency has previously attempted to model the potential sacrifice in other vehicle attributes in sensitivity analyses. In those other rulemakings, the agency acknowledged that it is extremely difficult to quantify the potential loss of other vehicle attributes. To accurately do so requires extensive projections about which and how much of other attributes will be sacrificed and a detailed accounting of how much value consumers assigned to those attributes. The agency modeled the loss in other vehicle attributes using published empirical estimates of tradeoffs between higher fuel economy and improvements to other attributes, together with estimates of the values buyers attach to those attributes. The agency is unsure whether this is an appropriate methodology since there is uncertainty about how much fuel economy consumers are willing to pay for and how consumers value other vehicle attributes. The agency seeks comment on alternative methods for estimating the potential sacrifice in other vehicle attributes.

#### *H. Simulating Safety Effects of Regulatory Alternatives*

The primary objective of CAFE standards is to achieve maximum feasible fuel economy, thereby reducing fuel consumption. In setting standards to achieve this intended effect, the potential of the standards to affect vehicle safety is also considered. As a safety agency, the agency has long considered the potential for adverse safety consequences when establishing CAFE standards.

This safety analysis includes the comprehensive measure of safety impacts from three factors:

1. Changes in Vehicle Mass. Similar to previous analyses, the agency calculates the safety impact of changes in vehicle mass made to reduce fuel consumption and comply with the standards. Statistical analysis of historical crash data indicates reducing mass in heavier vehicles generally improves safety, while reducing mass in lighter vehicles generally reduces safety. The agency's crash simulation modeling of vehicle design concepts for reducing mass revealed similar effects. These observations align with the role of mass disparity in crashes; when vehicles of different masses collide, the smaller vehicle will experience a larger change in velocity (and, by extension, force) which increases the risk to its occupants.

2. Impacts of Vehicle Prices on Fleet Turnover. Vehicles have become safer

over time through a combination of new safety regulations and voluntary safety improvements. The agency expects this trend to continue as emerging technologies, such as advanced driver assistance systems, are incorporated into new vehicles. Safety improvements will likely continue regardless of changes to CAFE standards.

As discussed in Section III.E.2, technologies added to comply with fuel economy standards have an impact on vehicle prices, therefore slowing the acquisition of newer vehicles and retirement of older ones. The delay in fleet turnover caused by the effect of new vehicle prices affect safety by slowing the penetration of new safety technologies into the fleet.

The standards also influence the composition of the light-duty fleet. As the safety provided by light trucks, SUVs and passenger cars responds differently to technology that manufacturers employ to meet the standards—particularly mass reduction—fleets with different compositions of body styles will have varying numbers of fatalities, so changing the share of each type of light-duty vehicle in the projected future fleet impacts safety outcomes.

3. Increased driving because of better fuel economy. The “rebound effect” predicts consumers will drive more when the cost of driving declines. More stringent standards reduce vehicle operating costs, and in response, some consumers may choose to drive more. Additional driving increases exposure to risks associated with motor vehicle travel, and this added exposure translates into higher fatalities and injuries.

The contributions of the three factors described above generate the differences in safety outcomes among regulatory alternatives.<sup>369</sup> The agency's analysis makes extensive efforts to allocate the differences in safety outcomes between the three factors. Fatalities expected during future years under each alternative are projected by deriving a fleet-wide fatality rate (fatalities per vehicle mile of travel) that incorporates the effects of differences in each of the three factors from baseline conditions and multiplying it by that alternative's expected VMT. Fatalities are converted

<sup>369</sup> The terms safety performance and safety outcome are related but represent different concepts. When we use the term safety performance, we are discussing the intrinsic safety of a vehicle based on its design and features, while safety outcome is used to describe whether a vehicle has been involved in an accident and the severity of the accident. While safety performance influences safety outcomes, other factors such as environmental and behavioral characteristics also play a significant role.

into a societal cost by multiplying fatalities with the DOT-recommended value of a statistical life (VSL) supplemented by economic impacts that are external to VSL measurements. Traffic injuries and property damage are also modeled directly using the same process and valued using costs that are specific to each injury severity level.

All three factors influence predicted fatalities, but only two of them—changes in vehicle mass and in the composition of the light-duty fleet in response to changes in vehicle prices—impose increased risks on drivers and passengers that are not compensated for by accompanying benefits. In contrast, increased driving associated with the rebound effect is a consumer choice that reveals the benefit of additional travel. Consumers who choose to drive more have apparently concluded that the utility of additional driving exceeds the additional costs for doing so, including the crash risk that they perceive additional driving involves. As discussed in Chapter 7 of the accompanying Technical Support Document, the benefits of rebound driving are accounted for by offsetting a portion of the added safety costs.

The agency categorizes safety outcome through three measures of light-duty vehicle safety: Fatalities to occupants occurring in crashes, serious injuries sustained by occupants, and the number of vehicles involved in crashes that cause property damage but no injuries. Counts of fatalities to occupants of automobiles and light trucks are obtained from the agency's Fatal Accident Reporting System (FARS). Estimates of the number of serious injuries to drivers and passengers of light-duty vehicles are tabulated from the agency's General Estimates System (GES), an annual sampling of motor vehicle crashes occurring throughout the U.S. Weights for different types of crashes were used to expand the samples of each type to estimates of the total number of crashes occurring during each year. Finally, estimates of the number of automobiles and light trucks involved in property damage-only (PDO) crashes each year were also developed using GES. NHTSA seeks comment on the following discussion.

#### 1. Mass Reduction Impacts

Vehicle mass reduction can be one of the more cost-effective means of improving fuel economy, particularly for makes and models not already built with much high-strength steel or aluminum closures or low-mass components. Manufacturers have stated that they will continue to reduce vehicle

mass to meet more stringent standards, and therefore, this expectation is incorporated into the modeling analysis supporting the standards. Safety trade-offs associated with mass-reduction have occurred in the past, particularly before CAFE standards were attribute-based; past safety trade-offs may have occurred because manufacturers chose at the time, in response to CAFE standards, to build smaller and lighter vehicles. In cases where fuel economy improvements were achieved through reductions in vehicle size and mass, the smaller, lighter vehicles did not fare as well in crashes as larger, heavier vehicles, on average. Although The agency now uses attribute-based standards, in part to reduce or eliminate the incentive to downsize vehicles to comply with CAFE standards, the agency must be mindful of the possibility of related safety trade-offs.

For this proposed rule, the agency employed the modeling technique developed in the 2016 Puckett and Kindelberger report to analyze the updated crash and exposure data by examining the cross sections of the societal fatality rate per billion vehicle miles of travel (VMT) by mass and footprint, while controlling for driver age, gender, and other factors, in separate logistic regressions for five vehicle groups and nine crash types.<sup>370</sup> The agency utilized the relationships between weight and safety from this analysis, expressed as percentage increases in fatalities per 100-pound weight reduction (which is how mass reduction is applied in the technology analysis; see Section III.D.4), to examine the weight impacts applied in this CAFE analysis. The effects of mass reduction on safety were estimated relative to (incremental to) the regulatory baseline in the CAFE analysis, across all vehicles for MY 2021 and beyond.

In computing the impact of changes in mass on safety, the agency is faced with competing challenges. Research has consistently shown that mass reduction affects “lighter” and “heavier” vehicles differently across crash types. The 2016 Puckett and Kindelberger report found mass reduction concentrated among the heaviest vehicles is likely to have a beneficial effect on overall societal fatalities, while mass reduction concentrated among the lightest vehicles is likely to have a detrimental effect on fatalities. This represents a relationship between the dispersion of

mass across vehicles in the fleet and societal fatalities: Decreasing dispersion is associated with a decrease in fatalities. Mass reduction in heavier vehicles is more beneficial to the occupants of lighter vehicles than it is harmful to the occupants of the heavier vehicles. Mass reduction in lighter vehicles is more harmful to the occupants of lighter vehicles than it is beneficial to the occupants of the heavier vehicles.

To accurately capture the differing effect on lighter and heavier vehicles, the agency splits vehicles into lighter and heavier vehicle classifications in the analysis. However, this poses a challenge of creating statistically meaningful results. There is limited relevant crash data to use for the analysis. Each partition of the data reduces the number of observations per vehicle classification and crash type, and thus reduces the statistical robustness of the results. The methodology employed by the agency was designed to balance these competing forces as an optimal trade-off to accurately capture the impact of mass-reduction across vehicle curb weights and crash types while preserving the potential to identify robust estimates.

Comments on the NPRM (83 FR 42986, August 24, 2018) for the 2020 CAFE rule included suggestions that the sample of LTVs in the analysis should not include the medium- or heavy-duty (*i.e.*, truck-based vehicles with GVWR above 8,500 pounds) equivalents of light-duty vehicles in the sample (*e.g.*, Ford F-250 versus F-150, RAM 2500 versus RAM 1500, Chevrolet Suburban 2500 versus Chevrolet Suburban 1500), or Class 2b and 3 vehicles. For the proposal, NHTSA explored revising the analysis consistent with such comments. The process involved two key analytical steps: (1) Removing all case vehicles from the analysis whose GVWR exceeded 8,500 pounds; and (2) re-classifying all crash partners with GVWR above 8,500 pounds as heavy vehicles. The direct effects of these changes are: (1) The range of curb weights in the LTV sample is reduced, lowering the median curb weight from 5,014 pounds to 4,808 pounds; (2) the sample size of LTVs is reduced (the number of case LTVs under this alternative specification is approximately 18 percent lower than in the central analysis); and (3) the relative impact of crashes with LTVs on overall impacts on societal fatality rates decreases, while the corresponding impact of crashes with heavy vehicles increases.

The results from the exploratory analysis of this alternative approach are provided in Table III-41. The agency seeks comment on this alternative approach; public comment will inform the decision whether to incorporate the results into the CAFE Model. The primary functional change offered by the alternative approach is that the sample of vehicles classified as LTVs would be restricted to vehicles that would be subject to CAFE regulations. At the statistical level, the concerns raised in the agency’s response to comment on the 2018 CAFE NPRM remain. In particular, including Class 2b and 3 vehicles in the analysis to determine the relationship of vehicle mass on safety has the added benefit of improving correlation constraints. Notably, curb weight increases faster than footprint for large light trucks and Class 2b and 3 pickup trucks and SUVs, in part because the widths of vehicles are constrained more tightly (*i.e.*, due to lane widths) than their curb weights. Including data from Class 2b and 3 pickup truck and SUV fatal crashes provides data over a wider range of vehicle weights, which improves the ability to estimate the mass-crash fatality relationship. That is, by extending the footprint-curb weight-fatality data to include Class 2b and 3 trucks that are functionally and structurally similar to corresponding ½-ton models that are subject to CAFE regulation, the sample size and ranges of curb weights and footprint are improved. Sample size is a challenge for estimating relationships between curb weight and fatality risk for individual crash types in the main analysis; dividing the sample further or removing observations makes it increasingly difficult to identify meaningful estimates and the relationships that are present in the data, as shown in the sensitivity analysis below. For the proposal, the agency has determined that the benefit of the additional data points outweighs the concern that some of the vehicles used to determine the mass-safety coefficients are not regulated by CAFE vehicles.

The agency also explored three other alternative model specifications that are presented in Table III-41. The first alternative centers on aligning CUVs and minivans with the rest of the sample, by splitting these vehicles into two weight classes. The key factor restricting this change historically has been a low sample size for these vehicles; the exploratory analysis examined whether the current database (which, due to the range of CYs covered, contains a smaller share of CUVs and

<sup>370</sup>Puckett, S.M. and Kindelberger, J.C. (2016, June). Relationships between Fatality Risk, Mass, and Footprint in Model Year 2003–2010 Passenger Cars and LTVs—Preliminary Report. (Docket No. 2016–0068). Washington, DC: National Highway Traffic Safety Administration.

minivans than the current fleet) contains a sufficient sample size to evaluate two weight classes for CUVs and minivans. A complicating factor in this analysis is that minivans tend to have higher curb weights than other CUVs, adding statistical burden in identifying meaningful effects of mass on societal fatality rates after accounting for body type in the weight class with the fewest minivans (*i.e.*, lighter CUVs and minivans).

The second alternative centers on aligning passenger cars with the rest of the sample by including cars that are equipped with all-wheel drive (AWD). In previous analyses, passenger cars with AWD were excluded from the analysis because they represented a sufficiently low share of the vehicle fleet that statistical relationships between AWD status and societal

fatality risk were highly prone to being conflated with other factors associated with AWD status (*e.g.*, location, luxury vehicle status). However, the share of AWD passenger cars in the fleet has grown. Approximately one-quarter of the passenger cars in the database have AWD, compared to an approximately five-percent share in the MY 2000–2007 database. Furthermore, all other vehicle types in the analysis include AWD as an explanatory variable. Thus, the agency finds the inclusion of a considerable portion of the real-world fleet (*i.e.*, passenger cars with AWD) to be a meaningful consideration.

The third alternative is a minor procedural question: Whether to expand the CYs and MYs used to identify the distribution of fatalities across crash types. The timing of the safety databases places the years of the analysis used to

establish the distribution of fatalities by crash type firmly within the central years of the economic downturn of the late 2000s and early 2010s. During these years, travel demand was below long-term trends, resulting in fewer crashes. In turn, applying the same window of CYs and MYs to the identification of the distribution of fatalities across crash types results in notably fewer crashes to incorporate into the analysis. The agency conducted exploratory analysis on the question of whether to add CYs and MYs to the range of crashes used to identify the distribution of fatalities across crash types; this analysis was conducted in concert with the two alternatives discussed directly above. Results incorporating these three alternatives are presented in Table III–41.

**Table III-41 – Fatality Increase (%) per 100-Pound Mass Reduction While Holding Footprint Constant with Alternative Model Specifications - MY 2004-2011, CY 2006-2012**

Vehicle Class	Point Estimates, Fatalities Weighted Across MY 2008-2011 in CY 2008-2012 (Original Weights)	Point Estimates, Fatalities Weighted Across MY 2007-2011 in CY 2007-2012	Point Estimates, Fatalities Weighted Across MY 2006-2011 in CY 2006-2012	Point Estimates, Fatalities Weighted Across MY 2004-2011 in CY 2006-2012 (Full Sample)
Cars < 3,201 Pounds (including AWD)	1.12%	1.12%	1.11%	1.12%
Cars 3,201+ Pounds (including AWD)	0.89%	0.87%	0.84%	0.86%
LTVs < 4,808 Pounds (No Class 2b/3)	0.26%	0.26%	0.26%	0.29%
LTVs 4,808+ Pounds (No Class 2b/3)	-0.16%	-0.17%	-0.16%	-0.17%
CUVs and Minivans < 3,955 Pounds	0.20%	0.19%	0.18%	0.18%
CUVs and Minivans 3,955+ Pounds	-0.52%	-0.52%	-0.53%	-0.51%

Under the alternative specification excluding Class 2b and Class 3 truck-based vehicles as case vehicles, the median curb weight for LTVs is 4,808 pounds, or 206 pounds lighter than in the central analysis. When splitting CUVs and minivans into two weight classes, the median curb weight for the vehicles is 3,955 pounds. Under this alternative specification, where Class 2b and Class 3 truck-based crash partners are shifted from truck-based LTVs to heavy-duty vehicles, the median curb weight for LTV crash partners is 4,216

pounds, or 144 pounds lighter than in the central analysis.

Re-classifying Class 2b and Class 3 truck-based vehicles has a strong effect on the point estimate for heavier LTVs. Critically, removing the heaviest trucks as case vehicles yields a much smaller point estimate (reduction in societal fatality rates of between 0.16% and 0.17% per 100-pound mass reduction, versus 0.61% in the central analysis). This result is consistent with a relationship where a key share of the sensitivity of fatality risk is attributed to the mass of the heaviest vehicles in the

fleet (*i.e.*, supporting the role of mass dispersion in societal fatality rates). Importantly, the point estimate for lighter LTVs is not meaningfully different from the corresponding estimate in the central analysis (increase in societal fatality rates of between 0.26% and 0.29% per 100-pound mass reduction, versus 0.3% in the central analysis). Considered in concert, these results indicate that the most effective reductions in societal fatality rates via mass reduction in truck-based vehicles would arise not from lightweighting the heaviest vehicles subject to CAFE

regulation, but rather from lightweighting similar, medium- and heavy-duty vehicles.

Including passenger cars with AWD in the analysis has little effect on the point estimate for lighter passenger cars (increase in societal fatality rates of approximately 1.1% per 100-pound mass reduction, versus 1.2% in the central analysis). However, this revision has a strong effect on the point estimate for heavier passenger cars (increase in societal fatality rates of between 0.84% and 0.89% per 100-pound mass reduction, versus 0.42% in the central analysis). This result supports a hypothesis that, after taking AWD status into account, mass reduction in heavier passenger cars is a more important driver of societal fatality rates than previously estimated. Although this result could be spurious, estimated confidence bounds (presented below) indicate that accounting for AWD status reduces uncertainty in the point estimate. The agency seeks comment on the inclusion of passenger cars with AWD when estimating the effects of mass reduction on societal fatality rates.

Splitting CUVs and minivans into two vehicle classes yields point estimates that are consistent with the point estimate for the consolidated CUV-minivan vehicle class (an average decrease in societal fatality rates of approximately 0.16% to 0.18% per 100-pound mass reduction across the two vehicle classes, versus a decrease of 0.25% in the central analysis). However, sample sizes half as large in the two vehicle classes relative to the consolidated vehicle class lead to very large estimated confidence bounds, as shown below. Due to this uncertainty, the agency does not feel that the current databases contain a large enough sample of CUVs and minivans to split these vehicles into two classes in the analysis; however, this issue will be re-examined when the next iteration of the databases is complete.

Extending the range of CYs and MYs used to establish the distribution of fatalities across crash types has a negligible effect on the point estimates. Based on the narrow ranges of results in Table III–41, the agency finds evidence supporting a flexible approach in the choice of CYs and MYs used in this manner. All else being equal, extending the range helps to mitigate the potential for individual crash types with large estimated effects to drive spurious effects on overall estimates through unrepresentatively high estimated shares of overall fatalities. As a hedge in this direction, the agency applied the estimates from the alternative specification with two additional CYs

and MYs (*i.e.*, the second column from the right in Table III–41) when evaluating 95-percent confidence bounds for the alternative models considered here. The agency seeks comment on this approach to representing the distribution of fatalities across crash types.

A more detailed description of the mass-safety analysis can be found in Chapter 7 of the accompanying TSD.

## 2. Sales/Scrapage Impacts

The sales and scrapage responses to higher vehicle prices discussed in Section III.E.2 have important safety consequences and influence safety through the same basic mechanism, fleet turnover. In the case of the scrapage response, delaying fleet turnover keeps drivers in older vehicles which tend to be less safe than newer vehicles.<sup>371</sup> Similarly, the sales response slows the rate at which newer vehicles, and their associated safety improvements, enter the on-road population. The sales response also influences the mix of vehicles on the road—with more stringent CAFE standards leading to a higher share of light trucks sold in the new vehicle market, assuming all else is equal. This occurs because there is diminishing value to marginal improvements in fuel economy (there are fewer gallons to be saved), and as the difference in consumption between light trucks and passenger cars diminishes, the other attributes of the trucks will likely lead to increases in their market share—especially under lower gas prices. Light trucks have higher rates of fatal crashes when interacting with passenger cars and, as earlier discussed, different directional responses to mass reduction technology based on the existing mass and body style of the vehicle.

Any effects on fleet turnover (either from delayed vehicle retirement or deferred sales of new vehicles) will affect the distribution of both ages and model years present in the on-road fleet. Because each of these vintages carries with it inherent rates of fatal crashes, and newer vintages are generally safer than older ones, changing that distribution will change the total number of on-road fatalities under each regulatory alternative. Similarly, the dynamic fleet share model captures the

changes in the fleet's composition of cars and trucks. As cars and trucks have different fatality rates, differences in fleet composition across the alternatives will affect fatalities.

At the highest level, the agency calculates the impact of the sales and scrapage effects by multiplying the VMT of a vehicle by the fatality risk of that vehicle. For this analysis, calculating VMT is rather simple: The agency uses the distribution of miles calculated in TSD Chapter 4.3. The trickier aspect of the analysis is creating fatality rate coefficients. The fatality risk measures the likelihood that a vehicle will be involved in a fatal accident per mile driven. The agency calculates the fatality risk of a vehicle based on the vehicle's model year, age, and style, while controlling for factors which are independent of the intrinsic nature of the vehicle, such as behavioral characteristics. Using this same approach, the agency designed separate models for fatalities, non-fatal injuries, and property damaged vehicles.

The fatality risk projections described above capture the historical evolution of safety. Given that modern technologies are proliferating faster than ever and offer greater safety benefits than traditional safety improvements, the agency augmented the fatality risk projections with knowledge about forthcoming safety improvements. The agency applied detailed empirical estimates of the market uptake and improving effectiveness of crash avoidance technologies to estimate their effect on the fleet-wide fatality rate, including explicitly incorporating both the direct effect of those technologies on the crash involvement rates of new vehicles equipped with them, as well as the “spillover” effect of those technologies on improving the safety of occupants of vehicles that are not equipped with these technologies.<sup>372</sup>

The agency's approach to measuring these impacts is to derive effectiveness rates for these advanced crash-avoidance technologies from safety technology literature. The agency then applies these effectiveness rates to specific crash target populations for

<sup>371</sup> See Passenger Vehicle Occupant Injury Severity by Vehicle Age and Model Year in Fatal Crashes, Traffic Safety Facts Research Note, DOT–HS–812–528, National Highway Traffic Safety Administration, April, 2018, and The Relationship Between Passenger Vehicle Occupant Injury Outcomes and Vehicle Age or Model Year in Police-Reported Crashes, Traffic Safety Facts Research Note, DOT–HS–812–937, National Highway Traffic Safety Administration, March, 2020.

<sup>372</sup> These technologies included Forward Collision Warning (FCW), Crash Imminent Braking (CIB), Dynamic Brake Support (DBS), Pedestrian AEB (PAEB), Rear Automatic Braking, Semi-automatic Headlamp Beam Switching, Lane Departure Warning (LDW), Lane Keep Assist (LKA), and Blind Spot Detection (BSD). While Autonomous vehicles offer the possibility of significantly reducing or eventually even eliminating the effect of human error in crash causation, a contributing factor in roughly 94% of all crashes, there is insufficient information and certainty regarding autonomous vehicles eventual impact to include them in this analysis.

which the crash avoidance technology is designed to mitigate and adjusted to reflect the current pace of adoption of the technology, including the public commitment by manufacturers to install these technologies. The products of these factors, combined across all 6 advanced technologies, produce a fatality rate reduction percentage that is applied to the fatality rate trend model discussed above, which projects both vehicle and non-vehicle safety trends. The combined model produces a projection of impacts of changes in vehicle safety technology as well as behavioral and infrastructural trends. A much more detailed discussion of the methods and inputs used to make these projections of safety impacts from advanced technologies is included in Chapter 7 of the accompanying TSD.

### 3. Rebound Effect Impacts

The additional VMT demanded due to the rebound effect is accompanied by more exposure to risk, however, rebound miles are not imposed on consumers by regulation. They are a freely chosen activity resulting from reduced vehicle operational costs. As such, the agencies believe a large portion of the safety risks associated with additional driving are offset by the benefits drivers gain from added driving. The level of risk internalized by drivers is uncertain. This analysis assumes that consumers internalize 90 percent of this risk, which mostly offsets the societal impact of any added fatalities from this voluntary consumer

choice. Additional discussion of internalized risk is contained in TSD Chapter 7.4.

### 4. Value of Safety Impacts

Fatalities, nonfatal injuries, and property damage crashes are valued as a societal cost within the CAFE Model's cost and benefit accounting. Their value is based on the comprehensive value of a fatality, which includes lost quality of life and is quantified in the value of a statistical life (VSL) as well as economic consequences such as medical and emergency care, insurance administrative costs, legal costs, and other economic impacts not captured in the VSL alone. These values were derived from data in Blincoe et al. (2015), adjusted to 2018 dollars, and updated to reflect the official DOT guidance on the value of a statistical life. Nonfatal injury costs, which differ by severity, were weighted according to the relative incidence of injuries across the Abbreviated Injury Scale (AIS). To determine this incidence, the agency applied a KABCO<sup>373</sup>/maximum abbreviated injury scale (MAIS) translator to GES KABCO based injury counts from 2010 through 2015. This produced the MAIS based injury profile. This profile was used to weight nonfatal

<sup>373</sup>The "KABCO" injury scale also can be used for establishing crash costs. This scale was developed by the National Safety Council (NSC) and is frequently used by law enforcement for classifying injuries: K—Fatal; A—Incapacitating injury; B—Non-incapacitating injury; C—Possible injury; and O—No injury.

injury unit costs derived from Blincoe et al., adjusted to 2018 economics and updated to reflect the official DOT guidance on the value of a statistical life. Property-damaged vehicle costs were also taken from Blincoe et al. and adjusted to 2018 economics. VSL does not affect property damage. This gives societal values of \$10.8 million for each fatality, \$132,000 for each nonfatal injury, and \$7,100 for each property damaged vehicle.

### 5. Impacts of the Proposal on Safety

Table III–42 through Table III–44 summarize the safety impacts of the proposed standards on safety broken down by factor. These impacts are summarized over the lifetimes of model year 1981 through 2029 vehicles for all light passenger vehicles (including passenger cars and light trucks). Economic impacts are shown separately under both 3% and 7% discount rates. Model years 1981 through 2029 were examined because they represent the model years that might be affected by shifts in fleet composition due to the impact of higher new vehicle prices on sales of new vehicles and retention of older vehicles. Earlier years will be affected by slower scrappage rates and we expect the impacts of these standards will be fully realized in vehicle designs by MY 2029.

**BILLING CODE 4910-59-C**

As seen in the tables, all three safety factors—changes in mass, fleet turnover, and rebound—increase as the standards become more stringent. As expected, rebound fatalities grow at a constant rate as vehicles become more fuel efficient and are used more frequently. Mass reduction has a relatively minimal impact on safety and diminishes as stringency increases. This may point to either the fleet becoming more homogeneous and hence less mass disparate in crashes. Alternatively, the model may be capturing that there’s little room for more mass reductions in particular models. The slowing of fleet turnover due to higher vehicle prices has the largest impact of the three factors and accelerates with higher alternatives. Of course, if the agency’s assumptions overstate the rebound effect and/or slower fleet turnover, fatalities, injuries and property damage would be lower, and vice versa.

PRIA Chapter 5.5 discusses the results of the analysis in more detail and PRIA Chapter 5.6—Safety Impacts provides an overview of sensitivity analyses performed to isolate the uncertainty parameters of each of the three safety impacts.

**IV. Regulatory Alternatives Considered in this NPRM**

*A. Basis for Alternatives Considered*

Agencies typically consider regulatory alternatives in proposals as a way of evaluating the comparative effects of

different potential ways of accomplishing their desired goal. NEPA requires agencies to compare the potential environmental impacts of their proposed actions to those of a reasonable range of alternatives. Executive Orders 12866 and 13563, as well as OMB Circular A-4, also encourage agencies to evaluate regulatory alternatives in their rulemaking analyses.

Alternatives analysis begins with a “no-action” alternative, typically described as what would occur in the absence of any regulatory action. This proposal includes a no-action alternative, described below, and three “action alternatives.” The proposed standards may, in places, be referred to as the “preferred alternative,” which is NEPA parlance, but NHTSA intends “proposal” and “preferred alternative” to be used interchangeably for purposes of this rulemaking.

Regulations regarding implementation of NEPA require agencies to “rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated.” This does not amount to a requirement that agencies evaluate the widest conceivable spectrum of alternatives. Rather, the range of alternatives must be reasonable and consistent with the purpose and need of the action.

The different regulatory alternatives are defined in terms of percent-increases in CAFE stringency from year to year. Readers should recognize that those year-over-year changes in stringency are not measured in terms of mile per gallon differences (as in, 1 percent more stringent than 30 miles per gallon in one year equals 30.3 miles per gallon in the following year), but rather in terms of shifts in the footprint functions that form the basis for the actual CAFE standards (as in, on a gallon per mile basis, the CAFE standards change by a given percentage from one model year to the next). Under some alternatives, the rate of change is the same from year to year, while under others, it differs, and under some alternatives, the rate of change is different for cars and for trucks. One action alternative is more stringent than the proposal, while one is less stringent than the proposal. The alternatives considered in this proposal represent a reasonable range of possible final agency actions.

*B. Regulatory Alternatives and Proposed CAFE Standards for MYs 2024–2026*

The regulatory alternatives for this proposal are presented here as the percent-increases-per-year that they represent. The sections that follow will present the alternatives as the literal coefficients which define standards curves increasing at the given percentage rates and will also further explain the basis for the alternatives selected.

**Table IV-1 – Regulatory Alternatives Considered in this Proposal**

Regulatory Alternative	Year-Over-Year Stringency Increases (Passenger Cars)			Year-Over-Year Stringency Increases (Light Trucks)		
	2024	2025	2026	2024	2025	2026
Alternative 0 (No Action)	1.5%	1.5%	1.5%	1.5%	1.5%	1.5%
Alternative 1	9.14%	3.26%	3.26%	11.02%	3.26%	3.26%
Alternative 2 (Preferred)	8%	8%	8%	8%	8%	8%
Alternative 3	10%	10%	10%	10%	10%	10%

As for past rulemaking analyses, NHTSA has analyzed each of the regulatory alternatives in a manner that estimates manufacturers' potential application of technology in response to the corresponding CAFE requirements and the estimated market demand for fuel economy, considering estimated fuel prices, estimated product development cadence, and the estimated availability, applicability, cost, and effectiveness of fuel-saving technologies. The analysis sometimes shows that specific manufacturers could increase CAFE levels beyond requirements in ways estimated to "pay buyers back" very quickly (*i.e.*, within 30 months) for the corresponding additional costs to purchase new vehicles through avoided fuel outlays. Consistent with the analysis published with the 2020 final rule, this analysis shows that if battery costs decline as projected while fuel prices increase as projected, BEVs should become increasingly attractive on this basis, such that the modeled application of

BEVs (and some other technologies) clearly outstrips regulatory requirements after the mid-2030s.

The analysis accompanying the 2020 final rule presented such results for CAFE standards as well as—separately—CO<sub>2</sub> standards. New in this proposal, DOT has modified the CAFE Model to account for the *combined* effect of both CAFE and CO<sub>2</sub> standards, simulating technology application decisions each manufacturer could possibly make when faced with both CAFE standards and CO<sub>2</sub> standards (and also estimated market demand for fuel economy). This capacity was exercised for purposes of creating the baseline against which alternatives were analyzed, but not for purposes of modeling compliance with both agencies' proposals. Also, new for this proposal, DOT has further modified the CAFE Model to account for the "Framework" agreements California has reached with BMW, Ford, Honda, Volkswagen, and Volvo, and for the ZEV mandate that California and the "Section 177" states have adopted. The

TSD elaborates on these new model capabilities. Generally speaking, the model treats each manufacturer as applying the following logic when making technology decisions:

1. What do I need to carry over from last year?
2. What should I apply more widely in order to continue sharing (of, *e.g.*, engines) across different vehicle models?
3. What new PHEVs or BEVs do I need to build in order to satisfy the ZEV mandates?
4. What further technology, if any, could I apply that would enable buyers to recoup additional costs within 30 months after buying new vehicles?
5. What additional technology, if any, should I apply in order to respond to CAFE and CO<sub>2</sub> standards?

All of the regulatory alternatives considered here include, for passenger cars, the following coefficients defining the combination of baseline Federal CO<sub>2</sub> standards and the California Framework agreement.

**Table IV-2 – Passenger Car CO<sub>2</sub> Target Function Coefficients**

	2022	2023	2024	2025	2026
<i>a</i> (g/mi)	159	156	154	151	149
<i>b</i> (g/mi)	217	214	210	207	203
<i>c</i> (g/mi per s.f.)	3.88	3.82	3.77	3.71	3.65
<i>d</i> (g/mi)	-0.1	-0.4	-0.6	-0.9	-1.2
<i>e</i> (s.f.)	41	41	41	41	41
<i>f</i> (s.f.)	56	56	56	56	56
<i>g</i> (g/mi)	151	146	140	135	130
<i>h</i> (g/mi)	207	199	192	185	178
<i>i</i> (g/mi per s.f.)	3.70	3.56	3.43	3.30	3.18
<i>j</i> (g/mi)	-0.4	-0.4	-0.4	-0.3	-0.3

Coefficients *a*, *b*, *c*, *d*, *e*, and *f* define the current Federal CO<sub>2</sub> standards for passenger cars. Analogous to

coefficients defining CAFE standards, coefficients *a* and *b* specify minimum and maximum passenger car CO<sub>2</sub> targets

in each model year. Coefficients *c* and *d* specify the slope and intercept of the linear portion of the CO<sub>2</sub> target function,

and coefficients *e* and *f* bound the region within which CO<sub>2</sub> targets are defined by this linear form. Coefficients *g*, *h*, *i*, and *j* define the CO<sub>2</sub> targets applicable to BMW, Ford, Honda,

Volkswagen, and Volvo, pursuant to the agreement these manufacturers have reached with California. Beyond 2026, the MY 2026 Federal standards apply to all manufacturers, including these five

manufacturers. The coefficients shown in Table IV–3 define the corresponding CO<sub>2</sub> standards for light trucks.

**Table IV-3 – Light Truck CO<sub>2</sub> Target Function Coefficients**

	2022	2023	2024	2025	2026
<i>a</i> (g/mi)	203	200	196	193	190
<i>b</i> (g/mi)	324	319	314	309	304
<i>c</i> (g/mi per s.f.)	4.44	4.37	4.31	4.23	4.17
<i>d</i> (g/mi)	20.6	20.2	19.6	19.6	19.0
<i>e</i> (s.f.)	41	41	41	41	41
<i>f</i> (s.f.)	74	74	74	74	74
<i>g</i> (g/mi)	188	181	175	168	162
<i>h</i> (g/mi)	322	310	299	288	277
<i>i</i> (g/mi per s.f.)	4.12	3.97	3.82	3.68	3.54
<i>j</i> (g/mi)	19.1	18.4	17.7	17.0	16.4

All of the regulatory alternatives considered here also include NHTSA’s estimates of ways each manufacturer could introduce new PHEVs and BEVs in response to ZEV mandates. As discussed in greater detail below, these

estimates force the model to convert specific vehicle model/configurations to either a BEV200, BEV300, or BEV400 at the earliest estimated redesign. These “ZEV Candidates” define an *incremental* response to ZEV mandates

(*i.e.*, beyond PHEV and BEV production through MY 2020) comprise the following shares of manufacturers’ MY 2020 production for the U.S. market as shown in Table IV–4.

**Table IV-4 – ZEV “Candidates” as Share of MY 2020 Production**

Manufacturer	BEV200	BEV300	BEV400
BMW		1.9%	
Daimler	2.6%		0.8%
FCA		1.1%	
Ford	0.1%	1.1%	
GM		1.0%	
Honda		1.8%	
Hyundai		1.3%	
Kia	1.7%	0.5%	
Jaguar – Land Rover	0.2%	1.4%	
Mazda	3.1%		
Mitsubishi	0.6%	1.2%	
Nissan		0.5%	
Subaru		2.2%	
Tesla			
Toyota	1.2%	0.7%	
Volvo	2.3%	0.7%	
VWA		1.5%	

For example, while Tesla obviously need not introduce additional BEVs to comply with ZEV mandates, our

analysis indicates Nissan could need to increase BEV offerings modestly to do so, and Mazda and some other

manufacturers may need to do considerably more than Nissan to introduce new BEV offerings.

This representation of CO<sub>2</sub> standards and ZEV mandates applies equally to all regulatory alternatives, and NHTSA's analysis applies the CAFE Model to examine each alternative treating each manufacturer as responding jointly to the entire set of requirements. This is distinct from model application of BEVs for compliance purposes under the compliance simulations of the different action alternatives which inform decision-makers regarding potential effects of the standards.

Chapter 1 of the TSD contains extensive discussion of the development

of the No-Action Alternative, and explains the reasons for and effect of apparent "over-compliance" with the No-Action Alternative, which reduces costs and benefits attributable to the proposed CAFE standards and other action alternatives. NHTSA seeks comment broadly on that discussion and whether and how to change its approach to developing the No-Action Alternative for the final rule. NHTSA also specifically seeks comment on whether and how to add to the No-Action Alternative for the final rule an estimation of GHG standards that

California and the Section 177 states might separately enforce if California's waiver of CAA preemption was re-established.

#### 1. No-Action Alternative

The No-Action Alternative (also sometimes referred to as "Alternative 0") applies the CAFE target curves set in 2020 for MYs 2024–2026, which raised stringency by 1.5 percent per year for both passenger cars and light trucks.

BILLING CODE 4910-59-P

**Table IV-5 – Characteristics of No-Action Alternative – Passenger Cars**

	2024	2025	2026
<i>a (mpg)</i>	51.78	52.57	53.37
<i>b (mpg)</i>	38.74	39.33	39.93
<i>c (gpm per s.f.)</i>	0.000433	0.000427	0.000420
<i>d (gpm)</i>	0.00155	0.00152	0.00150

**Table IV-6 – Characteristics of No-Action Alternative – Light Trucks**

	2024	2025	2026
<i>a (mpg)</i>	41.55	42.18	42.82
<i>b (mpg)</i>	26.82	27.23	27.64
<i>c (gpm per s.f.)</i>	0.000484	0.000477	0.000469
<i>d (gpm)</i>	0.00423	0.00417	0.00410

These equations are presented graphically in Figure IV-1 and Figure IV-2, where the x-axis represents

vehicle footprint and the y-axis represents fuel economy, showing that in "CAFE space," targets are higher in

fuel economy for smaller footprint vehicles and lower for larger footprint vehicles.

Figure IV-1 – No-Action Alternative, Passenger Car Fuel Economy Target Curves

**Figure IV-2 – No-Action Alternative, Light Truck Fuel Economy Target Curves**

NHTSA must also set a minimum standard for domestically manufactured passenger cars, which is often referred to as the “MDPCS.” Any time NHTSA

establishes or changes a passenger car standard for a model year, the MDPCS must also be evaluated or re-evaluated and established accordingly, but for

purposes of the No-Action alternative, the MDPCS is as it was established in the 2020 final rule, as shown in Table IV-7.

**Table IV-7 – No-Action Alternative - Minimum Domestic Passenger Car Standard**

2024	2025	2026
41.8 mpg	42.4 mpg	43.1 mpg

**BILLING CODE 4910-59-C**

As the baseline against which the Action Alternatives are measured, the No-Action Alternative also includes several other actions that NHTSA believes will occur in the absence of further regulatory action. First, NHTSA has included California’s ZEV mandate as part of the No-Action Alternative. NHTSA has already proposed to rescind

the 2019 “SAFE I” rule,<sup>374</sup> and EPA has reopened consideration of whether to grant California a waiver to consider its ZEV mandate,<sup>375</sup> although California does not currently possess a waiver of preemption under the CAA and NHTSA regulations currently purport to preempt the California ZEV program. Although

neither of these actions has yet been finalized, it is reasonably foreseeable that manufacturers selling vehicles in California and in the Section 177 states could be required to comply with the ZEV mandate during the timeframe of this rulemaking. Second, NHTSA has included the agreements made between California and BMW, Ford, Honda, VWA, and Volvo, because these agreements by their terms are contracts,

<sup>374</sup> 86 FR 25980 (May 12, 2021).

<sup>375</sup> 86 FR 22421 (Apr. 28, 2021).

even though they were entered into voluntarily.<sup>376</sup> NHTSA did so by including EPA’s baseline (*i.e.*, 2020) GHG standards in its analysis, and introducing more stringent GHG target functions during MYs 2022–2026, but treating only these five manufacturers as subject to these more stringent target functions. Because a significant portion of the market voluntarily adopted the California framework, presumably because the manufacturers who joined believed it could be met, and because that adoption is contractually binding once entered into, it is reasonable to assume that it will occur as expected during the rulemaking timeframe, and thus, reasonable to include in the No-Action Alternative. As in past analyses, NHTSA’s analysis further assumes that, beyond any technology applied in response to CAFE standards, EPA GHG standards, California/OEM agreements, and ZEV mandates applicable in California and the Section 177 states, manufacturers could also make any additional fuel economy improvements estimated to reduce owners’ estimated average fuel outlays during the first 30 months of vehicle operation by more than the estimated increase in new vehicle price.

NHTSA accomplished much of this through expansion of the CAFE Model after the prior rulemaking. The previous

version of the model had been extended to apply to GHG standards as well as CAFE standards but had not been published in a form that simulated simultaneous compliance with both sets of standards. As discussed at greater length in the current CAFE Model documentation, the updated version of the model simulates all the following simultaneously:

1. Compliance with CAFE standards
2. Compliance with GHG standards applicable to all manufacturers
3. Compliance with alternative GHG standards applicable to a subset of manufacturers
4. Compliance with ZEV mandates
5. Further fuel economy improvements applied if sufficiently cost-effective for buyers

Inclusion of these actions in the No-Action Alternative means that they are necessarily included in each of the Action Alternatives. That is, the impacts of all the alternatives evaluated in this proposal are against the backdrop of these State and voluntary actions by automakers. This is important to remember, because it means that automakers will be taking actions to improve fuel economy even in the absence of new CAFE standards, and that costs and benefits attributable to those actions are therefore *not*

attributable to possible future CAFE standards.

2. Alternative 1

Alternative 1 would increase CAFE stringency for MY 2024 by 9.14% for passenger cars and 11.02% for light trucks and increase stringency in MYs 2025 and 2026 by 3.26% per year for both passenger cars and light trucks. NHTSA calculates that the stringency of Alternative 1 in each of MYs 2024–2026 is equivalent to the average stringency of the California framework agreement applied to all manufacturers in those model years. NHTSA calculated the stringency values using a spreadsheet, shown in TSD Chapter 1, assuming manufacturers would achieve a one percent reduction in stringency each model year under the California framework through the application of ZEV vehicle multipliers. The spreadsheet applies a normalized stringency value of 100 percent in MY 2021 for both CO<sub>2</sub> standards and CAFE standards.

Informed by these calculations, NHTSA defined Alternative 1 by applying the CAFE equivalent stringency increases in MYs 2024–2026, resulting in the coefficients listed in Table IV–8 and Table IV–9.

BILLING CODE 4910–59–P

**Table IV-8 – Characteristics of Alternative 1 – Passenger Cars**

	2024	2025	2026
<i>a (mpg)</i>	56.15	58.04	60.00
<i>b (mpg)</i>	42.00	43.41	44.88
<i>c (gpm per s.f.)</i>	0.000400	0.000387	0.000374
<i>d (gpm)</i>	0.00141	0.00136	0.00132

**Table IV-9 – Characteristics of Alternative 1 – Light Trucks<sup>377</sup>**

	2024	2025	2026
<i>a (mpg)</i>	46.17	47.73	49.34
<i>b (mpg)</i>	27.73	28.67	29.63
<i>c (gpm per s.f.)</i>	0.000436	0.000422	0.000408
<i>d (gpm)</i>	0.00377	0.00365	0.00353

These equations are represented graphically in Figure IV–4 and Figure IV–4.

<sup>376</sup> See <https://ww2.arb.ca.gov/news/framework-agreements-clean-cars>.

<sup>377</sup> For this and other action alternatives, readers may note that the cutpoint for large trucks is further to the right than in the 2020 final rule. The 2020

final rule (and its preceding NPRM) did not contain an adjustment to the right cutpoint that had been finalized in 2012. Because comments were not received to the NPRM, the lack of adjustment was finalized. Considering the question again for this

proposal, NHTSA believes that moving the cutpoint to the right for large trucks (consistent with the intent and requirements in 2012) is reasonable, given the rate of increase in stringency for this proposal.

Figure IV-3 – Alternative 1, Passenger Car Fuel Economy, Target Curves

Figure IV-4 – Alternative 1, Light Truck Fuel Economy, Target Curves

Under this alternative, the MDPCS is as shown in Table IV-10.

Table IV-10 – Alternative 1 - Minimum Domestic Passenger Car Standard

2024	2025	2026
44.9 mpg	46.5 mpg	48.0 mpg

NHTSA considered this alternative as a way to evaluate the effects of industry-wide CAFE standards approximately harmonized with the California framework agreement applied to signatory OEMs’ production for the U.S. market.<sup>378</sup> The fact that five major

<sup>378</sup> CAFE standards defining this alternative reflect the fact that EPCA does not provide a basis for CAFE standards to include “multipliers” applicable to PHEV and/or BEV production volumes, as well as the fact that EPCA’s treatment

manufacturers voluntarily bound themselves to the framework levels, not just for MYs 2024–2026 but for MYs 2021–2026, is a relevant data point in terms of their technological feasibility and economic practicability for the fleet as a whole. NHTSA seeks comment on whether Alternative 1 (as defined by the rate of increase and the curve

of BEV energy consumption is different from the “0 grams/mile” treatment for purposes of determining compliance with GHG emissions standards.

coefficients) appropriately captures its stated goal of approximating the fuel savings that would occur under an industry-wide application of fuel economy standards harmonized with the California framework, or whether changes might be appropriate for the final rule. NHTSA asks that commenters explain the specific technical basis for any requested changes, as well as the basis for determining that the resultant CAFE standards could meet EPCA’s

requirement that NHTSA select the maximum feasible standard for each fleet in each model year.

### 3. Alternative 2

Alternative 2 would increase CAFE stringency at 8 percent per year, which NHTSA calculates would result in total lifetime fuel savings from vehicles

produced during MYs 2021–2029 similar to total lifetime fuel savings that would occur if the fuel economy standards harmonized with California framework agreement had applied to all manufacturers during MYs 2021–2026.

**Table IV-11 – Characteristics of Alternative 2 – Passenger Cars**

	2024	2025	2026
a (mpg)	55.44	60.26	65.50
b (mpg)	41.48	45.08	49.00
c (gpm per s.f.)	0.000405	0.000372	0.000343
d (gpm)	0.00144	0.00133	0.00122

**Table IV-12 – Characteristics of Alternative 2 – Light Trucks**

	2024	2025	2026
a (mpg)	44.48	48.35	52.56
b (mpg)	26.74	29.07	31.60
c (gpm per s.f.)	0.000452	0.000416	0.000382
d (gpm)	0.00395	0.00364	0.00334

Under this alternative, the MDPCS is as shown in Table IV-13.

**Table IV-13 – Alternative 2 - Minimum Domestic Passenger Car Standard**

2024	2025	2026
44.4 mpg	48.2 mpg	52.4 mpg

NHTSA considered this alternative as a way to evaluate the effects of CAFE standards that sought to achieve the fuel savings that would be achieved if fuel economy standards harmonized with the California framework agreement had been applied to all vehicle manufacturers from its beginning the time the framework was agreed. As for Alternative 1, the fact that five major manufacturers voluntarily bound themselves to these levels, not just for MYs 2024–2026 but for MYs 2021–2026, is a relevant data point in terms of their technological feasibility and economic

practicability for the fleet as a whole.<sup>379</sup> NHTSA seeks comment on whether Alternative 2 (as defined by the rate of increase and the curve coefficients) appropriately captures its stated goal of representing the fuel savings achievement that would be achieved if fuel economy standards harmonized with the California framework agreement were applied to all companies at a national level over MYs 2021–2026, or whether changes might be appropriate for the final rule. NHTSA asks that commenters explain the specific technical basis for any

requested changes, as well as the basis for determining that the resultant CAFE standards could meet EPCA's requirement that NHTSA select the maximum feasible standard for each fleet in each model year.

As another possibility, NHTSA could modify Alternative 2 by increasing the stringency of CAFE standards by 10 percent between model years 2025 and 2026, rather than by 8 percent. Shown graphically, this possibility would look as shown in Figure IV-5.

<sup>379</sup> Section VI discusses economic practicability in more detail, including NHTSA's long-standing interpretation that economic practicability need not

mean that the standards are comfortably achievable for every single manufacturer individually, as long

as they appear economically practicable for the fleet as a whole.

Figure IV-5 – Graphic Representation of Possible Other Alternative

NHTSA seeks comment on this option as well as on Alternative 2.

4. Alternative 3

Alternative 3 would increase CAFE stringency at 10 percent per year, which NHTSA calculates would result in total

lifetime fuel savings from vehicles produced during MYs 2021–2029 similar to total lifetime fuel savings that would have occurred if NHTSA had promulgated final CAFE standards for MYs 2021–2025 at the augural levels

announced in 2012 and, in addition, if NHTSA had also promulgated MY 2026 standards that reflected a continuation of that average rate of stringency increase (4.48% for passenger cars and 4.54% for light trucks).

Table IV-14 – Characteristics of Alternative 3 – Passenger Cars

	2024	2025	2026
a (mpg)	56.67	62.97	69.96
b (mpg)	42.40	47.11	52.34
c (gpm per s.f.)	0.000396	0.000356	0.000321
d (gpm)	0.00141	0.00127	0.00114

Table IV-15 – Characteristics of Alternative 3 – Light Trucks

	2024	2025	2026
a (mpg)	45.47	50.53	56.14
b (mpg)	27.34	30.38	33.75
c (gpm per s.f.)	0.000442	0.000398	0.000358
d (gpm)	0.00387	0.00348	0.00313

These equations are represented graphically in Figure IV-6 and Figure IV-7.

Figure IV-6 – Alternative 3, Passenger Car Fuel Economy, Target Curves

**Figure IV-7 – Alternative 3, Light Truck Fuel Economy, Target Curves**

Under this alternative, the MDPCS is as follows in Table IV-16.

**Table IV-16 – Alternative 3 – Minimum Domestic Passenger Car Standard**

2024	2025	2026
45.4 mpg	50.4 mpg	56.0 mpg

**BILLING CODE 4910-59-C**

NHTSA considered this alternative as a way to evaluate the effects of CAFE standards that would return to a fuel consumption trajectory exemplified by the standards announced in 2012. NHTSA seeks comment on whether Alternative 3 (as defined by the rate of increase and the curve coefficients) appropriately captures this goal, or whether changes might be appropriate for the final rule. NHTSA asks that commenters explain the specific

technical basis for any requested changes, as well as the basis for determining that the resultant CAFE standards could meet EPCA’s requirement that NHTSA select the maximum feasible standard for each fleet in each model year. While NHTSA believes that this alternative may be beyond maximum feasible based on the information currently before us, as discussed in more detail in Section VI, all alternatives remain under

consideration for the final rule. Moreover, because Alternative 3 produces significant social benefits, NHTSA seeks comment on whether to adopt a more stringent increase from MY 2025 to MY 2026, as described above, that would parallel the year over year increase Alternative 3 analyzes.

**V. Effects of the Regulatory Alternatives****A. Effects on Vehicle Manufacturers**

Each of the regulatory alternatives NHTSA has considered would increase the stringency of both passenger car and light truck CAFE standards in each of model years 2024–2026. To estimate the potential impacts of each of these alternatives, NHTSA has, as for all recent rulemakings, assumed that

standards would continue unchanged after the last model year (in this case, 2026) to be covered by newly issued standards. It is possible that the size and composition of the fleet (*i.e.*, in terms of distribution across the range of vehicle footprints) could change over time, affecting the average fuel economy requirements under both the passenger car and light truck standards, and for

the overall fleet. If fleet changes differ from NHTSA's projections, average requirements could, therefore, also differ from NHTSA's projections. At this time, NHTSA estimates that, under each of the regulatory alternatives, average fuel economy requirements could increase as summarized in the following three tables.

BILLING CODE 4910–59–P

**Table V-1 – Estimated Required Average Fuel Economy (mpg), Passenger Car Fleet for Manufacturer (Total)**

Model Year	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029
Alternative 0 (Baseline)	43.3	43.9	44.6	45.2	45.9	46.6	47.3	47.3	47.3	47.3
Alternative 1	43.3	43.9	44.6	45.2	49.8	51.5	53.2	53.2	53.2	53.2
Alternative 2	43.3	43.9	44.6	45.2	49.2	53.4	58.1	58.1	58.1	58.1
Alternative 3	43.3	43.9	44.6	45.2	50.2	55.8	62.0	62.0	62.0	62.0

Alternative 3	35.4	36.0	36.8	37.4	41.5	46.2	51.3	51.3	51.3	51.4

Manufacturers do not always comply exactly with each CAFE standard in each model year. To date, some manufacturers have tended to regularly exceed one or both requirements. Many manufacturers make use of EPCA's provisions allowing CAFE compliance credits to be applied when a fleet's CAFE level falls short of the corresponding requirement in a given model year. Some manufacturers have paid civil penalties (*i.e.*, fines) required under EPCA when a fleet falls short of a standard in a given model year and the

manufacturer cannot provide compliance credits sufficient to address the compliance shortfall. As discussed in the accompanying PRIA and TSD, NHTSA simulates manufacturers' responses to each alternative given a wide range of input estimates (*e.g.*, technology cost and efficacy, fuel prices), and, per EPCA, setting aside the potential that any manufacturer would respond to CAFE standards in model years 2024–2026 by applying CAFE compliance credits or introducing new models of alternative fuel vehicles.

Many of these inputs are subject to uncertainty and, in any event, as in all CAFE rulemakings, NHTSA's analysis merely illustrates one set of ways manufacturers could potentially respond to each regulatory alternative. At this time, NHTSA estimates that manufacturers' responses to standards defining each alternative could lead average fuel economy levels to increase through model year 2029 as summarized in the following three tables. Changes are shown to occur in MY 2023 even though NHTSA is not explicitly

proposing to regulate that model year because NHTSA anticipates that

manufacturers could make changes as early as that model year to affect future

compliance positions (*i.e.*, multi-year planning).

**Table V-4 – Estimated Achieved Average Fuel Economy (mpg), Passenger Car Fleet for Manufacturer (Total)**

Alternative 3	34.3	35.9	38.2	40.7	44.2	46.6	49.7	50.6	51.4	51.7

While these increases in average fuel economy account for estimated changes in the composition of the fleet (*i.e.*, the relative shares of passenger cars and light trucks), they result almost wholly from the projected application of fuel-saving technology. As mentioned above, NHTSA's analysis merely illustrates one set of ways manufacturers could

potentially respond to each regulatory alternative. Manufacturers' actual responses will almost assuredly differ from NHTSA's current estimates.

At this time, NHTSA estimates that manufacturers' application of advanced gasoline engines (*i.e.*, gasoline engines with cylinder deactivation, turbocharging, high or variable compression ratios) could increase

through MY 2029 under the no-action alternative and through at least MY 2024 under each of the action alternatives. However, NHTSA also estimates that in MY 2024, reliance on advanced gasoline engines could begin to decline under the more stringent action alternatives, as manufacturers shift toward electrification.

**Table V-7 – Estimated Advanced Gasoline Engine Penetration Rate, Passenger Car Fleet for Manufacturer (Total)**

For this NPRM and accompanying PRIA, NHTSA’s analysis excludes the introduction of new alternative fuel vehicle (AFV) models during MY 2024–2026 as a response to CAFE standards.<sup>380</sup> However, NHTSA’s

analysis does consider the potential that manufacturers might respond to CAFE standards by introducing new BEV models outside of MYs 2024–2026, and NHTSA’s analysis does account for the potential that ZEV mandates could lead

manufacturers to introduce new BEV models even during MYs 2024–2026. Also accounting for shifts in fleet mix, NHTSA projects increased production of BEVs through MY 2029.

<sup>380</sup> The SEIS does not make this analytical exclusion.

The PRIA provides a wider-ranging summary of NHTSA's estimates of manufacturers' potential application of fuel-saving technologies (including other types of technologies, such as advanced transmissions, aerodynamic improvements, and reduced vehicle mass) in response to each regulatory alternative. Appendices I and II of the accompanying PRIA provide much more detailed and comprehensive results, and the underlying CAFE Model output files provide all information, including the specific combination of technologies estimated to be applied to every specific vehicle model/configuration in each of model years 2020–2050.<sup>381</sup>

NHTSA's analysis shows manufacturers' regulatory costs for CAFE standards, CO<sub>2</sub> standards, and ZEV mandates increasing through MY 2029, and (logically) increasing more under the more stringent alternatives. Accounting for fuel-saving technologies estimated to be added under each regulatory alternative (including air conditioning improvements and other off-cycle technologies), and also accounting for CAFE fines that NHTSA estimates some manufacturers could elect to pay rather than achieving full compliance with CAFE standards in some model years, NHTSA estimates that relative to the continued application of MY 2020 technologies,

manufacturers' *cumulative* costs during MYs 2023–2029 could total \$121b under the no-action alternative, and \$166b, \$208b, and \$251b under alternatives 1, 2, and 3, respectively. The table below shows how these costs are estimated to vary among manufacturers, accounting for differences in the quantities of vehicles produced for sale in the U.S. Appendices I and II of the accompanying PRIA present results separately for each manufacturer's passenger car and light truck fleets in each model year under each regulatory alternative, and the underlying CAFE Model output files also show results specific to manufacturers' domestic and imported car fleets.

<sup>381</sup> See Appendices I and II of the accompanying PRIA and the CAFE Model output files.

**Table V-19 – Cumulative Costs (\$b) During MYs 2023-2029**

Manufacturer	Alternative 0	Alternative 1	Alternative 2	Alternative 3
BMW	4	4	5	6
Daimler	5	6	6	7
Stellantis (FCA)	18	21	23	25
Ford	18	22	27	33
General Motors	18	34	39	48

Tesla	0	0	0	0
Toyota	12	19	22	29
Volvo	2	2	2	3
Volkswagen	9	8	9	10
Industry Total	121	166	208	251

As discussed in the TSD, these estimates reflect technology cost inputs that, in turn, reflect a “markup” factor that includes manufacturers’ profits. In

other words, if costs to manufacturers’ are reflected in vehicle price increases as in the past, NHTSA estimates that the average costs to new vehicle purchasers

could increase through MY 2029 as summarized in Table V-20 through Table V-22.

**Table V-20 – Estimated Average Per Vehicle Regulatory Costs (\$), Passenger Car Fleet for Manufacturer (Total)**

Model Year	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029

Volvo	1,867	2,578	2,855	3,201
Volkswagen	2,459	2,408	2,547	2,937
Industry Average	1,120	1,557	2,080	2,565

NHTSA estimates that although projected fuel savings under the more stringent regulatory alternatives could tend to increase new vehicles sales, this tendency could be outweighed by the opposing response to higher prices, such that new vehicle sales could

decline slightly under the more stringent alternatives. The magnitude of these fuel savings and vehicle price increases depends on manufacturer compliance decisions, especially technology application. In the event that manufacturers select technologies with

lower prices and/or higher fuel economy improvements, vehicle sales effects could differ. For example, in the case of the “unconstrained” SEIS results, manufacturer costs across alternatives are lower.

**Figure V-1 – Estimated Annual New Vehicles Sales (Millions)**

The TSD discusses NHTSA’s approach to estimating new vehicle sales, including NHTSA’s estimate that new vehicle sales could recover from 2020’s aberrantly low levels.

While these slight reductions in new vehicles sales tend to slightly reduce projected automobile industry labor, NHTSA estimates that the cost increases could reflect an underlying increase in

employment to produce additional fuel-saving technology, such that automobile industry labor could about the same under each of the four regulatory alternatives.

**Figure V-2 – Estimated Automobile Industry Labor (as Millions of Full-Time-Equivalent Jobs)**

The accompanying TSD discusses NHTSA’s approach to estimating automobile industry employment, and the accompanying RIA (and its Appendices I and II) and CAFE Model output files provide more detailed results of NHTSA’s analysis.

*B. Effects on New Car and Truck Buyers*  
 As discussed above, NHTSA estimates that the average fuel economy and purchase cost of new vehicles could increase between 2020 and 2029 and increase more quickly under each of the action alternatives than under the baseline No-Action Alternative. On one hand, buyers could realize the benefits

of increase fuel economy: Spending less on fuel. On the other, buyers could pay more for new vehicles, for some costs tied directly to vehicle value (e.g., sales taxes and collision insurance). Table V-24 reports sales-weighted MSRP values for the No-Action Alternative and relative increases in MSRP for the three regulatory alternatives.

**Table V-24 – Sales-Weighted MSRP and Incremental Costs Under the Regulatory Alternatives by Regulatory Class, Undiscounted 2018\$**

Table V-25 through Table V-27 presents projected consumer costs and benefits along with net benefits for model year 2029 and 2039 vehicles under the proposed alternatives. Results are shown in 2018 dollars, without discounting and with benefits and costs

discounted at annual rates of 3% and 7%. The TSD and PRA accompanying this NPRM discuss underlying methods, inputs, and results in greater detail, and more detailed tables and underlying results are contained in the accompanying CAFE Data Book and

CAFE Model output files. For all of the action alternatives, avoided outlays for fuel purchases account for most of the projected benefits to consumers, and increases in the cost to purchase new vehicles account for most of the projected costs.

**BILLING CODE 4910-59-C***C. Effects on Society*

Table V-28 and Table V-29 describe the costs and benefits of increasing CAFE standards in each alternative, as well as the party to which they accrue. Manufacturers are directly regulated under the program and incur additional production costs when they apply technology to their vehicle offerings in order to improve their fuel economy. In this analysis, we assume that those costs are fully passed through to new car and

truck buyers, in the form of higher prices. Other assumptions are possible, but we do not currently have data to support attempting to model cross-subsidization. We also assume that any civil penalties—paid by manufacturers for failing to comply with their CAFE standards—are passed through to new car and truck buyers and are included in the sales price. However, those civil penalties are paid to the U.S. Treasury, where they currently fund the general business of Government. As such, they are a transfer from new vehicle buyers

to all U.S. citizens, who then benefit from the additional Federal revenue. While they are calculated in the analysis, and do influence consumer decisions in the marketplace, they do not contribute to the calculation of net benefits (and are omitted from the tables below). While incremental maintenance and repair costs would accrue to buyers of new cars and trucks affected by more stringent CAFE standards, we do not carry these costs in the analysis. They are difficult to estimate for emerging

technologies but represent real costs (and benefits in the case of alternative fuel vehicles that may require less frequent maintenance events). They may be included in future analyses as data become available to evaluate lifetime maintenance costs. This analysis assumes that drivers of new vehicles internalize 90 percent of the risk associated with increased exposure to crashes when they engage in additional travel (as a consequence of the rebound effect).

Private benefits are dominated by the value of fuel savings, which accrue to new car and truck buyers at retail fuel prices (inclusive of Federal and state taxes). In addition to saving money on fuel purchases, new vehicle buyers also benefit from the increased mobility that results from the lower cost of driving their vehicle (higher fuel economy reduces the per-mile cost of travel) and fewer refueling events. The additional travel occurs as drivers take advantage of lower operating costs to increase mobility, and this generates benefits to those drivers—equivalent to the cost of operating their vehicles to travel those miles, the consumer surplus, and the offsetting benefit that represents 90 percent of the additional safety risk from travel.

In addition to private benefits and costs, there are purely external benefits and costs that can be attributed to increases in CAFE standards. These are benefits and costs that accrue to society more generally, rather than to the specific individuals who purchase a new vehicle that was produced under more stringent CAFE standards. Of the external costs, the largest is the loss in fuel tax revenue that occurs as a result of falling fuel consumption. While drivers of new vehicles (purchased in years where CAFE stringency is increasing) save fuel costs at retail prices, the rest of U.S. road users experience a welfare loss, in two ways. First, the revenue generated by fuel taxes helps to maintain roads and bridges, and improve infrastructure more generally, and that loss in fuel tax revenue is a social cost. And second, the additional driving that occurs as new vehicle buyers take advantage of lower per-mile fuel costs is a benefit to those drivers, but the congestion (and road noise) created by the additional travel impose a social cost to all road users.

Among the purely external benefits created when CAFE standards are increased, the largest is the reduction in damages resulting from greenhouse gas emissions. The estimates in Table V–28

assume a social cost of GHG emissions based on a 2.5% discount rate, and those in Table V–29 assume a social cost of GHG emissions based on a 3% discount rate. The associated benefits related to reduced health damages from conventional pollutants and the benefit of improved energy security are both significantly smaller than the associated change in GHG damages across alternatives. As the tables also illustrate, the overwhelming majority of both costs and benefits are private costs and benefits that accrue to buyers of new cars and trucks, rather than external welfare changes that affect society more generally. This has been consistently true in CAFE rulemakings.

The choice of discount rate also affects the resulting benefits and costs. As the tables show, net social benefits are positive for Alternative 1 and 2 at a 3% discount rate, but only for Alternative 1 when applying a 7% discount rate to benefits and costs. Alternative 3 has negative net benefits under both discount rates. As mentioned above, the benefits of the regulatory alternatives, but especially Alternative 3, are concentrated in later years where a higher discount rate has a greater contracting effect.

The following tables show the costs and benefits associated with external effects to society. As seen in Table V-28 and Table V-29, the external benefits are composed of reduced climate damages (Table V-30 and Table V-31), reduced health damages (Table V-32

and Table V-33), and reduced petroleum market externalities (Table V-36). The external costs to society include congestion and noise costs (Table V-34 and Table V-35) and safety costs (Table V-37). We show the costs and benefits by model year (1981-2029),

in contrast to the tables above, which present incremental and net costs and benefits over the lifetimes of the entire fleet produced through 2029, beginning with model year 1981.

Table V-30 and Table V-31 present the total costs of GHGs in the baseline scenario and the incremental costs relative to the baseline in the other three alternatives. Negative incremental values indicate a decrease in social costs

of GHGs, while positive incremental values indicate an increase in costs relative to the baseline for the given model year. The GHG costs follow a similar pattern in all three alternatives, decreasing across all model years, with

the largest reductions associated with 2025-2028 model years. The magnitude of CO<sub>2</sub> emissions is much higher than the magnitudes of CH<sub>4</sub> and N<sub>2</sub>O emissions, which is why the total costs are so much larger for CO<sub>2</sub>.

The CAFE Model calculates health costs attributed to criteria pollutant

emissions of NO<sub>x</sub>, SO<sub>x</sub>, and PM<sub>2.5</sub>, shown in Table V-32 and Table V-33.

These costs are directly related to the tons of each pollutant emitted from

various upstream and downstream sources, including on-road vehicles, electricity generation, fuel refining, and fuel transportation and distribution. See Chapter 4 of the SEIS and Chapter 5.4 of the TSD for further information regarding the calculations used to estimate health impacts, and more details about the types of health effects. The following section of the preamble, V.D, discusses the changes in tons of emissions themselves across rulemaking alternatives, while the current section

focuses on the changes in social costs associated with those emissions.

Criteria pollutant health costs (presented in Table V-32 and Table V-35) increase slightly in earlier model years (1981-2023), but those cost increases are offset by the decrease in health costs in later model years. In Table V-32 and Table V-33, the costs in alternatives 1-3 are shown in terms of percent of the baseline. For instance, the total decrease in SO<sub>x</sub> costs in Alternative 2 is equivalent to 0.2% of

the total baseline SO<sub>x</sub> costs. The changes across alternatives relative to the baseline are relatively minor, although some impacts in later model years are more significant (e.g., 7.5% decrease in PM<sub>2.5</sub> in 2028, Alternative 3). Since the health cost value per ton of emissions differs by pollutant, the pollutants that incur the highest costs are not necessarily those with the largest amount of emissions.

NHTSA estimates social costs of congestion and noise across regulatory alternatives, throughout the lifetimes of model years 1981–2029. Congestion and noise are functions of VMT and fleet mix, and the differences between alternatives are due mainly to differences in VMT (see Section V.D).

Overall, congestion and noise costs increase relative to the baseline across all alternatives, but viewed from a model year perspective, the congestion and noise costs associated with later model years are negative relative to the baseline. It is important to note that the overall increases in congestion and

noise costs are relatively small when compared to the total congestion and noise costs in the baseline (No-Action Alternative). For further details regarding congestion and noise costs, see Chapter 6.2.3 of the TSD and Chapter 6.5 of the PRIA.

The CAFE Model accounts for benefits of increased energy security by computing changes in social costs of petroleum market externalities. These social costs represent the risk to the U.S. economy incurred by exposure to price shocks in the global petroleum market that are not accounted for by oil prices and are a direct function of gallons of

fuel consumed. Chapter 6.2.4 of the accompanying TSD describes the inputs involved in calculating these petroleum market externality costs. Petroleum market externality costs decrease relative to the baseline under all alternatives, regardless of the discount rate used. This pattern occurs due to the decrease in gallons of fuel consumed

(see Section V.D) as the stringency of alternatives increases. Only the earlier model year cohorts (1981–2023) contribute to slight increases in petroleum market externality costs, but these are offset by the decreases from later model years.

NHTSA estimates various monetized safety impacts across regulatory alternatives, including costs of fatalities, non-fatal crash costs, and property

damage costs. Table V-37 presents these social costs across alternatives and discount rates. Safety effects are discussed at length in the PRIA

accompanying this NPRM (see Chapter 5 of the PRIA).

**Table V-37 – Total Social Costs of Safety Impacts (2018\$, billions), MY 1981-2029, All Alternatives**

BILLING CODE 4910-59-C

*D. Physical and Environmental Effects*

NHTSA calculates estimates for the various physical and environmental effects associated with the proposed standards. These include quantities of fuel and electricity consumption, tons of greenhouse gas (GHG) emissions and criteria pollutants, and health and safety impacts.

In terms of fuel and electricity usage, NHTSA estimates that the proposal would save about 50 billion gallons of gasoline and increase electricity consumption by about 275 TWh over the lives of vehicles produced prior to MY 2030, relative to the baseline standards (*i.e.*, the No-Action Alternative). From a calendar year perspective, NHTSA’s analysis also estimates total annual consumption of

fuel by the entire on-road fleet from calendar year 2020 through calendar year 2050. On this basis, gasoline and electricity consumption by the U.S. light-duty vehicle fleet evolves as shown in the following two graphs, each of which shows projections for the No-Action Alternative (Alternative 0, *i.e.*, the baseline), Alternative 1, Alternative 2 (the proposal), and Alternative 3.

BILLING CODE 4910-59-P

**Figure V-3 – Estimated Annual Gasoline Consumption by Light-Duty On-Road Fleet**

**Figure V-4 – Estimated Electricity Consumption by Light-Duty On-Road Fleet**

NHTSA estimates the greenhouse gas emissions (GHGs) attributable to the light-duty on-road fleet, from both vehicles and upstream energy sector processes (e.g., petroleum refining, fuel transportation and distribution, electricity generation). Overall, NHTSA estimates that the proposed rule would

reduce greenhouse gases by about 465 million metric tons of carbon dioxide (CO<sub>2</sub>), about 500 thousand metric tons of methane (CH<sub>4</sub>), and about 12 thousand tons of nitrous oxide (N<sub>2</sub>O). The following three graphs (Figure V-5, Figure V-6, and Figure V-7) present NHTSA’s estimate of how emissions

from these three GHGs could evolve over the years. Note that these graphs include emissions from both vehicle and upstream processes. All three GHG emissions follow similar trends in the years between 2020–2050.

Figure V-5 – Estimated Annual CO<sub>2</sub> Emissions Attributable to Light-Duty On-Road Fleet

Figure V-6 – Estimated Annual CH<sub>4</sub> Emissions Attributable to Light-Duty On-Road Fleet

**Figure V-7 – Estimated Annual N<sub>2</sub>O Emissions Attributable to Light-Duty On-Road Fleet**

The figures presented here are not the only estimates NHTSA has calculated regarding projected GHG emissions in future years. As discussed in Section II, the accompanying SEIS uses an “unconstrained” analysis as opposed to the “standard setting” analysis presented in this NPRM and PRIA. For more information regarding projected GHG emissions, as well as model-based estimates of corresponding impacts on several measures of global climate change, see the SEIS.

NHTSA also estimates criteria pollutant emissions resulting from vehicle and upstream processes attributable to the light-duty on-road fleet. NHTSA includes estimates for all

of the criteria pollutants for which EPA has issued National Ambient Air Quality Standards. Under each regulatory alternative, NHTSA projects a dramatic decline in annual emissions of carbon monoxide (CO), volatile organic compounds (VOC), nitrogen oxide (NO<sub>x</sub>), and fine particulate matter (PM<sub>2.5</sub>) attributable to the light-duty on-road fleet between 2020 and 2050. As exemplified in Figure V-8, emissions in any given year could be very nearly the same under each regulatory alternative.

On the other hand, as discussed in the PRIA and SEIS accompanying this NPRM, NHTSA projects that annual SO<sub>2</sub> emissions attributable to the light-duty on-road fleet could increase modestly

under the action alternatives, because, as discussed above, NHTSA projects that each of the action alternatives could lead to greater use of electricity (for PHEVs and BEVs). The adoption of actions—such as actions prompted by President Biden’s Executive order directing agencies to develop a Federal Clean Electricity and Vehicle Procurement Strategy—to reduce electricity generation emission rates beyond projections underlying NHTSA’s analysis (discussed in the TSD) could dramatically reduce SO<sub>2</sub> emissions under all regulatory alternatives considered here.<sup>382</sup>

Figure V-9 – Estimated Annual SO<sub>2</sub> Emissions Attributable to Light-Duty On-Road Fleet

**Figure V-10 – Estimated Annual PM<sub>2.5</sub> Emissions Attributable to Light-Duty On-Road Fleet**

Health impacts quantified by the CAFE Model include various instances of hospital visits due to respiratory problems, minor restricted activity days, non-fatal heart attacks, acute bronchitis, premature mortality, and other effects of criteria pollutant emissions on health.

Figure V-11 shows the differences in select health impacts relative to the baseline, across alternatives 1-3. These changes are split between calendar year decades, with the largest differences between the baseline and alternatives occurring between 2041-2050. The

magnitude of the differences relates directly to the changes in tons of criteria pollutants emitted. See Chapter 5.4 of the TSD for information regarding how the CAFE Model calculates these health impacts.

**Figure V-11 – Changes in Cumulative Emission Health Impacts Relative to the Baseline**

Lastly, NHTSA also quantifies safety impacts in its analysis. These include estimated counts of fatalities, non-fatal injuries, and property damage crashes occurring over the lifetimes of the light-duty on-road vehicles considered in the analysis. Chapter 5 in the PRIA accompanying this NPRM contains an in-depth discussion on the effects of the various alternatives on these safety measures, and TSD Chapter 7 contains information regarding the construction of the safety estimates.

*E. Sensitivity Analysis*

The analysis conducted to support this proposal consists of data, estimates, and assumptions, all applied within an analytical framework, the CAFE Model. Just like in all past CAFE rulemakings, NHTSA recognizes that many analytical inputs are uncertain, and some inputs are very uncertain. Of those uncertain inputs, some are likely to exert considerable influence over specific types of estimated impacts, and some are likely to do so for the bulk of the

analysis. Yet making assumptions in the face of that uncertainty is necessary, if we are going to try to analyze meaningfully the effects of something that will happen in the future—*i.e.*, the regulatory alternatives being considered, that represent different possible CAFE standards for MYs 2024–2026. To get a sense of the effect that these assumptions have on the analytical findings, we conducted additional model runs with alternative assumptions, which explored a range of potential inputs and the sensitivity of estimated impacts to changes in model inputs. Sensitivity cases in this analysis span assumptions related to technology applicability and cost, economic conditions, consumer preferences, externality values, and safety assumptions, among others.<sup>383</sup> A sensitivity analysis can identify two critical pieces of information: *How big an influence* does each parameter exert on the analysis, and *how sensitive are the model results* to that assumption?

That said, influence is different from likelihood. NHTSA does not mean to suggest that any one of the sensitivity cases presented here is inherently more likely than the collection of assumptions that represent the reference case in the figures and tables that follow. Nor is this sensitivity analysis intended to suggest that only one of the many assumptions made is likely to prove off-base with the passage of time or new observations. It is more likely that, when assumptions are eventually contradicted by future observation (*e.g.*, deviations in observed and predicted fuel prices are nearly a given), there will be *collections* of assumptions, rather than individual parameters, that simultaneously require updating. For this reason, we do not interpret the sensitivity analysis as necessarily providing justification for alternative regulatory scenarios to be preferred. Rather, the analysis simply provides an indication of which assumptions are most critical, and the extent to which future deviations from central analysis

<sup>383</sup>In contrast to an uncertainty analysis, where many assumptions are varied simultaneously, the sensitivity analyses included here vary a single

assumption and provide information about the influence of each individual factor, rather than

suggesting that an alternative assumption would have justified a different preferred alternative.

assumptions could affect costs and benefits of this proposal.

Table V-38 lists and briefly describes the cases that we examined in the sensitivity analysis.

**Table V-38 – Cases Included in Sensitivity Analysis**

Sensitivity Case	Description
Reference case (RC)	Reference case with 2.5% SCC discount rate
RC w/ 7% social DR, 3% SC-GHG DR	Reference case with 3% SCC discount rate (DR) (for 7% social discount rate)
RC w/ 7% social DR, 5% SC-GHG DR	Reference case with 5% SCC discount rate
RC w/ 95th pctile SC-GHG DR	Reference case with 95th percentile SCC discount rate
2020 SCC	Social cost of carbon values at 2020 Final Rule levels
One-year redesign cadence	Vehicles redesigned every year
MR5/6 skip (>100k)	MR5 and MR6 skipped for platforms with 100k or more units
MR5/6 skip (>2k)	MR5 and MR6 skipped for platforms with 2k or more units
No MR5/6 skip	No MR5 or MR6 application applied without SKIP restriction
2020 Final Rule MR5/6 costs	Cost values for MR5 and MR6 at levels from 2020 Final Rule
No HCR skip	HCR engine applicable for all OEMs and technology classes
Flat AC/OC	No additional AC or OC credit accumulation after MY 2021 levels
Reduced MDPCS stringency	Minimum domestic passenger car standard reduced as described in Section VI of the preamble
60-month payback period	60-month payback period
Battery direct costs (-20%)	Battery direct manufacturing cost decreased by 20%, reference battery learning cost
Battery direct costs (+20%)	Battery direct manufacturing cost increased by 20%, reference battery learning cost
Battery learning costs (-20%)	Battery learning cost decreased by 20%, reference direct manufacturing cost
Battery learning costs (+20%)	Battery learning cost increased by 20%, reference direct manufacturing cost
Rebound (10%)	Ten percent rebound effect
Rebound (20%)	Twenty percent rebound effect
Mass-size-safety (low)	The lower bound of the 95% CI for all model coefficients
Mass-size-safety (high)	The upper bound of the 95% CI for all model coefficients
Crash avoidance (low effectiveness)	Lower-bound estimate of effectiveness for 6 current crash avoidance technologies at avoiding fatal, injury, and property damage
Crash avoidance (high effectiveness)	Upper-bound estimate of effectiveness for 6 current crash avoidance technologies at avoiding fatal, injury, and property damage
Sales-scrappage response (-20%)	Sales-scrappage elasticity decreased by 20%
Sales-scrappage response (+20%)	Sales-scrappage elasticity increased by 20%
Low GDP	Low economic growth (AEO2021)
High GDP	High economic growth (AEO2021)
Oil price (EIA low)	Input oil price series based on EIA low forecast
Oil price (Global Insight)	Input oil price series based on Global Insight forecast
Oil price (EIA high)	Input oil price series based on EIA high forecast

Complete results for the sensitivity cases are summarized in Chapter 7 of the accompanying PRIA, and detailed model inputs and outputs for curious

readers are available on NHTSA’s website.<sup>384</sup> For purposes of this preamble, Figure V–12 below illustrates the relative change of the sensitivity

effect of selected inputs on the costs and benefits that we estimate for the proposal.

Figure V-12 – Relative Change in Total Costs and Total Benefits from Reference Case

While Figure V–12 does not show precise values, it gives us a sense of which inputs are ones for which a different assumption would have a much different effect on analytical findings, and which ones would not have much effect. Assuming a more-discounted or lower social cost of carbon would have a relatively large effect, as would assuming a different oil price, or doubling the assumed

“payback period.” Making very high levels of mass reduction unavailable in the modeling appears to have a (relatively) very large effect on costs, but this is to some extent an artifact of the “standard setting” runs used for the preamble and PRIA analysis, where electrification is limited due to statutory restrictions. On the other hand, assumptions about which there has been significant disagreement in the past, like

the rebound effect or the sales-scrappage response, appear to cause only relatively small changes in net benefits. Chapter 7 of the PRIA provides a much fuller discussion of these findings, and presents net benefits estimated under each of the cases included in the sensitivity analysis, including the subset for which impacts are summarized in Figure V–13.

<sup>384</sup> <https://www.nhtsa.gov/laws-regulations/corporate-average-fuel-economy>.

Figure V-13 – Relative Magnitude of Sensitivity Effect on Net Benefits

**BILLING CODE 4910–59–C**

The results presented in the earlier subsections of Section V and discussed in Section VI reflect the agency's best judgments regarding many different factors, and the sensitivity analysis discussed here is simply to illustrate the obvious, that differences in assumptions can lead to differences in analytical outcomes, some of which can be large and some of which may be smaller than expected. Policy-making in the face of future uncertainty is inherently complex. Section VI explains how NHTSA proposes to balance the statutory factors in light of the analytical findings, the uncertainty that we know exists, and our Nation's policy goals, to determine the CAFE standards that NHTSA tentatively concludes are maximum feasible for MYs 2024–2026.

**VI. Basis for NHTSA's Tentative Conclusion That the Proposed Standards Are Maximum Feasible**

In this section, NHTSA discusses the factors, data, and analysis that the agency has considered in the tentative selection of the proposed CAFE standards for MYs 2024–2026. The primary purpose of EPCA, as amended by EISA, and codified at 49 U.S.C. chapter 329, is energy conservation, and fuel economy standards help to conserve energy by requiring automakers to make new vehicles travel a certain distance on a gallon of fuel.<sup>385</sup>

<sup>385</sup> While individual vehicles need not meet any particular mpg level, as discussed elsewhere in this preamble, fuel economy standards do require vehicle manufacturers' fleets to meet certain compliance obligations based on fuel economy

The goal of the CAFE standards is to conserve energy, while taking into account the statutory factors set forth at 49 U.S.C. 32902(f), as discussed below.

The provision at 49 U.S.C. 32902(f) states that when setting maximum feasible CAFE standards for new passenger cars and light trucks, the Secretary of Transportation<sup>386</sup> "shall consider technological feasibility, economic practicability, the effect of other motor vehicle standards of the Government on fuel economy, and the need of the United States to conserve energy." In previous rulemakings, including the 2012 final rule issued during the Obama Administration and the recent 2020 final rule, NHTSA considered technological feasibility, including the availability of various fuel-economy-improving technologies to be applied to new vehicles in the timeframe of the standards depending on the ultimate stringency levels, and also considered economic practicability, including the differences between a range of regulatory alternatives in terms of effects on per-vehicle costs, the ability of both the industry and individual manufacturers to comply with standards at various levels, as well as effects on vehicle sales, industry employment, and consumer demand. NHTSA also considered how compliance with other motor vehicle standards of the Government might affect manufacturers' ability to meet CAFE standards represented by a range

levels target curves set forth by NHTSA in regulation.

<sup>386</sup> By delegation, the NHTSA Administrator.

of regulatory alternatives, and how the need of the U.S. to conserve energy could be more or less addressed under a range of regulatory alternatives, in terms of considerations like costs to consumers, the national balance of payments, environmental implications like climate and smog effects, and foreign policy effects such as the likelihood that U.S. military and other expenditures could change as a result of more or less oil consumed by the U.S. vehicle fleet. These elements are discussed in detail throughout this analysis. As will be explained in greater detail below, while NHTSA is considering all of the same factors in proposing revised CAFE standards for MYs 2024–2026 that it considered in previous rulemakings, the agency's balancing of those factors has shifted, and NHTSA is therefore choosing to set CAFE standards at a different level from what both the 2012 final rule and the 2020 final rule set forth. Besides the factors specified in 32902(f), NHTSA has also historically considered the safety effects of potential CAFE standards, and additionally considers relevant case law.

NHTSA and EPA have coordinated in setting standards, and many of the factors that NHTSA considers to set maximum feasible standards complement factors that EPA considers under the Clean Air Act. The balancing of competing factors by both EPA and NHTSA are consistent with each agency's statutory authority and recognize the statutory obligations the Supreme Court pointed to in *Massachusetts v. EPA*. NHTSA also

considers the Ninth Circuit's decision in *Center for Biological Diversity v. NHTSA*, which remanded NHTSA's 2006 final rule establishing standards for MYs 2008–2011 light trucks and underscored that “the overarching purpose of EPCA is energy conservation.”<sup>387</sup>

This proposal contains a range of regulatory alternatives for MYs 2024–2026, from retaining the 1.5 percent annual increases set in 2020, up to a stringency increase of 10 percent annually. The analysis supported this range of alternatives based on factors relevant to NHTSA's exercise of its 32902(f) authority, such as fuel saved and emissions reduced, the technologies available to meet the standards, the costs of compliance for automakers and their abilities to comply by applying technologies, the impact on consumers with respect to cost, fuel savings, and vehicle choice, and effects on safety, among other things.

NHTSA's tentative conclusion, after consideration of the factors described below and information in the administrative record for this action, is that 8 percent increases in stringency for MYs 2024–2026 (Alternative 2 of this analysis) are maximum feasible. The Biden Administration is deeply committed to working aggressively to improve energy conservation, and higher standards appear increasingly likely to be economically practicable given almost-daily announcements by major automakers about forthcoming new high-fuel-economy vehicle models, as described below. Despite only one year having passed since the 2020 final rule, enough has changed in the U.S. and the world that revisiting the CAFE standards for MYs 2024–2026, and raising their stringency considerably, is both appropriate and reasonable.

The following sections discuss in more detail the statutory requirements and considerations involved in NHTSA's tentative determination of maximum feasible CAFE standards, and NHTSA's explanation of its balancing of factors for this tentative determination.

#### A. EPCA, as Amended by EISA

EPCA, as amended by EISA, contains a number of provisions regarding how NHTSA must set CAFE standards. DOT (by delegation, NHTSA)<sup>388</sup> must establish separate CAFE standards for passenger cars and light trucks<sup>389</sup> for

each model year,<sup>390</sup> and each standard must be the maximum feasible that the Secretary (again, by delegation, NHTSA) believes the manufacturers can achieve in that model year.<sup>391</sup> In determining the maximum feasible levels of CAFE standards, EPCA requires that NHTSA consider four statutory factors: Technological feasibility, economic practicability, the effect of other motor vehicle standards of the Government on fuel economy, and the need of the United States to conserve energy.<sup>392</sup> In addition, NHTSA has the authority to consider (and typically does consider) other relevant factors, such as the effect of CAFE standards on motor vehicle safety and consumer preferences. The ultimate determination of what standards can be considered maximum feasible involves a weighing and balancing of factors, and the balance may shift depending on the information before NHTSA about the expected circumstances in the model years covered by the rulemaking. The agency's decision must also be guided by the overarching purpose of EPCA, energy conservation, while balancing these factors.<sup>393</sup>

Besides the requirement that the standards be maximum feasible for the fleet in question and the model year in question, EPCA/EISA also contain several other requirements, as follow.

##### 1. Lead Time

EPCA requires that NHTSA prescribe new CAFE standards at least 18 months before the beginning of each model year.<sup>394</sup> For amendments to existing standards (as this NPRM proposes), EPCA requires that if the amendments make an average fuel economy standard more stringent, at least 18 months of lead time must be provided.<sup>395</sup> Thus, if the first year for which NHTSA is proposing to amend standards in this NPRM is MY 2024, NHTSA interprets this provision as requiring the agency to issue a final rule covering MY 2024 standards no later than April 2022.

##### 2. Separate Standards for Cars and Trucks, and Minimum Standards for Domestic Passenger Cars

As mentioned above, EPCA requires NHTSA to set separate standards for passenger cars and light trucks for each

model year.<sup>396</sup> NHTSA has long interpreted this requirement as preventing the agency from setting a single combined CAFE standard for cars and trucks together, based on the plain language of the statute. Congress originally required separate CAFE standards for cars and trucks to reflect the different fuel economy capabilities of those different types of vehicles, and over the history of the CAFE program, has never revised this requirement. Even as many cars and trucks have come to resemble each other more closely over time—many crossover and sport-utility models, for example, come in versions today that may be subject to either the car standards or the truck standards depending on their characteristics—it is still accurate to say that vehicles with truck-like characteristics such as 4-wheel drive, cargo-carrying capability, etc., currently consume more fuel per mile than vehicles without these characteristics.

EPCA, as amended by EISA, also requires another separate standard to be set for domestically-manufactured<sup>397</sup> passenger cars. Unlike the generally-applicable standards for passenger cars and light trucks described above, the compliance obligation of the minimum domestic passenger car standard (MDPCS for brevity) is identical for all manufacturers. The statute clearly states that any manufacturer's domestically manufactured passenger car fleet must meet the greater of either 27.5 mpg on average, or 92 percent of the average fuel economy projected by the Secretary for the combined domestic and non-domestic passenger automobile fleets manufactured for sale in the United States by all manufacturers in the model year, which projection shall be published in the **Federal Register** when the standard for that model year is promulgated in accordance with 49 U.S.C. 32902(b).<sup>398</sup>

Since that requirement was promulgated, the “92 percent” has always been greater than 27.5 mpg, and foreseeably will continue to be so in the future. While NHTSA published 92 percent MDPCSs for MYs 2024–2026 at 49 CFR 531.5(d) as part of the 2020 final rule, the statutory language is clear that

<sup>396</sup> 49 U.S.C. 32902(b)(1) (2007).

<sup>397</sup> In the CAFE program, “domestically-manufactured” is defined by Congress in 49 U.S.C. 32904(b). The definition roughly provides that a passenger car is “domestically manufactured” as long as at least 75 percent of the cost to the manufacturer is attributable to value added in the United States, Canada, or Mexico, unless the assembly of the vehicle is completed in Canada or Mexico and the vehicle is imported into the United States more than 30 days after the end of the model year.

<sup>398</sup> 49 U.S.C. 32902(b)(4) (2007).

<sup>387</sup> 538 F.3d 1172 (9th Cir. 2008).

<sup>388</sup> EPCA and EISA direct the Secretary of Transportation to develop, implement, and enforce fuel economy standards (see 49 U.S.C. 32901 *et seq.*), which authority the Secretary has delegated to NHTSA at 49 CFR 1.95(a).

<sup>389</sup> 49 U.S.C. 32902(b)(1) (2007).

<sup>390</sup> 49 U.S.C. 32902(a) (2007).

<sup>391</sup> *Id.*

<sup>392</sup> 49 U.S.C. 32902(f) (2007).

<sup>393</sup> *Center for Biological Diversity v. NHTSA*, 538 F.3d 1172, 1197 (9th Cir. 2008) (“Whatever method it uses, NHTSA cannot set fuel economy standards that are contrary to Congress's purpose in enacting the EPCA—energy conservation.”).

<sup>394</sup> 49 U.S.C. 32902(a) (2007).

<sup>395</sup> 49 U.S.C. 32902(g)(2) (2007).

the MDPCS must be determined at the time an overall passenger car standards is promulgated and published in the **Federal Register**. Thus, any time NHTSA establishes or changes a passenger car standard for a model year, the MDPCS must also be evaluated or re-evaluated and established accordingly.

As in the 2020 final rule, NHTSA recognizes industry concerns that actual total passenger car fleet standards have differed significantly from past projections, perhaps more so when the agency has projected significantly into the future. In that final rule, because the compliance data showed that the standards projected in 2012 were consistently more stringent than the actual standards, by an average of 1.9 percent. NHTSA stated that this difference indicated that in rulemakings conducted in 2009 through 2012, NHTSA's and EPA's projections of passenger car vehicle footprints and production volumes, in retrospect, underestimated the production of larger passenger cars over the MYs 2011 to 2018 period.<sup>399</sup>

Unlike the passenger car standards and light truck standards which are vehicle-attribute-based and automatically adjust with changes in consumer demand, the MDPCS are *not* attribute-based, and therefore do not adjust with changes in consumer demand and production. They are

instead fixed standards that are established at the time of the rulemaking. As a result, by assuming a smaller-footprint fleet, on average, than what ended up being produced, the MYs 2011–2018 MDPCS ended up being more stringent and placing a greater burden on manufacturers of domestic passenger cars than was projected and expected at the time of the rulemakings that established those standards. In the 2020 final rule, therefore, NHTSA agreed with industry concerns over the impact of changes in consumer demand (as compared to what was assumed in 2012 about future consumer demand for greater fuel economy) on manufacturers' ability to comply with the MDPCS and in particular, manufacturers that produce larger passenger cars domestically. Some of the largest civil penalties for noncompliance in the history of the CAFE program have been paid for noncompliance with the MDPCS. NHTSA also expressed concern that consumer demand may shift even more in the direction of larger passenger cars if fuel prices continue to remain low. Sustained low oil prices can be expected to have real effects on consumer demand for additional fuel economy, and consumers may foreseeably be even more interested in 2WD crossovers and passenger-car-fleet SUVs (and less interested in smaller passenger cars) than they are at present.

Therefore, in the 2020 final rule, to help avoid similar outcomes in the 2021–2026 timeframe to what had happened with the MDPCS over the preceding model years, NHTSA determined that it was reasonable and appropriate to consider the recent projection errors as part of estimating the total passenger car fleet fuel economy for MYs 2021–2026. NHTSA therefore projected the total passenger car fleet fuel economy using the central analysis value in each model year, and applied an offset based on the historical 1.9 percent difference identified for MYs 2011–2018.

For this proposal, recognizing that we are proposing to increase stringency considerably over the baseline standards and that civil penalties have also recently increased, NHTSA remains concerned that the MDPCS may pose a significant challenge to certain manufacturers. To that end, NHTSA is proposing to retain the 1.9 percent offset for the MDPCS for MYs 2024–2026, which we have appropriately recalculated based on the current projections for passenger cars based on the current analysis fleet. Table VI–1 shows the calculation values used to determine the total passenger car fleet fuel economy value for each model year for the preferred alternative.

BILLING CODE 4910–59–P

**Table VI-1 – Calculation of the Projected Total Passenger Car Fleet Standard and the Minimum Domestic Passenger Car Standard (92 Percent of the Total Passenger Car Standard) for the Preferred Alternative**

	2024	2025	2026
Projected Total PC Fleet Standard – Central Analysis (mpg)	49.2	53.4	58.1
Offset: Average Historical Difference Between Regulatory Analyses and Actual Total PC Fleet Standard (percent)	-1.9	-1.9	-1.9
Offset: Average Historical Difference Between Regulatory Analyses and Actual Total PC Fleet Standard (mpg)	-0.92	-1.00	-1.08
Projected Total PC Standard Accounting for Historical Offset (mpg)	48.2	52.4	57.0
Minimum Domestic Passenger Car Standard = 92% of Projected Total PC Standard Accounting for Historical Offset (mpg)	44.4	48.2	52.4

Using this approach, the MDPCS under each regulatory alternative would thus be as shown in Table VI–2.

<sup>399</sup> See 85 FR at 25127 (Apr. 30, 2020).

**Table VI-2 – Proposed MDPCS for Each Regulatory Alternative, Calculated per 1.9 Percent Offset**

Alternative	MY 2024	MY 2025	MY 2026
No Action	41.4	42.1	42.7
Alternative 1	44.9	46.5	48.0
Alternative 2 (Preferred)	44.4	48.2	52.4
Alternative 3	45.4	50.4	56.0

NHTSA is also seeking comment on another approach to offsetting the MDPCS. Recognizing that the analysis supporting this proposal does not attempt to project how vehicle footprints may change in the future, nor how that might affect the average fuel economy of passenger cars sold in the

U.S., NHTSA could instead attempt to make such a projection explicitly. Examination of the average footprints of passenger cars sold in the U.S. from 2008, when EPA began reporting footprint data, to 2020 indicates a clear and statistically significant trend of gradually increasing average footprint (Figure VI-1). The average annual increase in passenger car footprint,

estimated by ordinary least squares, indicates that the passenger car footprints increased by an average of 0.1206 square feet annually over the 2008–2020 period. The estimated average increase is statistically significant at the 0.000001 level, with a 95 percent confidence interval of (0.0929, 0.1483).

**Figure VI-1 – Trend in Passenger Car Footprint, 2008-2020 (Source: EPA 2020 Automotive Trends Report)**

The alternate method for calculating an offset to the MDPCS would be three steps, as follows:

1. Starting from the average footprint of passenger cars in 2020 as reported by EPA, add 0.1206 square feet per year through 2026.

2. Calculate the estimated fuel economy of passenger cars using the average projected footprint numbers calculated in step 1 and the footprint functions that are the passenger car standards for the corresponding model year, which then become “the

Secretary’s projected passenger car fuel economy numbers.”

3. Apply the 92 percent factor to calculate the MDPCS for 2024, 2025, and 2026.

The results of this approach are shown in Table VI-3.

**Table VI-3 – Alternate Approach to Offsetting MDPCS, on Which NHTSA Seeks Comment**

Alternative	MY 2024	MY 2025	MY 2026
No Action	41.6	42.2	42.7
Alternative 1	45.1	46.5	48.0
Alternative 2 (Preferred)	44.6	48.3	52.4
Alternative 3	45.5	50.5	56.0

Comparing all of these, Table VI-4 shows (1) the unadjusted 92 percent MDPCS for MYs 2024–2026, (2) the

proposed 1.9 percent-offset MDPCS for MYs 2024–2026, and (3) the alternate

approach offset MDPCS for MYs 2024–2026.

**Table VI-4 – Comparing the Required mpg Levels for the MDPCS by Regulatory Alternative and Offset Approach**

Alternative	MY 2024	MY 2025	MY 2026
No Action			
Unadjusted 92%	42.2	42.9	43.5
1.9% offset	41.4	42.1	42.7
Alternate approach offset	41.6	42.2	42.7
Alternative 1			
Unadjusted 92%	45.8	47.3	48.9
1.9% offset	44.9	46.5	48.0
Alternate approach offset	45.1	46.5	48.0
Alternative 2 (Preferred)			
Unadjusted 92%	45.2	49.2	53.4
1.9% offset	44.4	48.2	52.4
Alternate approach offset	44.6	48.3	52.4
Alternative 3			
Unadjusted 92%	50.2	55.8	62.0
1.9% offset	45.4	50.4	56.0
Alternate approach offset	45.5	50.5	56.0

**BILLING CODE 4910-59-C**

While the CAFE Model analysis underlying this proposal, the PRIA, and the Draft SEIS does not reflect an offset to the unadjusted 92 percent MDPCS, separate analysis that does reflect the change demonstrates that doing so does not change estimated impacts of any of the regulatory alternatives under consideration, despite the mpg values being slightly different as shown in Table VI-4.

NHTSA seeks comment on the discussion above. To be clear, the agency also seeks comment on whether to apply the MDPCS without any modifier.

**3. Attribute-Based and Defined by a Mathematical Function**

EISA requires NHTSA to set CAFE standards that are “based on 1 or more attributes related to fuel economy and express[ed] . . . in the form of a mathematical function.”<sup>400</sup> Historically, NHTSA has based standards on vehicle footprint, and proposes to continue to do so for the reasons described in

Section III.B of this preamble and Chapter 1 of the accompanying TSD. As in previous rulemakings, NHTSA is proposing to define the standards in the form of a constrained linear function that generally sets higher (more stringent) targets for smaller-footprint vehicles and lower (less stringent) targets for larger-footprint vehicles. These footprint curves are discussed in more detail in Section III.B and TSD Chapter 1. NHTSA seeks comment in Section III.B both on the continued use of footprint as the relevant attribute and on the continued use of the constrained linear curve shapes.

**4. Number of Model Years for Which Standards May Be Set at a Time**

EISA also states that NHTSA shall “issue regulations under this title prescribing average fuel economy standards for at least 1, but not more than 5, model years.”<sup>401</sup> In this NPRM, NHTSA is proposing to set CAFE standards for three model years, MYs

2024–2026. This proposal fits squarely within the plain language of the statute.

**5. Maximum Feasible Standards**

As discussed above, EPCA requires NHTSA to consider four factors in determining what levels of CAFE standards would be maximum feasible. NHTSA presents in the sections below its understanding of the meanings of those four factors.

**(a) Technological Feasibility**

“Technological feasibility” refers to whether a particular method of improving fuel economy is available for deployment in commercial application in the model year for which a standard is being established. Thus, NHTSA is not limited in determining the level of new standards to technology that is already being applied commercially at the time of the rulemaking. For this proposal, NHTSA has considered a wide range of technologies that improve fuel economy, while considering the need to account for which technologies have already been applied to which vehicle model/configuration, as well as the need to estimate realistically the cost and fuel

<sup>400</sup> 49 U.S.C. 32902(b)(3)(A) (2007).

<sup>401</sup> 49 U.S.C. 32902(b)(3)(B) (2007).

economy impacts of each technology as applied to different vehicle models/configurations. NHTSA has not, however, attempted to account for every technology that might conceivably be applied to improve fuel economy, nor does NHTSA believe it is necessary to do so given that many technologies address fuel economy in similar ways.<sup>402</sup>

NHTSA notes that the technological feasibility factor allows NHTSA to set standards that force the development and application of new fuel-efficient technologies, but this factor does not *require* NHTSA to do so.<sup>403</sup> In the 2012 final rule, NHTSA stated that “[i]t is important to remember that technological feasibility must also be balanced with the other of the four statutory factors. Thus, while ‘technological feasibility’ can drive standards higher by assuming the use of technologies that are not yet commercial, ‘maximum feasible’ is also defined in terms of economic practicability, for example, which might caution the agency against basing standards (even fairly distant standards) *entirely* on such technologies.”<sup>404</sup> NHTSA further stated that “. . . as the ‘maximum feasible’ balancing may vary depending on the circumstances at hand for the model year in which the standards are set, the extent to which technological feasibility is simply met or plays a more dynamic role may also shift.”<sup>405</sup> For purposes of this proposal covering standards for MYs 2024–2026, NHTSA is certain that sufficient technology exists to meet the standards—even for the most stringent regulatory alternative. As will be discussed further below, for this proposal, the question is more likely rather, given that the technology exists, how much of it should be required to be added to new cars and trucks in order to conserve more energy, and how to balance that objective against the additional cost of adding that technology.

#### (b) Economic Practicability

“Economic practicability” has consistently referred to whether a standard is one “within the financial capability of the industry, but not so

<sup>402</sup> For example, NHTSA has not considered high-speed flywheels as potential energy storage devices for hybrid vehicles; while such flywheels have been demonstrated in the laboratory and even tested in concept vehicles, commercially-available hybrid vehicles currently known to NHTSA use chemical batteries as energy storage devices, and the agency has considered a range of hybrid vehicle technologies that do so.

<sup>403</sup> See 77 FR at 63015 (Oct. 12, 2012).

<sup>404</sup> *Id.*

<sup>405</sup> *Id.*

stringent as to” lead to “adverse economic consequences, such as a significant loss of jobs or unreasonable elimination of consumer choice.”<sup>406</sup> In evaluating economic practicability, NHTSA considers the uncertainty surrounding future market conditions and consumer demand for fuel economy alongside consumer demand for other vehicle attributes. There is not necessarily a bright-line test for whether a regulatory alternative is economically practicable, but there are several metrics that we discuss below that we find can be useful for making this assessment. In determining whether standards may or may not be economically practicable, NHTSA considers:

*Application rate of technologies*—whether it appears that a regulatory alternative would impose undue burden on manufacturers in either or both the near and long term in terms of how much and which technologies might be required. This metric connects to the next two metrics, as well.

*Other technology-related considerations*—related to the application rate of technologies, whether it appears that the burden on several or more manufacturers might cause them to respond to the standards in ways that compromise, for example, vehicle safety, or other aspects of performance that may be important to consumer acceptance of new products.

*Cost of meeting the standards*—even if the technology exists and it appears that manufacturers can apply it consistent with their product cadence, if meeting the standards will raise per-vehicle cost more than we believe consumers are likely to accept, which could negatively impact sales and employment in this sector, the standards may not be economically practicable. While consumer acceptance of additional new vehicle cost associated with more stringent CAFE standards is uncertain, NHTSA still finds this metric useful for evaluating economic practicability. Elsewhere in this preamble, we seek comment specifically on consumer valuation of fuel economy.

*Sales and employment responses*—as discussed above, sales and employment responses have historically been key to NHTSA’s understanding of economic practicability.

*Uncertainty and consumer acceptance*<sup>407</sup> *of technologies*—considerations not accounted for

<sup>406</sup> 67 FR 77015, 77021 (Dec. 16, 2002).

<sup>407</sup> See, e.g., *Center for Auto Safety v. NHTSA* (CAS), 793 F.2d 1322 (D.C. Cir. 1986) (Administrator’s consideration of market demand as component of economic practicability found to be reasonable).

expressly in our modeling analysis, but important to an assessment of economic practicability given the timeframe of this rulemaking. Consumer acceptance can involve consideration of anticipated consumer responses not just to increased vehicle cost and consumer valuation of fuel economy, but also the way manufacturers may change vehicle models and vehicle sales mix in response to CAFE standards.

Over time, NHTSA has tried different methods to account for economic practicability. Many years ago, prior to the MYs 2005–2007 rulemaking under the non-attribute-based (fixed value) CAFE standards, NHTSA sought to ensure the economic practicability of standards in part by setting them at or near the capability of the “least capable manufacturer” with a significant share of the market, *i.e.*, typically the manufacturer whose fleet mix was, on average, the largest and heaviest, generally having the highest capacity and capability so as not to limit the availability of those types of vehicles to consumers. NHTSA rejected the “least capable manufacturer” approach several rulemakings ago and no longer believes that it is consistent with our root interpretation of economic practicability. Economic practicability focuses on the capability of the *industry* and seeks to avoid adverse consequences such as (*inter alia*) a significant loss of jobs or unreasonable elimination of consumer choice. If the overarching purpose of EPCA is energy conservation, it seems reasonable to expect that maximum feasible standards may be harder for some automakers than for others, and that they need not be keyed to the capabilities of the *least* capable manufacturer.

NHTSA has also sought to account for economic practicability by applying marginal cost-benefit analysis since the first rulemakings establishing attribute-based standards, considering both overall societal impacts and overall consumer impacts. Whether the standards maximize net benefits has thus been a significant, but not dispositive, factor in the past for NHTSA’s consideration of economic practicability. Executive Order 12866, as amended by Executive Order 13563, states that agencies should “select, in choosing among alternative regulatory approaches, those approaches that maximize net benefits . . .” In practice, however, agencies, including NHTSA, must consider that the modeling of net benefits does not capture all considerations relevant to economic practicability. Therefore, as in past rulemakings, NHTSA is considering net societal impacts, net consumer impacts,

and other related elements in the consideration of economic practicability. That said, it is well within the agency's discretion to deviate from the level at which modeled net benefits are maximized if the agency concludes that the level would not represent the maximum feasible level for future CAFE standards. Economic practicability is complex, and like the other factors must be considered in the context of the overall balancing and EPCA's overarching purpose of energy conservation.

(c) The Effect of Other Motor Vehicle Standards of the Government on Fuel Economy

"The effect of other motor vehicle standards of the Government on fuel economy" involves analysis of the effects of compliance with emission, safety, noise, or damageability standards on fuel economy capability and thus on average fuel economy. In many past CAFE rulemakings, NHTSA has said that it considers the adverse effects of other motor vehicle standards on fuel economy. It said so because, from the CAFE program's earliest years<sup>408</sup> until recently, the effects of such compliance on fuel economy capability over the history of the CAFE program have been negative ones. For example, safety standards that have the effect of increasing vehicle weight thereby lower fuel economy capability, thus decreasing the level of average fuel economy that NHTSA can determine to be feasible. NHTSA has also accounted for EPA's "Tier 3" standards for criteria pollutants in its estimates of technology effectiveness in this proposal, and State emissions standards (like California's) that address the tailpipe NO<sub>x</sub>, NMOG, and CO emissions that occur during cold start.<sup>409</sup>

<sup>408</sup> 43 FR 63184, 63188 (Dec. 15, 1977). *See also* 42 FR 33534, 33537 (Jun. 30, 1977).

<sup>409</sup> For most ICE vehicles on the road today, the majority of tailpipe NO<sub>x</sub>, NMOG, and CO emissions occur during "cold start," before the three-way catalyst has reached the very high temperature (e.g., 900–1000 °F) at which point it is able to convert (through oxidation and reduction reactions) those emissions into less harmful derivatives. By limiting the amount of those emissions, tailpipe smog standards require the catalyst to be brought to temperature extremely quickly, so modern vehicles employ cold start strategies that intentionally release fuel energy into the engine exhaust to heat the catalyst to the right temperature as quickly as possible. The additional fuel that must be used to heat the catalyst is typically referred to as a "cold-start penalty," meaning that the vehicle's fuel economy (over a test cycle) is reduced because the fuel consumed to heat the catalyst did not go toward the goal of moving the vehicle forward. The Autonomie work employed to develop technology effectiveness estimates for this proposal accounts for cold-start penalties, as discussed in the Autonomie model documentation.

In other cases, the effect of other motor vehicle standards of the Government may be neutral, or positive. Since the Obama administration, NHTSA has considered the GHG standards set by EPA as "other motor vehicle standards of the Government." In the 2012 final rule, NHTSA stated that "To the extent the GHG standards result in increases in fuel economy, they would do so almost exclusively as a result of inducing manufacturers to install the same types of technologies used by manufacturers in complying with the CAFE standards."<sup>410</sup> NHTSA concluded in 2012 that "no further action was needed" because "the agency had already considered EPA's [action] and the harmonization benefits of the National Program in developing its own [action]."<sup>411</sup> In the 2020 final rule, NHTSA reinforced that conclusion by explaining that a textual analysis of the statutory language made it clear that EPA's CO<sub>2</sub> standards applicable to light-duty vehicles are literally "other motor vehicle standards of the Government," because they are standards set by a Federal agency that apply to motor vehicles. NHTSA and EPA are obligated by Congress to exercise their own independent judgment in fulfilling their statutory missions, even though both agencies' regulations affect both fuel economy and CO<sub>2</sub> emissions. There are differences between the two agencies' programs that make NHTSA's CAFE standards and EPA's GHG standards not perfectly one-to-one (even besides the fact that EPA regulates other GHGs besides CO<sub>2</sub>, EPA's CO<sub>2</sub> standards also differ from NHTSA's in a variety of ways, often because NHTSA is bound by statute to a certain aspect of CAFE regulation). NHTSA endeavors to create standards that meet our statutory obligations and still avoid requiring manufacturers to build multiple fleets of vehicles for the U.S. market.<sup>412</sup> As in 2020, NHTSA has continued to do all of these things with this proposal.

Similarly, NHTSA has considered and accounted for California's ZEV mandate (and its adoption by the other Section 177 states) in developing the baseline for this proposal. As discussed above, NHTSA has not expressly accounted for California's GHG standards for the model years subject to this rulemaking in the baseline analysis for this proposal,<sup>413</sup> but seeks comment on this

<sup>410</sup> 77 FR 62624, 62669 (Oct. 15, 2012).

<sup>411</sup> *Id.*

<sup>412</sup> *Massachusetts v. EPA*, 549 U.S. 497, 532 (2007) ("[T]here is no reason to think that the two agencies cannot both administer their obligations and yet avoid inconsistency.")

<sup>413</sup> As discussed elsewhere, however, NHTSA has sought to account in the baseline for the California

approach for the final rule. NHTSA notes again that no final decision has yet been made on the CAA waiver for California.

(d) The Need of the U.S. To Conserve Energy

NHTSA has consistently interpreted "the need of the United States to conserve energy" to mean "the consumer cost, national balance of payments, environmental, and foreign policy implications of our need for large quantities of petroleum, especially imported petroleum."<sup>414</sup>

(1) Consumer Costs and Fuel Prices

Fuel for vehicles costs money for vehicle owners and operators, so all else equal, consumers benefit from vehicles that need less fuel to perform the same amount of work. Future fuel prices are a critical input into the economic analysis of potential CAFE standards because they determine the value of fuel savings both to new vehicle buyers and to society; the amount of fuel economy that the new vehicle market is likely to demand in the absence of regulatory action; and they inform NHTSA about the "consumer cost . . . of our need for large quantities of petroleum." For this proposal, NHTSA relied on fuel price projections from the U.S. Energy Information Administration's (EIA) Annual Energy Outlook (AEO) for 2021. Federal government agencies generally use EIA's price projections in their assessment of future energy-related policies.

In previous CAFE rulemakings, discussions of fuel prices have always been intended to reflect the price of motor gasoline. However, a growing set of vehicle offerings that rely in part, or entirely, on electricity suggests that gasoline prices are no longer the only fuel prices relevant to evaluations of proposed CAFE standards. In the analysis supporting this proposal, NHTSA considers the energy consumption and resulting emissions from the entire on-road fleet, which already contains a number of plug-in hybrid and fully electric vehicles. Higher CAFE standards encourage manufacturers to improve fuel economy; concurrently, manufacturers will foreseeably seek to continue to maximize profit (or minimize compliance cost), and some reliance on electrification is a viable strategy for some manufacturers, even though NHTSA does not consider it in determining maximum feasible CAFE

Framework Agreement with BMW, Ford, Honda, VWA, and Volvo.

<sup>414</sup> 42 FR 63184, 63188 (Dec. 15, 1977).

stringency. Under the more stringent CAFE alternatives in this proposal, we see a greater reliance on electrification technologies in the analysis in the years following the explicitly-regulated model years, even though internal combustion engines continue to be the most common powertrain across the industry in the action years of this proposal.

While the current national average electricity price is significantly higher than that of gasoline, on an energy equivalent basis (\$/MMBtu),<sup>415</sup> electric motors convert energy into propulsion much more efficiently than internal combustion engines. This means that, even though the energy-equivalent prices of electricity are higher, electric vehicles still produce fuel savings for their owners. EIA also projects rising real gasoline prices over the next three decades, while projecting real electricity prices to remain relatively flat. As the reliance on electricity grows in the light-duty fleet, NHTSA will continue to monitor the trends in electricity prices and their implications for CAFE standards. Even if NHTSA is prohibited from considering electrification as a technology during the model years covered by the rulemaking, the consumer (and social) cost implications of manufacturers otherwise switching to electrification may remain relevant to the agency's considerations.

For now, gasoline is still the dominant fuel used in light-duty transportation. As such, consumers, and the economy more broadly, are subject to fluctuations in price that impact the cost of travel and, consequently, the demand for mobility. Over the last decade, the U.S. has become a stabilizing force in the global oil market and our reliance on imported petroleum has decreased steadily. The most recent Annual Energy Outlook, AEO 2021, projects the U.S. to be a net exporter of petroleum and other liquids through 2050 in the Reference Case. Over the last decade, EIA projections of real fuel prices have generally flattened in recognition of the changing dynamics of the oil market and slower demand growth, both in the U.S. and in developing markets. For example, the International Energy Agency projects that global demand for gasoline is unlikely to ever return to its 2019 level (before the pandemic).<sup>416</sup> However, vehicles are long-lived assets and the long-term price uncertainty of petroleum still represents a risk to consumers, albeit one that has

decreased in the last decade. Continuing to reduce the amount of money consumers spend on vehicle fuel thus remains an important consideration for the need of the U.S. to conserve energy.

## (2) National Balance of Payments

NHTSA has consistently included consideration of the "national balance of payments" as part of the need of the U.S. to conserve energy because of concerns that importing large amounts of oil created a significant wealth transfer to oil-exporting countries and left the U.S. economically vulnerable.<sup>417</sup> As recently as 2009, nearly half the U.S. trade deficit was driven by petroleum,<sup>418</sup> yet this concern has been less critical in more recent CAFE actions, in part because other factors besides petroleum consumption have been playing a bigger role in the U.S. trade deficit.<sup>419</sup> While transportation demand is expected to increase as the economy recovers from the pandemic, it is foreseeable that the trend of trade in consumer goods and services continuing to dominate the national balance of payments, as compared to petroleum, will continue during the rulemaking timeframe.

That said, the U.S. continues to rely on oil imports, and NHTSA continues to recognize that reducing the vulnerability of the U.S. to possible oil price shocks remains important. This proposal aims to improve fleet-wide fuel efficiency and to help reduce the amount of petroleum consumed in the U.S., and therefore aims to improve this part of the U.S. balance of payments.

<sup>417</sup> For the earliest discussion of this topic, see 42 FR 63184, 63192 (Dec. 15, 1977) ("A major reason for this need [to reduce petroleum consumption] is that the importation of large quantities of petroleum creates serious balance of payments and foreign policy problems. The United States currently spends approximately \$45 billion annually for imported petroleum. But for this large expenditure, the current large U.S. trade deficit would be a surplus.").

<sup>418</sup> See, *Today in Energy: Recent improvements in petroleum trade balance mitigate U.S. trade deficit*, U.S. Energy Information Administration (July 21, 2014). Available at <https://www.eia.gov/todayinenergy/detail.php?id=17191> and in the docket for this rulemaking, NHTSA-2021-0053.

<sup>419</sup> Consumer products are the primary drivers of the trade deficit. In 2020, the U.S. imported \$2.4 trillion in consumer goods, versus \$116.4 billion of petroleum, which is the lowest amount since 2002. The 2020 goods deficit of \$904.9 billion was the highest on record, while the 2020 petroleum surplus of \$18.1 billion was the first annual surplus on record. See U.S. Census Bureau, "Annual 2020 Press Highlights," at [census.gov/foreign-trade/statistics/highlights/AnnualPressHighlights.pdf](https://www.census.gov/foreign-trade/statistics/highlights/AnnualPressHighlights.pdf), and available in the docket for this rulemaking. While 2020 was an unusual year for U.S. transportation demand, given the global pandemic, this is consistent with existing trends in which consumer products imports significantly outweigh oil imports.

## (3) Environmental Implications

Higher fleet fuel economy reduces U.S. emissions of CO<sub>2</sub> as well as various other pollutants by reducing the amount of oil that is produced and refined for the U.S. vehicle fleet, but can also potentially increase emissions by reducing the cost of driving, which can result in increased vehicle miles traveled (*i.e.*, the rebound effect). Thus, the net effect of more stringent CAFE standards on emissions of each pollutant depends on the relative magnitudes of its reduced emissions in fuel refining and distribution and increases in its emissions from vehicle use. Fuel savings from CAFE standards also necessarily result in lower emissions of CO<sub>2</sub>, the main greenhouse gas emitted as a result of refining, distribution, and use of transportation fuels.

NHTSA has considered environmental issues, both within the context of EPCA and the context of the National Environmental Policy Act (NEPA), in making decisions about the setting of standards since the earliest days of the CAFE program. As courts of appeal have noted in three decisions stretching over the last 20 years,<sup>420</sup> NHTSA defined "the need of the United States to conserve energy" in the late 1970s as including, among other things, environmental implications. In 1988, NHTSA included climate change concepts in its CAFE NPRMs and prepared its first environmental assessment addressing that subject.<sup>421</sup> It cited concerns about climate change as one of the reasons for limiting the extent of its reduction of the CAFE standard for MY 1989 passenger cars.<sup>422</sup>

NHTSA also considers environmental justice issues as part of the environmental considerations under the need of the U.S. to conserve energy, per Executive Order 12898, "Federal Actions to Address Environmental Justice in Minority Populations" <sup>423</sup> and DOT Order 5610.2(c), "U.S. Department of Transportation Actions to Address Environmental Justice in Minority Populations and Low-Income Populations." <sup>424</sup> The affected environment for environmental justice is nationwide, with a focus on areas that

<sup>416</sup> International Energy Agency, Oil 2021, (p. 30), [https://iea.blob.core.windows.net/assets/1fa45234-bac5-4d89-a532-768960f99d07/Oil\\_2021-PDF.pdf](https://iea.blob.core.windows.net/assets/1fa45234-bac5-4d89-a532-768960f99d07/Oil_2021-PDF.pdf).

could contain minority and low-income communities who would most likely be exposed to the environmental and health effects of oil production, distribution, and consumption, or the impacts of climate change. This includes areas where oil production and refining occur, areas near roadways, coastal flood-prone areas, and urban areas that are subject to the heat island effect.

Numerous studies have found that some environmental hazards are more prevalent in areas where minority and low-income populations represent a higher proportion of the population compared with the general population. In terms of effects due to criteria pollutants and air toxics emissions, the body of scientific literature points to disproportionate representation of minority and low-income populations in proximity to a range of industrial, manufacturing, and hazardous waste facilities that are stationary sources of air pollution, although results of individual studies may vary. While the scientific literature specific to oil refineries is limited, disproportionate exposure of minority and low-income populations to air pollution from oil refineries is suggested by other broader studies of racial and socioeconomic disparities in proximity to industrial facilities generally. Studies have also consistently demonstrated a disproportionate prevalence of minority and low-income populations that are living near mobile sources of pollutants (such as roadways) and therefore are exposed to higher concentrations of criteria air pollutants in multiple locations across the United States. Lower-positioned socioeconomic groups are also differentially exposed to air pollution and differentially vulnerable to effects of exposure.

In terms of exposure to climate change risks, the literature suggests that across all climate risks, low-income communities, some communities of color, and those facing discrimination are disproportionately affected by climate events. Communities overburdened by poor environmental quality experience increased climate risk due to a combination of sensitivity and exposure. Urban populations experiencing inequities and health issues have greater susceptibility to climate change, including substantial temperature increases. Some communities of color facing cumulative exposure to multiple pollutants also live in areas prone to climate risk. Indigenous peoples in the United States face increased health disparities that cause increased sensitivity to extreme heat and air pollution. Together, this

information indicates that climate impacts disproportionately affect minority and low-income populations because of socioeconomic circumstances, histories of discrimination, and inequity. Furthermore, high temperatures can exacerbate poor air quality, further compounding the risk to overburdened communities. Finally, health-related sensitivities in low-income and minority populations increase risk of damaging impacts from poor air quality under climate change, underscoring the potential benefits of improving air quality to communities overburdened by poor environmental quality.

In the SEIS, Chapters 3, 4, 5, and 8 discuss the connections between oil production, distribution, and consumption, and their health and environmental impacts.

All of the action alternatives considered in this proposal reduce carbon dioxide emissions and, thus, the effects of climate change, as compared to the baseline. Effects on criteria pollutants and air toxics emissions are somewhat more complicated, for a variety of reasons, as discussed in Section VI.C, although over time and certainly over the lifetimes of the vehicles that would be subject to this proposal, these emissions are currently forecast to fall significantly.

As discussed above, while the majority of light-duty vehicles will continue to be powered by internal combustion engines in the near- to mid-term under all regulatory alternatives, the more stringent alternatives do appear in the analysis to lead to greater electrification in the mid- to longer-term. While NHTSA is prohibited from considering electric vehicles in determining maximum feasible CAFE levels, electric vehicles (which appear both in the agency's baseline and which may be produced in model years following the period of regulation as an indirect effect of more stringent standards, or in response to other standards or to market demand) produce few to zero tailpipe emissions, and thus contribute meaningfully to the decarbonization of the transportation sector, in addition to having environmental, health, and economic development benefits, although these benefits may not yet be equally distributed across society. They also present new environmental (and social) questions, like those associated with reduced tailpipe emissions, upstream electricity production, minerals extraction for battery components, and ability to charge an electric vehicle. The upstream environmental effects of extraction and refining for petroleum

are well-recognized; minerals extraction and refining can also have significant downsides. As one example of documentation of these effects, the United Nations Conference on Trade and Development issued a report in July 2020 describing acid mine drainage and uranium-laced dust associated with cobalt mines in the DRC, along with child labor concerns; considerable groundwater consumption and dust issues that harm miners and indigenous communities in the Andes; issues with fine particulate matter causing human health effects and soil contamination in regions near graphite mines; and so forth.<sup>425</sup> NHTSA's SEIS discusses these and other effects (such as production and end-of-life issues) in more detail, and NHTSA will continue to monitor these issues going forward insofar as CAFE standards may increase electrification levels even if NHTSA does not expressly consider electrification in setting those standards, because NHTSA does not control what technologies manufacturers use to meet those standards, and because NHTSA is required to consider the environmental effects of its standards under NEPA.

NHTSA carefully considered the environmental effects of this proposal, both quantitative and qualitative, as discussed in the SEIS and in Sections VI.C and VI.D.

#### (4) Foreign Policy Implications

U.S. consumption and imports of petroleum products impose costs on the domestic economy that are not reflected in the market price for crude petroleum or in the prices paid by consumers for petroleum products such as gasoline. These costs include (1) higher prices for petroleum products resulting from the effect of U.S. oil demand on world oil prices; (2) the risk of disruptions to the U.S. economy caused by sudden increases in the global price of oil and its resulting impact of fuel prices faced by U.S. consumers, and (3) expenses for maintaining the strategic petroleum reserve (SPR) to provide a response option should a disruption in commercial oil supplies threaten the U.S. economy, to allow the U.S. to meet part of its International Energy Agency obligation to maintain emergency oil stocks, and to provide a national defense fuel reserve. Reducing U.S. consumption of crude oil or refined petroleum products (by reducing motor

<sup>425</sup> UNCTAD, "Commodities at a Glance: Special issue on strategic battery raw materials," No. 13, Geneva, 2020, at 46. Available at [https://unctad.org/system/files/official-document/ditccom2019d5\\_en.pdf](https://unctad.org/system/files/official-document/ditccom2019d5_en.pdf) and in the docket for this rulemaking, NHTSA-2021-0053.

fuel use) can reduce these external costs.<sup>426</sup>

Stephen Brown, who has published extensively on price shock and foreign policy risks associated with U.S. oil consumption, stated in a recent paper that:

Over the past few years, world oil market conditions have changed considerably (with the United States importing much less oil), new estimates of the probabilities of world oil supply disruptions have become available, and new estimates of the response of U.S. real GDP to oil supply shocks and the short-run elasticity of oil demand have become available. These developments suggest that it is time to update the estimates of the security costs of U.S. oil consumption. The new estimates of the oil security premiums suggest that U.S. oil security may have become less of an issue than it was in the past, mostly as a result of new estimates of the short-run elasticity of demand and the response of U.S. real GDP to oil price shocks.<sup>427</sup>

<sup>426</sup> A 2006 report by the Council on Foreign Relations identified six foreign policy costs that it said arose from U.S. consumption of imported oil. These costs include (1) the adverse effect that significant disruptions in oil supply will have for political and economic conditions in the U.S. and other importing countries; (2) the fears that the current international system is unable to ensure secure oil supplies when oil is seemingly scarce and oil prices are high; (3) political realignment from dependence on imported oil that limits U.S. alliances and partnerships; (4) the flexibility that oil revenues give oil-exporting countries to adopt policies that are contrary to U.S. interests and values; (5) an undermining of sound governance by the revenues from oil and gas exports in oil-exporting countries; and (6) an increased U.S. military presence in the Middle East that results from the strategic interest associated with oil consumption. Council on Foreign Relations, National Security Consequences of U.S. Oil Dependency, Independent Task Force Report No. 58, October 2006. Available at [https://cdn.cfr.org/sites/default/files/report\\_pdf/0876093659.pdf](https://cdn.cfr.org/sites/default/files/report_pdf/0876093659.pdf) and in the docket for this rulemaking, NHTSA–2021–0053. Brown and Huntington (2015) find that these six costs are either implicitly incorporated in the welfare-theoretic analysis, are not externalities, or cannot be quantified. Brown, Stephen and Hillard Huntington, Evaluating U.S. oil security and import reliance, *Energy Policy* 108, 2015, at 512–523. Available at <https://www.sciencedirect.com/science/article/abs/pii/S0301421515000026> and for hard copy review at DOT headquarters. To the extent that these costs are externalities that cannot be quantified, the measured security costs of U.S. reliance on imported oil will be understated.

<sup>427</sup> Brown, Stephen. “New Estimates of the security costs of U.S. oil consumption,” *Energy Policy*, Vol. 113, Feb. 2018, at 172. Available at <https://www.sciencedirect.com/science/article/abs/>

Brown notes that “Because we have not observed a modern economy with large oil supply disruptions, we have no reliable method to quantify the effects of these disruptions,” and “The result could be an average of old and new results or estimation problems and a poor fit.”<sup>428</sup> Geopolitical risk can still affect global oil prices, of course, because oil is a global market, and thus can affect U.S. oil prices, although possibly by less than in the past.<sup>429</sup> The U.S. still maintains a military presence in certain parts of the world to help secure global access to petroleum supplies. Chapter 6.2.4 of the TSD discusses this topic in more detail. Brown concludes that:

Nonetheless, only the highest estimates of the oil security premiums suggest that U.S. oil security is nearly an equally important issue to the environmental costs of oil use. The mid-estimates from the model that may best represent how the world oil market and the U.S. economy will respond to world oil supply disruptions of various sizes . . . find U.S. consumption of imported or domestic oil does yield important security costs, but those costs are much lower than the estimated environmental costs of oil use. Consistent with Brown and Huntington (2013), the substitution of domestic oil for imported oil only slightly improves U.S. oil security. Oil conservation is more effective

[pii/S0301421517307413](https://www.federalregister.gov/doc/50301421517307413) and for hard copy review at DOT headquarters.

<sup>428</sup> *Id.* at 181.

<sup>429</sup> Also in 2018, Beccue, Huntington, Leiby, and Vincent reported on their findings of an expert panel on oil market disruption risks and likelihoods, and stated that based on these findings, during the period of 2016–2025, “It is very likely that a disruption greater than 2 MMBD will occur (81%). However, it is unlikely that disruptions greater than 15 MMBD will occur (1%).” They further state that “. . . experts in the current study expect that both gross shocks and excess capacity will be lower than before, resulting in similar net disruptions [to what was estimated in 2005]. Although turmoil remains high in these countries with the ongoing Iraq war, tensions between Iran and its Arab neighbors, and concern over the ability of terrorists to cut oil supply facilities, these conditions do not produce larger oil market disruptions.” They conclude that “In general, this panel of energy security experts has concluded that current world events and energy markets have increased the likelihood of oil disruptions since 1996 but demonstrated a similar risk profile compared to the 2005 period. Moreover, their assessments indicate that lower oil price paths make net disruptions of any given size more likely.” Beccue *et al.*, “An updated assessment of oil market disruption risks,” *Energy Policy*, Vol. 115, Apr. 2018, at 456. Available at <https://www.sciencedirect.com/science/article/abs/pii/S0301421517308285> and for hard copy review at DOT headquarters.

than increased domestic oil production at improving U.S. oil security.<sup>430</sup>

NHTSA agrees both that oil conservation improves U.S. oil security, and that the environmental costs of oil use are intertwined with the security costs of oil use in some ways as climate change destabilizes traditional geopolitical power structures over time. The effect of climate change on natural resources inevitably has security implications—population changes and shifts have already been forced in some countries, which can create social and security effects at all geopolitical levels—local, national, regional, and global. CAFE standards over the last few decades have conserved significant quantities of oil, and the petroleum intensity of the U.S. fleet has decreased significantly. Continuing to improve energy conservation and reduce U.S. oil consumption by raising CAFE standards further has the potential to continue to help with all of these considerations.

As standards and market demand move the U.S. light-duty vehicle fleet toward electrification, different potential foreign policy implications arise. Most vehicle electrification is enabled by lithium-ion batteries. Lithium-ion battery global value chains have several phases: Sourcing (mining/extraction); processing/refining; cell manufacturing; battery manufacturing; installation in an EV; and recycling.<sup>431</sup> Because lithium-ion battery materials have a wide global diversity of origin, accessing them can pose varying geopolitical challenges.<sup>432</sup> The U.S. International Trade Commission (USITC) recently summarized 2018 data from the U.S. Geological Survey on the production/sourcing of the four key lithium-ion battery materials, as shown in Table VI–5.

<sup>430</sup> Brown, 2018, at 182.

<sup>431</sup> Scott, Sarah, and Robert Ireland, “Lithium-Ion Battery Materials for Electric Vehicles and their Global Value Chains,” Office of Industries Working Paper ID–068, U.S. International Trade Commission, June 2020, at 7. Available at [https://www.usitc.gov/publications/332/working\\_papers/gvc\\_overview\\_scott\\_ireland\\_508\\_final\\_061120.pdf](https://www.usitc.gov/publications/332/working_papers/gvc_overview_scott_ireland_508_final_061120.pdf) and in the docket for this rulemaking, NHTSA–2021–0053.

<sup>432</sup> *Id.* at 8.

Table VI-5 – Lithium-ion Battery Materials Mining Production, 2018<sup>433</sup>

Lithium-ion Battery Material Ores and Concentrates	Countries with Largest Mining Production (Share of Global Total)	U.S. Mining Production (Share of Global Total)
Lithium	Australia (60 percent), Chile (19 percent), China (9 percent), Argentina (7 percent)	USITC staff estimates less than 1 percent
Cobalt	Democratic Republic of Congo (64 percent), Cuba (4 percent), Russia (4 percent), Australia (3 percent)	Less than 0.5 percent
Graphite (natural)	China (68 percent), Brazil (10 percent), India (4 percent)	0 percent
Nickel	Indonesia (24 percent), Philippines (15 percent), Russia (9 percent)	Less than 1 percent

Of these sources, the USITC notes that while “lithium has generally not faced political instability risks,” “Because of the [Democratic Republic of Congo’s] ongoing political instability, as well as poor labor conditions, sourcing cobalt faces significant geopolitical challenges.”<sup>434</sup> Nickel is also used extensively in stainless steel production, and much of what is produced in Indonesia and the Philippines is exported to China for stainless steel manufacturing.<sup>435</sup> Obtaining graphite for batteries does not currently pose geopolitical obstacles, but the USITC notes that Turkey has great potential to become a large graphite producer, which would make stability there a larger concern.<sup>436</sup>

For materials processing and refining, China is the largest importer of unprocessed lithium, which it then transforms into processed or refined lithium,<sup>437</sup> the leading producer of refined cobalt (with Finland a distant second),<sup>438</sup> one of the leading producers of primary nickel products (along with Indonesia, Japan, Russia, and Canada) and one of the leading refiners of nickel into nickel sulfate, the chemical compound used for cathodes in lithium-ion batteries,<sup>439</sup> and one of the leading processors of graphite intended for use in lithium-ion batteries as well.<sup>440</sup> In all regions, increasing attention is being given to vertical integration in the lithium-ion battery industry from

material extraction, mining and refining, battery materials, cell production, battery systems, reuse, and recycling. The United States is lagging in upstream capacity; although the U.S. has some domestic lithium deposits, it has very little capacity in mining and refining any of the key raw materials. As mentioned elsewhere, however, there can be benefits and drawbacks in terms of environmental consequences associated with increased mining, refining, and battery production.

China and the European Union (EU) are also major consumers of lithium-ion batteries, along with Japan, Korea, and others. Lithium-ion batteries are used not only in light-duty vehicles, but in many ubiquitous consumer goods, and are likely to be used eventually in other forms of transportation as well. Thus, securing sufficient batteries to enable large-scale shifts to electrification in the U.S. light-duty vehicle fleet may face new issues as vehicle companies compete with other new sectors. NHTSA will continue to monitor these issues going forward.

President Biden has already issued an Executive Order on “America’s Supply Chains,” aiming to strengthen the resilience of America’s supply chains, including those for automotive batteries.<sup>441</sup> Reports are to be developed within one year of issuance of the Executive Order, and NHTSA will monitor these findings as they develop.

#### (e) Factors That NHTSA Is Prohibited From Considering

EPCA also provides that in determining the level at which it should set CAFE standards for a particular

model year, NHTSA may not consider the ability of manufacturers to take advantage of several EPCA provisions that facilitate compliance with CAFE standards and thereby reduce the costs of compliance.<sup>442</sup> NHTSA cannot consider compliance credits that manufacturers earn by exceeding the CAFE standards and then use to achieve compliance in years in which their measured average fuel economy falls below the standards. NHTSA also cannot consider the use of alternative fuels by dual fueled automobiles, nor the fuel economy (*i.e.*, the availability) of dedicated alternative fueled automobiles—including battery-electric vehicles—in any model year. EPCA encourages the production of alternative fuel vehicles by specifying that their fuel economy is to be determined using a special calculation procedure that results in those vehicles being assigned a higher equivalent fuel economy level than they actually achieve.

The effect of the prohibitions against considering these statutory flexibilities in setting the CAFE standards is that the flexibilities remain voluntarily-employed measures. If NHTSA were instead to assume manufacturer use of those flexibilities in setting new standards (as NHTSA does in the “EIS analysis,” but not the “standard setting analysis”), compliance with higher standards would appear more cost-effective and, potentially, more feasible, which would thus effectively require manufacturers to use those flexibilities if NHTSA determined that standards should be more stringent. By keeping NHTSA from including them in our stringency determination, the provision ensures that those statutory credits

<sup>433</sup> *Id.*, citing U.S. Geological Survey, Mineral Commodity Summaries, Feb. 2019.

<sup>439</sup> *Id.*

<sup>440</sup> *Id.*

<sup>441</sup> Executive Order 14017, “America’s Supply Chains,” Feb. 24, 2021. 86 FR 11849 (Mar. 1, 2021).

<sup>442</sup> 49 U.S.C. 32902(h).

remain true compliance flexibilities. However, the flip side of the effect described above is that preventing NHTSA from assuming use of dedicated alternative fuel vehicles for compliance makes it more difficult for the CAFE program to facilitate a complete transition of the U.S. light-duty fleet to full electrification.

In contrast, for the non-statutory fuel economy improvement value program that NHTSA developed by regulation, NHTSA does not consider these fuel economy adjustments subject to the 32902(h) prohibition on considering flexibilities. The statute is very clear as to which flexibilities are not to be considered. When the agency has introduced additional flexibilities such as A/C efficiency and “off-cycle” technology fuel improvement values, NHTSA has considered those technologies as available in the analysis. Thus, this analysis includes assumptions about manufacturers’ use of those technologies, as detailed in Chapter 3.8 of the accompanying TSD.

NHTSA notes that one of the recommendations in the 2021 NAS Report was for Congress to “amend the statute to delete the [32902(h)] prohibition on considering the fuel economy of dedicated alternative fueled vehicles in setting CAFE standards.”<sup>443</sup> Recognizing that changing statutory text is Congress’ affair and not NHTSA’s, the committee further recommended that if Congress does not change the statute, NHTSA should consider adding another attribute to the fuel economy standard function, like “the expected market share of ZEVs in the total U.S. fleet of new light-duty vehicles—such that the standards increase as the share of ZEVs in the total U.S. fleet increases.”<sup>444</sup> NHTSA discusses this recommendation further in Section III.B.

While NHTSA does not consider the prohibited items in its standard-setting analysis or for making its tentative decision about what levels of standards would be maximum feasible, NHTSA notes that it is informed by the “EIS” analysis presented in the PRIA. The EIS analysis does not contain these restrictions, and therefore accounts for credit availability and usage, and manufacturers’ ability to employ alternative fueled vehicles, for purpose of conformance with E.O. 12866 and NEPA regulations. Under the EIS analysis, compliance generally appears less costly. For example, this EIS analysis shows manufacturers’ costs averaging about \$1,070 in MY 2029

under the proposed standards, as compared to the \$1,175 shown by the standard setting analysis. Again, however, for purposes of tentatively determining maximum feasible CAFE levels, NHTSA considers only the standard setting analysis shown in the NPRM, consistent with Congress’ direction.

#### (f) Other Considerations in Determining Maximum Feasible CAFE Standards

NHTSA has historically considered the potential for adverse safety effects in setting CAFE standards. This practice has been upheld in case law.<sup>445</sup> In this proposal, NHTSA has considered the safety effects discussed in Section V of this preamble and in Chapter 5 of the accompanying PRIA. NHTSA discusses its consideration of these effects in Section VI.D.

#### B. Administrative Procedure Act

The Administrative Procedure Act governs agency rulemaking generally and provides the standard of judicial review for agency actions. To be upheld under the “arbitrary and capricious” standard of judicial review under the APA, an agency rule must be rational, based on consideration of the relevant factors, and within the scope of the authority delegated to the agency by statute. The agency must examine the relevant data and articulate a satisfactory explanation for its action including a “rational connection between the facts found and the choice made.”<sup>446</sup>

Statutory interpretations included in an agency’s rule are subject to the two-step analysis of *Chevron, U.S.A. v. Natural Resources Defense Council*.<sup>447</sup> Under step one, where a statute “has directly spoken to the precise question at issue,” *id.* at 842, the court and the agency “must give effect to the

unambiguously expressed intent of Congress.”<sup>448</sup> If the statute is silent or ambiguous regarding the specific question, the court proceeds to step two and asks “whether the agency’s answer is based on a permissible construction of the statute.”<sup>449</sup> The APA also requires that agencies provide notice and comment to the public when proposing regulations,<sup>450</sup> as NHTSA is doing in this proposal.

NHTSA recognizes that this proposal, like the 2020 final rule, is reconsidering standards previously promulgated. NHTSA, like any other Federal agency, is afforded an opportunity to reconsider prior views and, when warranted, to adopt new positions. Indeed, as a matter of good governance, agencies *should* revisit their positions when appropriate, especially to ensure that their actions and regulations reflect legally sound interpretations of the agency’s authority and remain consistent with the agency’s views and practices. As a matter of law, “an Agency is entitled to change its interpretation of a statute.”<sup>451</sup>

Nonetheless, “[w]hen an Agency adopts a materially changed interpretation of a statute, it must in addition provide a ‘reasoned analysis’ supporting its decision to revise its interpretation.”<sup>452</sup>

“Changing policy does not, on its own, trigger an especially ‘demanding burden of justification.’”<sup>453</sup> Providing a reasoned explanation “would ordinarily demand that [the Agency] display awareness that it *is* changing position.”<sup>454</sup> Beyond that, however, “[w]hen an agency changes its existing position, it ‘need not always provide a more detailed justification than what would suffice for a new policy created on a blank slate.’”<sup>455</sup> While the agency “must show that there are good reasons for the new policy,” the agency “need not demonstrate to a court’s satisfaction that the reasons for the new policy are

<sup>443</sup> 2021 NAS Report, Summary Recommendation 5.

<sup>444</sup> *Id.*

<sup>445</sup> As courts have recognized, “NHTSA has always examined the safety consequences of the CAFE standards in its overall consideration of relevant factors since its earliest rulemaking under the CAFE program.” *Competitive Enterprise Institute v. NHTSA*, 901 F.2d 107, 120 n. 11 (D.C. Cir. 1990) (“CEI-I”) (citing 42 FR 33534, 33551 (Jun. 30, 1977)). Courts have consistently upheld NHTSA’s implementation of EPCA in this manner. See, e.g., *Competitive Enterprise Institute v. NHTSA*, 956 F. 2d 321, 322 (D.C. Cir. 1992) (“CEI-II”) (in determining the maximum feasible standard, “NHTSA has always taken passenger safety into account) (citing CEI-I, 901 F.2d at 120 n. 11); *Competitive Enterprise Institute v. NHTSA*, 45 F.3d 481, 482–83 (D.C. Cir. 1995) (CEI-III) (same); *Center for Biological Diversity v. NHTSA*, 538 F.3d 1172, 1203–04 (9th Cir. 2008) (upholding NHTSA’s analysis of vehicle safety issues associated with weight in connection with the MYs 2008–2011 light truck CAFE rulemaking).

<sup>446</sup> *Burlington Truck Lines, Inc. v. United States*, 371 U.S. 156, 168 (1962).

<sup>447</sup> 467 U.S. 837 (1984).

*better* than the reasons for the old one.”<sup>456</sup> “[I]t suffices that the new policy is permissible under the statute, that there are good reasons for it, and that the Agency *believes* it to be better, which the conscious change of course adequately indicates.”<sup>457</sup> For instance, “evolving notions” about the appropriate balance of varying policy considerations constitute sufficiently good reasons for a change in position.<sup>458</sup> Moreover, it is “well within an Agency’s discretion” to change policy course even when no new facts have arisen: Agencies are permitted to conduct a “reevaluation of which policy would be better in light of the facts,” without “rely[ing] on new facts.”<sup>459</sup>

To be sure, providing “a more detailed justification” is appropriate in some cases. “Sometimes [the agency] must [provide a more detailed justification than what would suffice for a new policy created on a blank slate]—when, for example, its new policy rests upon factual findings that contradict those which underlay its prior policy; or when its prior policy has engendered serious reliance interests that must be taken into account.”<sup>460</sup> This preamble, and the accompanying TSD and PRIA, all provide extensive detail on the agency’s updated analysis, and Section VI.D contains the agency’s explanation of how the agency has considered that analysis and other relevant information in tentatively determining that the proposed CAFE standards are maximum feasible for MYs 2024–2026 passenger cars and light trucks.

### C. National Environmental Policy Act

As discussed above, EPCA requires NHTSA to determine the level at which to set CAFE standards for each model year by considering the four factors of technological feasibility, economic practicability, the effect of other motor vehicle standards of the Government on fuel economy, and the need of the United States to conserve energy. The National Environmental Policy Act (NEPA) directs that environmental considerations be integrated into that process.<sup>461</sup> To explore the potential environmental consequences of this

rulemaking action, NHTSA has prepared a Supplemental Environmental Impact Statement (“SEIS”) for this proposal.<sup>462</sup> The purpose of an EIS is to “provide full and fair discussion of significant environmental impacts and [to] inform decisionmakers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment.”<sup>463</sup>

When preparing an EIS, NEPA requires an agency to compare the potential environmental impacts of its proposed action and a reasonable range of alternatives. In the SEIS, NHTSA analyzed a No Action Alternative and three action alternatives. The alternatives represent a range of potential actions the agency could take, and they are described more fully in Section IV of this preamble, Chapter 1 of the TSD, and Chapter 2 of the PRIA. The environmental impacts of these alternatives, in turn, represent a range of potential environmental impacts that could result from NHTSA’s setting maximum feasible fuel economy standards for passenger cars and light trucks.

To derive the direct and indirect impacts of the action alternatives, NHTSA compared each action alternative to the No Action Alternative, which reflects baseline trends that would be expected in the absence of any further regulatory action. More specifically, the No Action Alternative in the SEIS assumed that the CAFE standards set in the 2020 final rule for MYs 2021–2026 passenger cars and light trucks would remain in effect. In addition, the No Action Alternative also includes several other actions that NHTSA believes will occur in the absence of further regulatory action, as discussed in more detail in Section IV above: (1) California’s ZEV mandate; (2) the “Framework Agreements” between California and BMW, Ford, Honda, VWA, and Volvo, which NHTSA implemented by including EPA’s baseline GHG standards (*i.e.*, those set in the 2020 final rule) and introducing more stringent GHG target functions for those manufacturers; and (3) the assumption that manufacturers will also make any additional fuel economy improvements estimated to reduce owners’ estimated average fuel outlays during the first 30 months of vehicle operation by more than the estimated

increase in new vehicle price. The No Action Alternative provides a baseline against which to compare the environmental impacts of other alternatives presented in the SEIS.<sup>464</sup>

For the SEIS, NHTSA analyzed three action alternatives, Alternatives 1 through 3, which ranged from increasing CAFE stringency for MY 2024 by 9.14 percent for passenger cars and 11.02 percent for light trucks, and increase stringency in MYs 2025 and 2026 by 3.26 percent per year for both passenger cars and light trucks (Alternative 1) to increasing CAFE stringency for each year, for each fleet, at 10 percent per year (Alternative 3). The range of action alternatives, as well as the No Action Alternative, encompass a spectrum of possible standards NHTSA could determine was maximum feasible based on the different ways the agency could weigh EPCA’s four statutory factors. Throughout the SEIS, estimated impacts were shown for all of these action alternatives, as well as for the No Action Alternative. For a more detailed discussion of the environmental impacts associated with the alternatives, see Chapters 3–6 of the SEIS, as well as Section V of this preamble.

NHTSA’s SEIS describes potential environmental impacts to a variety of resources, including fuel and energy use, air quality, climate, land use and development, hazardous materials and regulated wastes, historical and cultural resources, noise, and environmental justice. The SEIS also describes how climate change resulting from global greenhouse gas emissions (including CO<sub>2</sub> emissions attributable to the U.S. light-duty transportation sector under the alternatives considered) could affect certain key natural and human resources. Resource areas are assessed qualitatively and quantitatively, as appropriate, in the SEIS, and the findings of that analysis are summarized here.<sup>465</sup>

<sup>464</sup> See 40 CFR 1502.2(e), 1502.14(d). CEQ has explained that “[T]he regulations require the analysis of the no action alternative even if the agency is under a court order or legislative command to act. This analysis provides a benchmark, enabling decision makers to compare the magnitude of environmental effects of the action alternatives [See 40 CFR 1502.14(c).] . . . Inclusion of such an analysis in the EIS is necessary to inform Congress, the public, and the President as intended by NEPA. [See 40 CFR 1500.1(a).]” Forty Most Asked Questions Concerning CEQ’s National Environmental Policy Act Regulations, 46 FR 18026 (Mar. 23, 1981).

<sup>465</sup> The impacts described in this section come from NHTSA’s SEIS, which is being publicly issued simultaneously with this NPRM. As described above, the SEIS is based on “unconstrained” modeling rather than “standard setting” modeling.

<sup>462</sup> Because this proposal revises CAFE standards established in the 2020 final rule, NHTSA chose to prepare a SEIS to inform that amendment of the MYs 2024–2026 standards. See the SEIS for more details.

<sup>463</sup> 40 CFR 1502.1.

As the stringency of the alternatives increases, total U.S. passenger car and light truck fuel consumption for the period of 2020 to 2050 decreases. Total light-duty vehicle fuel consumption from 2020 to 2050 under the No Action Alternative is projected to be 3,510 billion gasoline gallon equivalents (GGE). Light-duty vehicle fuel consumption from 2020 to 2050 under the action alternatives is projected to range from 3,409 billion GGE under Alternative 1 to 3,282 billion GGE under Alternative 3. Under Alternative 2, light-duty vehicle fuel consumption from 2020 to 2050 is projected to be 3,344 billion GGE. All of the action alternatives would decrease fuel consumption compared to the No-Action Alternative, with fuel consumption decreases that range from 100 billion GGE under Alternative 1 to 227 billion GGE under Alternative 3.

The relationship between stringency and criteria and air toxics pollutant emissions is less straightforward, reflecting the complex interactions among the tailpipe emissions rates of the various vehicle types (passenger cars and light trucks, ICE vehicles and EVs, older and newer vehicles, etc.), the technologies assumed to be incorporated by manufacturers in response to CAFE standards, upstream emissions rates, the relative proportions of gasoline, diesel, and electricity in total fuel consumption, and changes in VMT from the rebound effect. In general, emissions of criteria and toxic air pollutants increase very slightly in the short term, and then decrease dramatically in the longer term, across all action alternatives, with some exceptions. In addition, the action alternatives would result in decreased incidence of PM<sub>2.5</sub>-related health impacts in most years and alternatives due to the emissions decreases. Decreases in adverse health outcomes include decreased incidences of premature mortality, acute bronchitis, respiratory emergency room visits, and work-loss days.

The air quality analysis in the SEIS identified the following impacts on criteria air pollutants.

NHTSA conducts modeling both ways in order to reflect the various statutory requirements of EPCA/EISA and NEPA. The preamble employs the "standard setting" modeling in order to aid the decision-maker in avoiding consideration of the prohibited items in 49 U.S.C. 32902(h) in determining maximum feasible standards, but as a result, the impacts reported here may differ from those reported elsewhere in this preamble. However, NHTSA considers the impacts reported in the SEIS, in addition to the other information presented in this preamble, the TSD, and the PRIA, as part of its decision-making process.

For all criteria pollutants in 2025, emissions increase slightly under the action alternatives compared to the No-Action Alternative. The emission increases generally get larger (although they are still small) from Alternative 1 through Alternative 3 (the most stringent alternative in terms of required miles per gallon). This temporary increase is largely due to new vehicle prices increasing in the short-term, which slightly slows new-vehicle sales and encourages consumers to buy used vehicles instead or retain existing vehicles for longer. As the analysis timeframe progresses, the new, higher fuel-economy vehicles become used vehicles, and the impacts of the standards change direction. In 2025, across all criteria pollutants and action alternatives, the smallest increase in emissions is 0.01 percent for VOCs under Alternative 2; the largest increase is 0.6 percent and occurs for SO<sub>2</sub> under Alternative 3. We underscore that these are fractions of a single percent.

In 2035 and 2050, emissions of CO, NO<sub>x</sub>, PM<sub>2.5</sub>, and VOCs generally decrease under the action alternatives compared to the No-Action Alternative, except for CO in 2035 under Alternative 1 (0.07 percent increase) and NO<sub>x</sub> in 2035 under Alternative 3 (0.5 percent increase) (again, these are fractions of a single percent), with the more stringent alternatives having the largest decreases, except for NO<sub>x</sub> and PM<sub>2.5</sub> in 2035 (emissions decrease less or increase with more stringent alternatives) and NO<sub>x</sub> in 2050 (emissions increase under Alternative 3 relative to Alternative 2, due primarily to slightly higher upstream emissions associated with greater electrification rates). SO<sub>2</sub> emissions generally increase under the action alternatives compared to the No-Action Alternative (except in 2035 under Alternative 1), with the more stringent alternatives having the largest increases. SO<sub>2</sub> increases are largely due to higher upstream emissions associated with electricity use by greater numbers of electrified vehicles being produced in response to the standards. In 2035 and 2050, across all criteria pollutants and action alternatives, the smallest decrease in emissions is 0.03 percent and occurs for NO<sub>x</sub> under Alternative 2; the largest decrease is 11.9 percent and occurs for VOCs under Alternative 3. The smallest increase in emissions is 0.07 percent and occurs for CO under Alternative 1; the largest increase is 4.8 percent and occurs for SO<sub>2</sub> under Alternative 3.

*The air quality analysis identified the following impacts on toxic air pollutants.*

Under each action alternative in 2025 compared to the No-Action Alternative, increases in emissions would occur for all toxic air pollutants by as much as 0.5 (half of 1) percent, except for DPM, for which emissions would decrease by as much as 0.5 percent. For 2025, the largest relative increases in emissions would occur for benzene and 1,3-butadiene, for which emissions would increase by as much as 0.5 percent. Percentage increases in emissions of acetaldehyde, acrolein, and formaldehyde would be even smaller.

Under each action alternative in 2035 and 2050 compared to the No-Action Alternative, decreases in emissions would occur for all toxic air pollutants, except for acetaldehyde, acrolein, and 1,3-butadiene in 2035 under Alternative 1 where emissions would increase by 0.2 (one-fifth of 1), 0.01, and 0.1 percent, respectively, with the more stringent alternatives having the largest decreases, except for benzene (emissions increase in 2035 under Alternative 3 relative to Alternative 2). The largest relative decreases in emissions would occur for formaldehyde, for which emissions would decrease by as much as 10.3 percent. Percentage decreases in emissions of acetaldehyde, acrolein, benzene, 1,3-butadiene, and DPM would be less.

*The air quality analysis identified the following health impacts.*

In 2025, Alternative 3 would result in slightly increased adverse health impacts (mortality, acute bronchitis, respiratory emergency room visits, and other health effects) nationwide compared to the No-Action Alternative as a result of increases in emissions of NO<sub>x</sub>, PM<sub>2.5</sub>, and SO<sub>2</sub>. Alternative 2 would also result in slightly increased adverse health impacts from mortality and non-fatal heart attacks due to increases in NO<sub>x</sub>, PM<sub>2.5</sub>, and SO<sub>2</sub> emissions, while Alternative 1 would result in decreased adverse health impacts. The more stringent alternatives are associated with the largest increases in adverse health impacts, or the smallest decreases in impacts, relative to the No-Action Alternative. Again, in the short-term, these slight changes in health impacts are projected under the action alternatives as the result of increases in the prices of new vehicles slightly delaying sales of new vehicles and encouraging more VMT in older vehicles instead, but this trend shifts over time as higher fuel-economy new vehicles become used vehicles and older vehicles are removed from the fleet.

In 2035 and 2050, all action alternatives would result in decreased

adverse health impacts nationwide compared to the No-Action Alternative as a result of general decreases in emissions of NO<sub>x</sub>, PM<sub>2.5</sub>, and DPM. The decreases in adverse health impacts get larger from Alternative 1 to Alternative 3.

In terms of climate effects, all action alternatives would decrease U.S. passenger car and light truck fuel consumption compared with the No-Action Alternative, resulting in reductions in the anticipated increases in global CO<sub>2</sub> concentrations, temperature, precipitation, and sea level, and increases in ocean pH that would otherwise occur. The impacts of the action alternatives on global mean surface temperature, precipitation, sea level, and ocean pH would be small in relation to global emissions trajectories. Although these effects are small, they occur on a global scale and are long lasting; therefore, in aggregate, they can have large consequences for health and welfare and can make an important contribution to reducing the risks associated with climate change.

*The alternatives would have the following impacts related to GHG emissions.*

Passenger cars and light trucks are projected to emit 89,600 million metric tons of carbon dioxide (MMTCO<sub>2</sub>) from 2021 through 2100 under the No-Action Alternative. Alternative 1 would decrease these emissions by 5 percent through 2100. Alternative 3 would decrease these emissions by 10 percent through 2100. Emissions would be highest under the No-Action Alternative, and emission reductions would increase from Alternative 1 to Alternative 3.

Compared with total projected CO<sub>2</sub> emissions of 984 MMTCO<sub>2</sub> from all passenger cars and light trucks under the No-Action Alternative in the year 2100, the action alternatives are expected to decrease CO<sub>2</sub> emissions from passenger cars and light trucks in the year 2100 from 6 percent under Alternative 1 to 12 percent under Alternative 3.

The emission reductions in 2025 compared with emissions under the No-Action Alternative are approximately equivalent to the annual emissions from 1,284,000 vehicles under Alternative 1 to 2,248,000 vehicles under Alternative 3. For scale, a total of 253,949,000 passenger cars and light trucks are projected to be on the road in 2025 under the No-Action Alternative.

CO<sub>2</sub> emissions affect the concentration of CO<sub>2</sub> in the atmosphere, which in turn affects global temperature, sea level, precipitation, and ocean pH. For the analysis of direct

and indirect impacts, NHTSA used the Global Change Assessment Model Reference Scenario to represent the Reference Case emissions scenario (*i.e.*, future global emissions assuming no comprehensive global actions to mitigate GHG emissions).

Estimated CO<sub>2</sub> concentrations in the atmosphere for 2100 would range from 788.33 pollutant per million parts (ppm) under Alternative 3 to approximately 789.11 ppm under the No-Action Alternative, indicating a maximum atmospheric CO<sub>2</sub> decrease of approximately 0.77 ppm compared to the No-Action Alternative. Atmospheric CO<sub>2</sub> concentration under Alternative 1 would decrease by 0.37 ppm compared with the No-Action Alternative.

Global mean surface temperature is projected to increase by approximately 3.48 °C (6.27 °F) under the No-Action Alternative by 2100. Implementing the most stringent alternative (Alternative 3) would decrease this projected temperature rise by 0.003 °C (0.006 °F), while implementing Alternative 1 would decrease projected temperature rise by 0.002 °C (0.003 °F).

Projected sea-level rise in 2100 ranges from a high of 76.28 centimeters (30.03 inches) under the No-Action Alternative to a low of 76.22 centimeters (30.01 inches) under Alternative 3. Alternative 3 would result in a decrease in sea-level rise equal to 0.06 centimeter (0.03 inch) by 2100 compared with the level projected under the No-Action Alternative compared to a decrease under Alternative 1 of 0.03 centimeter (0.01 inch) compared with the No-Action Alternative.

Global mean precipitation is anticipated to increase by 5.85 percent by 2100 under the No-Action Alternative. Under the action alternatives, this increase in precipitation would be reduced by 0.00 to 0.01 percent.

Ocean pH is anticipated to be 8.2180 under Alternative 3, about 0.0004 more than the No-Action Alternative. Under Alternative 1, ocean pH in 2100 would be 8.2178, or 0.0002 more than the No-Action Alternative.

The action alternatives would reduce the impacts of climate change that would otherwise occur under the No-Action Alternative. Although the projected reductions in CO<sub>2</sub> and climate effects are small compared with total projected future climate change, they are quantifiable and directionally consistent and would represent an important contribution to reducing the risks associated with climate change.

Although NHTSA does quantify the changes in monetized damages that can be attributable to each action

alternative, many specific impacts of climate change on health, society, and the environment cannot be estimated quantitatively. Therefore, NHTSA provides a qualitative discussion of these impacts by presenting the findings of peer-reviewed panel reports including those from the Intergovernmental Panel on Climate Change (IPCC), U.S. Global Change Research Program (GCRP), the U.S. Climate Change Science Program (CCSP), the National Research Council, and the Arctic Council, among others. While the action alternatives would decrease growth in GHG emissions and reduce the impact of climate change across resources relative to the No-Action Alternative, they would not themselves prevent climate change and associated impacts. Long-term climate change impacts identified in the scientific literature are briefly summarized below, and vary regionally, including in scope, intensity, and directionality (particularly for precipitation). While it is difficult to attribute any particular impact to emissions that could result from this proposal, the following impacts are likely to be beneficially affected to some degree by reduced emissions from the action alternatives:

- Impacts on freshwater resources could include changes in rainfall and streamflow patterns, warming temperatures and reduced snowpack, changes in water availability paired with increasing water demand for irrigation and other needs, and decreased water quality from increased algal blooms. Inland flood risk could increase in response to increasing intensity of precipitation events, drought, changes in sediment transport, and changes in snowpack and the timing of snowmelt.

- Impacts on terrestrial and freshwater ecosystems could include shifts in the range and seasonal migration patterns of species, relative timing of species' life-cycle events, potential extinction of sensitive species that are unable to adapt to changing conditions, increases in the occurrence of forest fires and pest infestations, and changes in habitat productivity due to increased atmospheric concentrations of CO<sub>2</sub>.

- Impacts on ocean systems, coastal regions, and low-lying areas could include the loss of coastal areas due to inundation, submersion, or erosion from sea-level rise and storm surge, with increased vulnerability of the built environment and associated economies. Changes in key habitats (*e.g.*, increased temperatures, decreased oxygen, decreased ocean pH, increased

salinization) and reductions in key habitats (e.g., coral reefs) may affect the distribution, abundance, and productivity of many marine species.

- Impacts on food, fiber, and forestry could include increasing tree mortality, forest ecosystem vulnerability, productivity losses in crops and livestock, and changes in the nutritional quality of pastures and grazing lands in response to fire, insect infestations, increases in weeds, drought, disease outbreaks, or extreme weather events. Increased concentrations of CO<sub>2</sub> in the atmosphere can also stimulate plant growth to some degree, a phenomenon known as the CO<sub>2</sub> fertilization effect, but the impact varies by species and location. Many marine fish species could migrate to deeper or colder water in response to rising ocean temperatures, and global potential fish catches could decrease. Impacts on food and agriculture, including yields, food processing, storage, and transportation, could affect food prices, socioeconomic conditions, and food security globally.

- Impacts on rural and urban areas could affect water and energy supplies, wastewater and stormwater systems, transportation, telecommunications, provision of social services, incomes (especially agricultural), air quality, and safety. The impacts could be greater for vulnerable populations such as lower-income populations, historically underserved populations, some communities of color and tribal and Indigenous communities, the elderly, those with existing health conditions, and young children.

- Impacts on human health could include increases in mortality and morbidity due to excessive heat and other extreme weather events, increases in respiratory conditions due to poor air quality and aeroallergens, increases in water and food-borne diseases, increases in mental health issues, and changes in the seasonal patterns and range of vector-borne diseases. The most disadvantaged groups such as children, the elderly, the sick, those experiencing discrimination, historically underserved populations, some communities of color and tribal and Indigenous communities, and low-income populations are especially vulnerable and may experience disproportionate health impacts.

- Impacts on human security could include increased threats in response to adversely affected livelihoods, compromised cultures, increased or restricted migration, increased risk of armed conflicts, reduction in adequate essential services such as water and energy, and increased geopolitical rivalry.

In addition to the individual impacts of climate change on various sectors, compound events may occur more frequently. Compound events consist of two or more extreme weather events occurring simultaneously or in sequence when underlying conditions associated with an initial event amplify subsequent events and, in turn, lead to more extreme impacts. To the extent the action alternatives would result in reductions in projected increases in global CO<sub>2</sub> concentrations, this rulemaking would contribute to reducing the risk of compound events.

NHTSA has considered the SEIS carefully in arriving at its tentative conclusion that Alternative 2 is maximum feasible, as discussed below. We seek comment on the SEIS associated with this NPRM.

#### *D. Evaluating the EPCA Factors and Other Considerations To Arrive at the Proposed Standards*

Despite only one year having passed since the 2020 final rule, enough has changed in the United States and in the world that revisiting the CAFE standards for MYs 2024–2026 is reasonable and appropriate. The global coronavirus pandemic, with all of its tragedy, also demonstrated what happens to U.S. and global oil consumption (and CO<sub>2</sub> and other pollutant emissions) when driving demand plummets. The Biden Administration committed itself in its earliest moments to improving energy conservation and tackling climate change. Nearly all auto manufacturers have announced forthcoming new advanced technology, high-fuel-economy vehicle models, making strong public commitments that mirror those of the Administration. Five major manufacturers voluntarily bound themselves to stricter GHG national-level requirements as part of the California Framework agreement. While some facts on the ground remain similar to what was before NHTSA in the prior analysis—gas prices remain relatively low in the U.S., for example, and while light-duty vehicle sales fell sharply in MY 2020, the vehicles that *did* sell tended to be, on average, larger, heavier, and more powerful, all factors which increase fuel consumption—again, enough has changed that a rebalancing of the EPCA factors is appropriate for model years 2024–2026.

In the 2020 final rule, NHTSA interpreted the need of the U.S. to conserve energy as less important than in previous rulemakings. This was in part because of structural changes in global oil markets as a result of shale oil drilling in the U.S., but also because in

the context of environmental effects, NHTSA interpreted the word “conserve” as “to avoid waste.” NHTSA concluded then that the ultimate difference to the climate (among the regulatory alternatives) of thousandths of a degree Celsius in 2100 did not represent a “wasteful” use of energy, given the other considerations involved in the balancing of factors.

One of those factors was consumer demand for vehicles with higher fuel economy levels. In the 2020 final rule, NHTSA expressed concern that low gasoline prices and apparent consumer preferences for larger, heavier, more powerful vehicles would make it exceedingly difficult for manufacturers to achieve higher standards without negative consequences to sales and jobs, and would cause consumer welfare losses. Since then, however, more and more manufacturers are announcing more and more vehicle models with advanced engines and varying levels of electrification. It is reasonable to conclude that manufacturers (who are all for-profit companies) would not be announcing plans to offer these types of vehicles if they did not expect to be able to sell them,<sup>466</sup> and thus that manufacturers are more sanguine about consumer demand for fuel efficiency and the market for fully electric vehicles going forward than they have been previously.

Additionally, NHTSA no longer believes that it is reasonable or appropriate to focus only on “avoiding waste” in evaluating the need of the U.S. to conserve energy. EPCA’s overarching purpose is energy conservation. The need of the U.S. to conserve energy may be reasonably interpreted as continuing to push the balancing toward greater stringency.

The following sections will walk through the four statutory factors in more detail and discuss NHTSA’s decision-making process more thoroughly. To be clear at the outset, however, the fundamental balancing of factors for this proposal is different from the 2020 final rule because the evidence suggests that manufacturers believe there is a market for advanced technology vehicles with higher fuel economy, and CAFE standards are likely to be maximum feasible if they are set at levels that reflect that evidence.

<sup>466</sup> To the extent that manufacturers are offering these vehicles in response to expected regulations, NHTSA still believes that they would not do so if they believed the vehicles were unsaleable or unmanageably detrimental to profits. Vehicle manufacturers are sophisticated corporate entities well able to communicate their views to regulatory agencies.

We may begin with the need of the U.S to conserve energy, which as stated is being considered more holistically in this proposal as compared to in the 2020 final rule. According to the analysis presented in Section V and in the accompanying PRIA and SEIS, Alternative 3 would save consumers the most in fuel costs, and would achieve the greatest reductions in climate change-causing CO<sub>2</sub> emissions. Alternative 3 would also maximize fuel consumption reductions, better protecting consumers from international oil market instability and price spikes. As discussed above, for now, gasoline is still the dominant fuel used in light-duty transportation. As such, consumers, and the economy more broadly, are subject to fluctuations in price that impact the cost of travel and, consequently, the demand for mobility. Vehicles are long-lived assets and the long-term price uncertainty of petroleum still represents a risk to consumers. By increasing the fuel economy of vehicles in the marketplace, more stringent CAFE standards better insulate consumers against these risks over longer periods of time. Fuel economy improvements that reduce demand for oil are a more certain hedging strategy against price volatility than increasing U.S. energy production. Continuing to reduce the amount of money consumers spend on vehicle fuel thus remains an important consideration for the need of the U.S. to conserve energy.

Additionally, the SEIS finds that overall, projected changes in both upstream and downstream emissions of

criteria and toxic air pollutants are mixed, with emissions of some pollutants remaining constant or increasing and emissions of some pollutants decreasing. These increases are associated with both upstream and downstream sources, and therefore, may disproportionately affect minority and low-income populations that reside in proximity to these sources. However, the magnitude of the change in emissions relative to the No-Action alternative is minor for all action alternatives, and would not be characterized as high or adverse; over time, adverse health impacts are projected to decrease nationwide under each of the action alternatives.

For the other considerations that contribute to the need of the U.S. to conserve energy, it follows reasonably that reducing fuel consumption more would improve our national balance of payments more, and our energy security, as discussed above. It is therefore likely that Alternative 3 best meets the need of the U.S. to conserve energy.

During interagency review, the Department of Energy urged NHTSA to propose Alternative 3, on the basis that “a faster transition to battery electric vehicles (BEVs) is feasible,” because a variety of market analysts and the National Academies of Sciences, Engineering, and Medicine find that BEVs will reach cost parity with ICE vehicles by or before 2025. DOE further commented that new BEV prices would drop over time because “DOE has set aggressive technology targets for battery costs and electric drive technologies, . . . And DOE has a consistent track

record in meeting its technology targets: DOE met or exceeded its technology cost and performance goals for battery and electric drive technologies every year between 2012 and 2018.” [citation omitted] While NHTSA appreciates this comment from DOE, as stated repeatedly throughout this proposal, NHTSA is statutorily prohibited from considering the fuel economy of dedicated alternative fuel vehicles during the rulemaking time frame when determining what levels of standards would be maximum feasible. NHTSA believes that Alternative 3 could potentially end up being maximum feasible in the final rule depending on a variety of factors, but NHTSA would be prohibited from basing such a finding exclusively on the date by which DOE estimates that BEVs will achieve cost parity with ICEs.

We next evaluate how the regulatory alternatives fare in terms of economic practicability. NHTSA recognizes that the amount of lead time available before MY 2024 is less than what was provided in the 2012 rule. As will be discussed further below, NHTSA believes that the evidence suggests that the proposed standards are still economically practicable, and not out of reach for a significant portion of the industry. CAFE standards can help support industry by requiring ongoing improvements even if demand for more fuel economy flags unexpectedly.

For the proposed standards, the annual rates of increase in the passenger car and light truck standards represent increases over the required levels in MY 2023 and are as shown in Table VI-6.

**Table VI-6 – Annual Rate of Increase in Proposed CAFE Stringency for Each Model Year from 2024 to 2026**

Model year	Passenger Car (percent)	Light Truck (percent)
2024	8	8
2025	8	8
2026	8	8

Part of the way that we try to evaluate economic practicability, and thus where the tipping point in the balancing of factors might be, is through a variety of metrics, examined in more detail below. If the amounts of technology or per-vehicle cost increases required to meet the standards appear to be beyond what we believe the market could bear; or sales and employment appear to be

unduly impacted, the agency may decide that the standards under consideration may not be economically practicable. We underscore again, as throughout this preamble, that the modeling analysis does not dictate the “answer,” it is merely one source of information among others that aids the agency’s balancing of the standards. We similarly underscore that there is no

single bright line beyond which standards might be economically practicable, and that these metrics are not intended to suggest one; they are simply ways to think about the information before us.

Economic practicability may be evaluated in terms of how much technology manufacturers would have to apply to meet a given regulatory

alternative. Technology application can be considered as “which technologies, and when”—both the technologies that NHTSA’s analysis suggests would be used, and how that application occurs given manufacturers’ product redesign cadence. While the need of the U.S. to conserve energy may encourage the agency to be more technology-forcing in its balancing, and while technological feasibility is not limiting in this rulemaking given the state of technology in the industry, regulatory alternatives that require extensive application of very advanced technologies (that may have known or unknown consumer acceptance issues) or that require manufacturers to apply additional technology in earlier model years, in which meeting the standards is already challenging, may not be economically practicable, and may thus be beyond maximum feasible.

The first issue is timing of technology application. While the MY 2024 standards provide less lead time for an increase in stringency than was provided by the standards set in 2012, NHTSA believes that the standards for MYs 2021–2023 should provide a relative “break” for compliance purposes. NHTSA does not believe that significant additional technology application would be required by the CAFE standards in the years immediately preceding the rulemaking

time frame. That said, NHTSA is aware of, and has accounted for, several manufacturers voluntarily agreeing with CARB to increase their fuel economy during those model years. Manufacturers would have to apply more technology than would be required by the MYs 2021–2023 CAFE standards alone to meet those higher fuel economy levels. Again, NHTSA interprets these agreements as evidence that the participating companies believe that applying that additional technology is practicable, because for-profit companies can likely be relied upon to make decisions that maximize their profit. Companies who did not agree with CARB to meet higher targets may not increase their fuel economy levels by as much over MYs 2021–2023, but they, too, will get the relative “break” in CAFE obligations mentioned above, and have additional time to plan for the higher stringency increases in subsequent years. Those manufacturers can opt to employ more modest technologies to improve fuel economy (beyond their standard) to generate credits to carry forward into more challenging years, or concentrate limited research and development resources on the next generation of higher fuel economy vehicles that will be needed to meet the proposed standards in MYs 2024–2026 (and

beyond), rather investing in more modest improvements in the near-term.

NHTSA’s analysis estimates manufacturers’ product “cadence,” representing them in terms of estimated schedules for redesigning and “freshening” vehicles, and assuming that significant technology changes will be implemented during vehicle redesigns—as they historically have been. Once applied, a technology will be carried forward to future model years until superseded by a more advanced technology. NHTSA does not consider model years in isolation in the analysis, because that is not consistent with how industry responds to standards, and thus would not accurately reflect practicability. If manufacturers are already applying technology widely and intensively to meet standards in earlier years, requiring them to add yet more technology in the model years subject to the rulemaking may be less economically practicable; conversely, if the preceding model years require less technology, more technology during the rulemaking time frame may be more economically practicable. The tables below illustrate how the agency has modeled that process of manufacturers applying technologies in order to comply with different alternative standards. The technologies themselves are described in detail in Chapters 2 and 3 of the accompanying TSD.

**Table VI-7 – Estimated Market Share (%) of Selected Technologies, Passenger Cars, Alternative 2 and Alternative 3, Standard Setting Analysis**

Tech	Alt	2020	2023	2024	2025	2026

Although NHTSA's analysis is intended to estimate ways manufacturers *could* respond to new standards, not to predict how manufacturers *will* respond to new standards, manufacturers have indicated in meetings with the agency and in public announcements (including the CARB Framework Agreements) that they do intend to increase technology application over the coming years, and specifically electrification technology which NHTSA does not model as part of its standard-setting analysis, considered for decision-making, due to the 49 U.S.C. 32902(h) restrictions for MYs 2024–2026.

As the tables illustrate, both Alternative 2 and Alternative 3 appear to require rapid deployment of fuel efficiency technology across a variety of vehicle systems—body improvements due to weight reduction and improved aerodynamic drag, engine advancements, and electrification.<sup>467</sup> The aggressive application that is simulated to occur between MY 2020 (which NHTSA observed and is the starting point of this analysis) and MY 2023 occurs in all of the alternatives, for both cars and light trucks. This reflects

both the task presented to signatories by the California Framework and existing compliance positions (in some fleets) across the industry to improve fuel economy in the near-term. In general, technology market shares for Alternative 3 look similar to those for Alternative 2, with the notable exception of plug-in hybrids which differ by only a couple of percent for cars and about 5 percent for light trucks. While still relatively small differences on their own, the market share of plug-in hybrids is currently less than one percent in total. While manufacturers could certainly choose to produce fully electric vehicles instead of PHEVs, fully electric vehicles are projected to grow by multiples of their current market share as well. The market for high levels of electrification is likely to continue growing but NHTSA acknowledges that consumer demand, especially in the near-term, remains somewhat unclear. If policy decisions are made to extend or expand incentives for electric vehicle purchases, NHTSA could potentially consider the greater reliance on electrification in Alternative 3 to be a smaller risk.

NHTSA's analysis seeks to account for manufacturers' capital and resource constraints in several ways—through the restriction of technology application to refreshes and redesigns, through the phase-in caps applied to certain technologies, and through the explicit

consideration of vehicle components (like powertrains) and technologies (like platforms based on advanced materials) that are shared by models throughout a manufacturer's portfolio. NHTSA is aware that there is a significant difference in the level of capital and resources required to implement one or more new technologies on a single vehicle model, and the level of capital and resources required to implement those same technologies across the entire vehicle fleet. NHTSA realizes that it would not be economically practicable to expand some of the most advanced technologies to every vehicle in the fleet within the rulemaking time frame, although it should be possible to increase the application of advanced technologies across the fleet in a progression that accounts for those resource constraints. That is what NHTSA's analysis tries to do.

Another consideration for economic practicability is the extent to which new standards could increase the average cost to acquire new vehicles, because even insofar as the underlying application of technology leads to reduced outlays for fuel over the useful lives of the affected vehicles, these per-vehicle cost increases provide both a measure of the degree of effort faced by manufacturers, and also the degree of adjustment, in the form of potential vehicle price increases, that will ultimately be required of vehicle

<sup>467</sup> While these technology pathways reflect NHTSA's statutory restrictions under EPCA/EISA, it is worth noting that they represent only one possible solution. In the simulations that support the SEIS, PHEV market share grows by less, and is mostly offset by an increase in BEV market share.

purchasers. Table VI-9 and Table VI-10 show the agency's estimates of average cost increase under the Preferred Alternative for passenger cars and light trucks, respectively. Because our analysis includes estimates of manufacturers' indirect costs and profits, as well as civil penalties that some manufacturers (as allowed under EPCA/EISA) might elect to pay in lieu of achieving compliance with CAFE standards, we report cost increases as estimated average increases in vehicle price (as MSRP). These are average values, and the agency does not expect that the prices of every vehicle would increase by the same amount; rather, the

agency's underlying analysis shows unit costs varying widely between different vehicle models. For example, a small SUV that replaces an advanced internal combustion engine with a plug-in hybrid system may incur additional production costs in excess of \$10,000, while a comparable SUV that replaces a basic engine with an advanced internal combustion engine incurs a cost closer to \$2,000. While we recognize that manufacturers will distribute regulatory costs throughout their fleet to maximize profit, we have not attempted to estimate strategic pricing, having insufficient data (which would likely be confidential business information (CBI))

on which to base such an attempt. To provide an indication of potential price increases relative to today's vehicles, we report increases relative to the market forecast using technology in the MY 2020 fleet—the most recent actual fleet for which we have information sufficient for use in our analysis. We provide results starting in MY 2023 in part to illustrate the cost impacts in the first model year that we believe manufacturers might actually be able to change their products in preparation for compliance with standards in MYs 2024–2026.

Relative to current vehicles (again, as represented here by technology in the MY 2020 fleet, the most recent for which NHTSA has adequate data), NHTSA judges these cost increases to be significant, but not impossible for the market to bear. Cost increases will be partially offset by fuel savings, which consumers will experience eventually, if not concurrent with the upfront increase in purchase price. And as discussed

previously, nearly every manufacturer has already indicated their intent to continue introducing advanced technology vehicles between now and MY 2026. Again, NHTSA believes that manufacturers introduce new vehicles (and technologies) expecting that there is a market for them—if not immediately, then in the near future. For-profit companies cannot afford to lose money indefinitely. This trend

suggests that manufacturers believe that at least some cost increases should be manageable for consumers.

Relative to the Preferred Alternative, however, NHTSA notes significant further cost increases for several major manufacturers under Alternative 3. Table VI-11 and Table VI-12 show additional technology costs estimated to be incurred under Alternative 3 as compared to the Preferred Alternative.

For example, Honda's light truck fleet appears to hit an inflection point in cost where much more aggressive technology application is required in order to comply with Alternative 3. In general,

light truck fleets appear to be pressed harder to comply with Alternative 3 than passenger car fleets across the industry. For example, Ford's passenger car compliance costs are estimated to

increase minimally between Alternative 2 and Alternative 3, but light truck compliance costs increase by over 40 percent (in most years). A number of other manufacturers are pushed in both

fleets (Honda, Toyota, and Kia, for example), and make significant additional investments in fuel economy technology to reach compliance with the standards in Alternative 3.

Changes in costs for new vehicles are not the only costs that NHTSA considers in balancing the statutory factors—fuel costs for consumers are relevant to the need of the U.S. to conserve energy, and NHTSA believes

that consumers themselves weigh expected fuel savings against increases in purchase price for vehicles with higher fuel economy. Fuel costs (or savings) continue to be the largest source of benefits for CAFE standards, and GHG reduction benefits, which are also part of the need of the U.S. to conserve energy, are also increasing. E.O. 12866 and Circular A–4 also direct agencies to consider maximizing net

benefits in rulemakings whenever possible and consistent with applicable law. Thus, because it can be relevant to balancing the statutory factors and because it is directed by E.O. 12866 and OMB guidance, NHTSA also considers the net benefits attributable to the different regulatory alternatives, as shown in Table VI–13.

**Table VI-13 – Summary of Cumulative Benefits and Costs for Model Years through MY 2029, by Alternative and Discount Rate**

		Alternative 1	Alternative 2	Alternative 3
3% Rate	Total Benefits	82.6	121.4	172.9
	Total Costs	66.5	121.1	176.3
	Net Benefits	16.1	0.3	-3.4
7% Rate	Total Benefits	51.6	75.6	107.6
	Total Costs	49.3	90.7	132.8
	Net Benefits	2.3	-15.1	-25.2

While maximizing net benefits is a valid decision criterion for choosing among alternatives, it is not the only reasonable decision perspective. When NHTSA recognizes that the need of the U.S. to conserve fuel weighs importantly in the overall balancing of factors, it is reasonable to consider choosing the regulatory alternative that produces the largest reduction in fuel consumption, while remaining net beneficial. The benefit-cost analysis is not the sole factor that NHTSA considers in determining the maximum feasible stringency, though it supports NHTSA's tentative conclusion that Alternative 2 is the maximum feasible stringency. While Alternative 1 produces higher net benefits, it also continues to allow fuel consumption that could have been avoided in a cost-beneficial manner. And while Alternative 3 achieves greater reductions in fuel consumption than Alternative 2, it shows relatively high negative net benefits under both discount rates.

While NHTSA estimates that new vehicle sales will be slightly lower under Alternative 2 than under the No-Action Alternative, as a consequence of the higher retail prices that result from additional technology application, the difference is only about 1 percent over the entire period covered by MYs 2020–

2026. NHTSA does not believe that this estimated change in new vehicle sales over the period covered by the rule is a persuasive reason to choose another regulatory alternative. Similarly, the estimated labor impacts within the automotive industry provide no evidence that another alternative should be preferred. While the change in sales is estimated to decrease industry employment over the period, the decrease is even smaller than the impact on new vehicle sales (about 0.1 percent). As NHTSA explained earlier in defining economic practicability, standards simply should avoid a *significant* loss of jobs, and may still be economically practicable even though they appear to show a negative impact (here, a very slight impact) on sales and employment.

As with any analysis of sufficient complexity, there are a number of critical assumptions here that introduce uncertainty about manufacturer compliance pathways, consumer responses to fuel economy improvements and higher vehicle prices, and future valuations of the consequences from higher CAFE standards. While NHTSA considers dozens of sensitivity cases to measure the influence of specific parametric assumptions and model relationships, only a small number of them

demonstrate meaningful impacts to net benefits under the proposed standards.

Looking at these cases more closely, the majority of both costs and benefits that occur under the proposed standards accrue to buyers of new cars and trucks, rather than society in general. It then follows that the assumptions that exert the greatest influence over private costs and benefits also exert the greatest influence over net benefits—chief among these is the assumed trajectory of future fuel prices, specifically gasoline. NHTSA considers the “High Oil Price” and “Low Oil Price” cases from AEO 2021 as bounding cases, though they are asymmetrical (while the low case is only about 25 percent lower than the Reference case on average, the high case is almost 50 percent higher on average). The sensitivity cases suggest that fuel prices exert considerable influence on net benefits—where higher and lower prices not only determine the dollar value of each gallon saved, but also how market demand responds to higher levels of fuel economy in vehicle offerings. Under the low case, net benefits become negative and exceed \$30 billion, but increase to almost (positive) \$50 billion in the high case (the largest increase among any sensitivity cases run for this proposal). This suggests that the net benefits resulting from this proposal are

dependent upon the future price of gasoline being at least as high as the AEO 2021 Reference Case projects.

Another critical uncertainty that affects private benefits is the future cost of advanced electrification technologies, specifically batteries. These emerging technologies provide both the greatest fuel savings to new car buyers and impose the highest technology costs (at the moment). While the cost to produce large vehicle batteries has been rapidly declining for years, they are still expensive relative to advancements in internal combustion engines and transmissions. However, the analysis projects continued cost learning over time and shows battery electric vehicles reaching price parity with conventional vehicles in the 2030s for most market segments—after which market adoption of BEVs accelerates—although other estimates show price parity occurring sooner and we seek comment on whether and how to use those estimates in our analysis for the final rule. Electrification is also a viable compliance strategy, as partially or fully electric vehicles benefit from generous compliance incentives that improve their estimated fuel economy relative to measured energy consumption. As such, the assumption about future battery costs has the ability to influence compliance costs to manufacturers and prices to consumers, the rate of electric vehicle adoption in the market, and thus the emissions associated with their operation. NHTSA considered two different mechanisms to affect battery costs: Higher/lower direct costs, and faster/slower cost learning rates. The two mechanisms that reduce cost (whether by faster cost learning or lower direct costs) both increase net benefits relative to the central case, though lowering initial direct costs by 20 percent had a greater effect than increasing the learning rate by 20 percent. Increasing cost (through either mechanism) by 20 percent produced a similar effect, but in the opposite direction (reducing net benefits). However, none of those cases exerted a level of influence that compares to alternative fuel price assumptions.

There is one assumption that affects the analysis without influencing the benefits and costs that accrue to new car buyers: The social cost of damages attributable to greenhouse gas emissions. While there is no feedback in either the analysis or the policy between the assumed social cost of GHGs and metric tons of GHGs emitted (or gallons of fuel consumed), it directly controls the valuation of each metric ton saved over time. The central analysis assumes a SC-GHG cost based on the 2.5 percent

discount rate for the 3 percent social discount rate, and a SC-GHG cost based on the 3 percent discount rate in the 7 percent social discount rate case. However, this assumption directly scales total benefits by increasing (or decreasing) the value of each ton saved. Using the highest SCC-GHG, based on the 95th percentile estimate, pushes net benefits above \$30 billion under Alternative 2. NHTSA does not independently develop the SC-GHG assumptions used in this proposal but takes them from the interagency working group on the social cost of GHGs. If future analyses by that group determine that the SC-GHG should be different from what it currently is, NHTSA will consider those values and whether to include them in subsequent analyses. As the sensitivity cases illustrate, their inclusion could exert enough influence on net benefits to suggest that a different alternative could represent the maximum feasible stringency—at least based on the decision criteria described in this section. As mentioned above, NHTSA is seeking comment on the methodology employed by that group for determining the SC-GHG.

Based on all of the above, NHTSA tentatively concludes that while all of the action alternatives are technologically feasible, Alternative 3 may be too costly to be economically practicable in the rulemaking timeframe, even if choosing it could result in greater fuel savings. NHTSA interprets the need of the U.S. to conserve energy as pushing the balancing toward greater stringency—consumer savings on fuel costs are estimated to be higher under Alternative 3 than under Alternative 2, but the additional technology cost required to meet Alternative 3 (as evidenced by the negative net benefits at both discount rates) may yet make Alternative 3 too stringent for these model years. Changes in criteria pollutants, health effects, and vehicle safety effects are relatively minor under all action alternatives, and thus not dispositive. NHTSA has considered the effect of other motor vehicle standards of the Government by incorporating the fuel economy effects of California's ZEV program into its baseline, and calculating the costs and benefits of CAFE standards as above and beyond those baseline costs and benefits. The additional costs of the proposed standards are, on average, not far from what NHTSA estimated in the 2012 final rule for standards in a similar timeframe; the additional benefits are lower, but this is due to a variety of factors, including significant addition of

fuel-economy-improving technology to new vehicles between then and now (including the growing market for electric vehicles), and lower fuel price projections from EIA. To the extent that higher prices for new vehicles as a result of the technology required by the standards could translate to decreases in new vehicle sales, we note that those effects appear small, as discussed above. Moreover, improving the fuel efficiency of new vehicles has effects over time, not just at point of first sale, on consumer fuel savings. Somewhat-more-expensive-but-more-efficient new vehicles eventually become more-efficient used vehicles, which may be purchased by consumers who may be put off by higher new vehicle prices. The benefits have the potential to continue across the fleet and over time, for all consumers regardless of their current purchasing power.

NHTSA recognizes, again, that lead time for this proposal is less than past rulemakings have provided, and that the economy and the country are in the process of recovering from a global pandemic. NHTSA also recognizes that at least parts of the industry are nonetheless making announcement after announcement of new forthcoming advanced technology, high-fuel-economy vehicle models, and does not believe that they would be doing so if they thought there was no market at all for them. Perhaps some of the introductions are driven by industry perceptions of future regulation, but the fact remains that the introductions are happening. CAFE standards can help to buttress this momentum by continuing to require the fleets as a whole to improve their fuel economy levels steadily over the coming years, so that a handful of advanced technology vehicles do not inadvertently allow backsliding in the majority of the fleet that will continue to be powered by internal combustion for likely the next 5–10 years. CAFE standards that increase steadily may help industry make this transition more smoothly.

And finally, if the purpose of EPCA is energy conservation, and NHTSA is interpreting the need to conserve energy to be largely driven by fuel savings, energy security, and environmental concerns, then it makes sense to interpret EPCA's factors as asking the agency to push stringency as far as possible before benefits become negative. The energy conservation benefits of Alternative 3 appear, under the current analysis, to be highest, as discussed in the SEIS and in Section VI.C above, and better protect consumers from international oil market instability and price spikes. By

increasing the fuel economy of vehicles in the marketplace, more stringent CAFE standards better insulate consumers against these risks over longer periods of time. Fuel economy improvements that reduce demand for oil are a more certain hedging strategy against price volatility than increasing U.S. energy production. However, with negative net benefits for Alternative 3 under both discount rates, it may be that for the moment, the costs of achieving those benefits are more than the market is willing to bear. NHTSA thus aims to help bolster the industry's trajectory toward higher future standards, by keeping stringency high in the mid-term, but not so high as to be economically impracticable.

NHTSA therefore proposes that Alternative 2 is maximum feasible for MYs 2024–2026. We seek comment on this tentative conclusion.

## VII. Compliance and Enforcement

### A. Introduction

#### 1. Overview of the NHTSA Compliance Program

A manufacturer's fleet is divided into three compliance categories of automobiles: Passenger vehicles manufactured domestically, passenger vehicles not manufactured domestically; and non-passenger automobiles.<sup>468</sup> Each category has its own CAFE fleet mpg standard that a manufacturer is required to meet. The CAFE standard is determined for each model year by a combination of the production volume of vehicles produced for sale, the footprint of those vehicles, and the requisite CAFE footprint-based fuel economy target curves.

For each compliance category, manufacturers self-report data at the end of each MY in the form of a Final Model Year Report, and once these data are verified by EPA, NHTSA determines final compliance. Using EPA's final verified data, a manufacturer fleet is determined to be compliant if the 2-cycle CAFE performance of their fleet with the addition of the Alternative Motor Fuels Act (AMFA) and AC/OC incentives are equal to or greater than the CAFE fleet mpg standard. The manufacturer fleet is out of compliance if its fleet mpg falls below the CAFE mpg standard, in which case the manufacturer may resolve the shortfall through civil penalties or the use of flexibilities. Resolving a shortfall through flexibilities may include the

application of CAFE credits through trade, carry-forward, carry-back, or transfer from within the manufacturer's fleet accounts or from another manufacturer's fleet accounts.

The following sections provide a brief overview how CAFE standards and compliance values are derived, what compliance flexibilities and incentives are available to manufacturers, and the revisions to the CAFE program NHTSA is proposing in this rulemaking. In summary, NHTSA is proposing to: (1) Increase and clarify flexibilities for its off-cycle program; (2) revive incentives for hybrid and electric full-size pickup trucks through MY 2025; (3) modify its standardized templates for CAFE reporting and credit transactions; and (4) add a new template for manufacturers to report information on the monetary and non-monetary costs associated with credit trades.

#### 2. How Manufacturers' Target and Achieved Performances Are Calculated

Compliance begins each model year with manufacturers testing vehicles on a dynamometer in a laboratory over pre-defined test cycles and controlled conditions.<sup>469</sup> EPA and manufacturers use two different dynamometer test procedures—the Federal Test Procedure (FTP) and the Highway Fuel Economy Test (HFET) to determine fuel economy. These procedures originated in the early 1970s and were intended to generally represent city and highway driving conditions, respectively. These two tests are commonly referred to as the “2-cycle” test procedures for CAFE. A machine is connected to the vehicle's tailpipe while it performs the test cycle, which collects and analyzes exhaust

gases, such as CO<sub>2</sub> quantities.<sup>470</sup> Fuel economy is determined from relating a derived emissions factor to the amount of observed CO<sub>2</sub> using a reference test fuel.<sup>471</sup> Manufacturers continue to test vehicles over the course of the model year and will test enough vehicles to cover approximately 90 percent of the subconfigurations within each model type. Manufacturers self-report this information to EPA as part of their end-of-the-model year reports, which are due 90 days after the model year is completed. After manufacturers submit their reports, EPA confirms and validates those results by testing a random sample of vehicles at the National Vehicle and Fuel Emissions Laboratory (NVFEL) in Ann Arbor, Michigan.

A manufacturer's fleet fuel economy performance (hereafter referenced as Base CAFE) for a given model year is calculated through the following steps:

- Each vehicle model's mile per gallon (mpg) performance in the city and highway test cycles are calculated based off the carbon emitted during dynamometer testing. The vehicle's mpg performance is combined at 55 percent city and 45 percent highway. Measurement incentives for alternative fuel vehicles (such as for electricity, counting 15 percent of the actual energy used to determine the gasoline equivalent mpg) are applied as part of these procedures;
- Performance improvements not fully captured through 2-cycle dynamometer testing, such as eligible A/C and off-cycle technologies are then added to the vehicle's mpg performance. Incentives for full-size pickup trucks with mild or strong HEV technology or other technologies that perform significantly better than the vehicle's target value are also applied.
- The quantity of vehicles produced of each model type within a manufacturer's fleet is divided by its respective fuel economy performance (mpg) including any flexibility/incentive increases; The resulting numbers for each model type are summed;
- The manufacturer's total production volume is then divided by the summed value calculated in the previous step; and

<sup>470</sup> Vehicles without tailpipe emissions, such as battery electric vehicles, have their performance measured differently, as discussed below.

<sup>471</sup> Technically, for the CAFE program, carbon-based tailpipe emissions (including CO<sub>2</sub>, CH<sub>4</sub>, and CO) are measured, and fuel economy is calculated using a carbon balance equation. EPA uses carbon-based emissions (CO<sub>2</sub>, CH<sub>4</sub>, and CO, the same as for CAFE) to calculate the tailpipe CO<sub>2</sub> equivalent for the tailpipe portion of its standards. CO<sub>2</sub> is by far the largest carbon-based exhaust constituent.

<sup>468</sup> See 49 U.S. Code 32903.6. Passenger vehicles not manufactured domestically are referenced as import passenger cars and non-passenger automobiles as light trucks.

<sup>469</sup> For readers unfamiliar with this process, the test is similar to running a car on a treadmill following a program—or more specifically, two programs. 49 U.S.C. 32904(c) states that, in testing for fuel economy, EPA must “use the same procedures for passenger automobiles [that EPA] used for model year 1975 (weighted 55 percent urban cycle and 45 percent highway cycle), or procedures that give comparable results.” Thus, the “programs” are the “urban cycle,” or Federal Test Procedure (abbreviated as “FTP”) and the “highway cycle,” or Highway Fuel Economy Test (abbreviated as “HFET”), and they have not changed substantively since 1975. Each cycle is a designated speed trace (of vehicle speed versus time) that vehicles must follow during testing—the FTP is meant roughly to simulate stop and go city driving, and the HFET is meant roughly to simulate steady flowing highway driving at about 50 mph. The 2-cycle dynamometer test results differ somewhat from what consumers will experience in the real-world driving environment because of the lack of high speeds, rapid accelerations, and hot and cold temperatures evaluations with the A/C operation. These added conditions are more so reflected in the EPA 5-cycle test results listed on each vehicle's fuel economy label and on the *fuel economy.gov* website.

• That number, which is the harmonic average of the fleet’s fuel economy, is rounded to the nearest tenth of an mpg and represents the manufacturer’s achieved fuel economy. The Base CAFE of each fleet is compared to the manufacturer’s unique fleet compliance obligation, which is calculated using the same approach as the Base CAFE performance, except that the fuel economy target value (based on

the unique footprint of each vehicle within a model type) is used instead of the measured fuel economy performance values. The fuel economy target values of the model types within each fleet and production volumes are used to derive the manufacturer’s fleet standard (also known as the obligation) which is the harmonic average of these values.

To further illustrate how Base CAFE and fuel economy targets are calculated, assume that a manufacturer produces two models of cars—a hatchback and a sedan. Figure VII–1 shows the two vehicle models imposed onto a fuel economy target function. From Figure VII–1, we can see that the target function extends from about 30 mpg for the largest cars to about 41 mpg for the smallest cars.

Figure VII-1 – Illustration of Vehicle Models vs. Fuel Economy Targets

The manufacturer’s required CAFE obligation would be determined by calculating the production-weighted harmonic average of the fuel economy target values applicable at the hatchback and sedan footprints (from the curve, about 41 mpg for the hatchback and about 33 mpg for the sedan). The manufacturer’s achieved Base CAFE level is determined by calculating the production-weighted harmonic average of the hatchback and sedan fuel economy levels (in this example the values shown in the boxes in Figure VII–1, 48 mpg for the hatchback and 25 mpg for the sedan). Depending on the relative mix of hatchbacks and sedans produced, the manufacturer’s fleet Base CAFE may be equal to the standard, perform better than the standard (if the required fleet CAFE is less than the achieved fleet Base CAFE) and thereby

earn credits, or perform worse than the standard (if the required fleet CAFE is greater than achieved fleet Base CAFE) and thereby earn a credit shortfall which would need to be made up using CAFE credits, otherwise the manufacturer would be subject to civil penalties.

As illustrated by the example, the CAFE program’s use of sales-weighted harmonic averages makes compliance more intricate than comparing a model to its target as not every model type needs to precisely meet its target for a manufacturer to achieve compliance. Consequently, if a manufacturer finds itself producing large numbers of vehicles that fall well-short of its targets, a manufacturer can attempt to equally balance its compliance by producing vehicles that are excessively over-compliant. However, NHTSA

understands that several factors determine the ability of manufacturers to change their fleet-mix mid-year. In response, the CAFE program is structured to provide relief to manufacturers in offsetting any shortfalls by offering several compliance flexibilities. Many manufacturers use these flexibilities to avoid civil penalties.

3. The Use for CAFE Compliance Flexibilities and Incentives

The CAFE program offers several compliance flexibilities which expand options for compliance, and incentives which encourage manufacturers to build vehicles with certain technologies to achieve longer range policy objectives. For example, since MY 2017, manufacturers have had the flexibility to earn credits for air conditioning

(A/C) systems with improved efficiency. These fuel economy improvements are added to the 2-cycle performance results of the vehicle and increases the calculation of a manufacturer's fleet Base CAFE in determining compliance relative to standards.<sup>472</sup>

Some CAFE flexibilities and incentives are codified by statute in EPCA or EISA, while others have been implemented by the NHTSA through regulations, consistent with the statutory scheme. Compliance flexibilities and incentives have a great deal of theoretical attractiveness: If designed properly, they can help reduce the overall regulatory costs, while maintaining or improving programmatic benefits. If designed poorly, they may create significant potential for market distortion. Consequently, creating or

revising compliance flexibilities and incentives requires proper governmental and industry collaboration for understanding upcoming technological developments and for determining whether a technology is economically feasible for compliance. When designing these programmatic elements, the agency must be mindful to ensure flexibilities and incentives are provided with long term benefits to the CAFE program while avoiding unintended windfalls for only certain manufacturers or technologies.

Compliance incentives and flexibilities are structured to encourage implementation of technology that will further increase fuel savings. Some incentives are designed to encourage the development of technologies that may have high initial costs but offer promising fuel efficiency benefits in the long-term. Others are designed to bring low cost technologies uniformly into the market that improve fuel economy in the real-world but may be missed by the 2-cycle test, such as the cost-effective off-cycle menu technologies included by EPA for CAFE compliance.

Below is a summary of all the current and proposed changes to the flexibilities and incentives for the CAFE and CO<sub>2</sub> programs in Table VII-1 through Table VII-4. Note that this proposal only covers the CAFE program; the EPA program is listed here to demonstrate the congruencies between the two programs. NHTSA is proposing to maintain the bulk of its current program with a few modifications. One of the changes raised in this proposal is to increase the off-cycle flexibility technology benefit cap along with new technology definitions as shown in the table. NHTSA is also proposing to reinstate incentives for full-size hybrid and game changing advanced technology pickup trucks for model years 2022 through 2026. NHTSA believes that these incentives will increase the production of environmentally beneficial technologies and help achieve economies of scale to reduce costs that will enable more stringent CAFE standards in the future. These proposals are explained in further detail in Section VII.B.

**BILLING CODE 4910-59-P**

<sup>472</sup> NHTSA characterizes any programmatic benefit manufacturers can use to comply with CAFE standards that fully accounts for fuel use as a "flexibility" (e.g., credit trading) and any benefit that counts less than the full fuel use as an "incentive" (e.g., adjustment of alternative fuel vehicle fuel economy). NHTSA flexibilities and incentives are discussed further in Section VII.B.3.a).

Table VII-1 – Statutory Flexibilities for Over-compliance with Standards

Regulatory Item	NHTSA		EPA	
	Authority	Current Program	Authority	Current and <i>Proposed</i> Program
Credit Earning	49 U.S.C. 32903(a)	Denominated in tenths of a mpg	CAA 202(a)	Denominated in g/mi

Starting with MY 2020, NHTSA uses the SAE defined "Utility Factor" methodology to account for actual potential use, and "F-factor" for FFV; NHTSA will continue to incorporate the 0.15 incentive factor	CAA 202(a)	Multiplier incentives for PHEVs and NGVs (each vehicle counts as 1.6/1.45/1.3 vehicles in 2017-2021 NGVs count as 2.0 vehicles in 2022-2026); electric operation = 0 g/mi through MY 2026; the SAE defined "Utility Factor" method for use, and "F-factor" for FFV <i>EPA proposes to add vehicle multiplier incentive for PHEVs; each vehicle counts as 1.6 for MYs 2022-2024, and 1.45 for MY 2025, subject to a cap on all vehicle multipliers</i>

**BILLING CODE 4910-59-C**

**4. Light Duty CAFE Compliance Data for MYs 2011–2020**

NHTSA uses compliance data in part to identify industry trends. For this proposal, NHTSA examined CAFE compliance data for model years 2011 through 2020 using final compliance data for MYs 2011 through 2017,<sup>473</sup> projections from end-of-the-model year reports submitted by manufacturers for

MYs 2018 and 2019,<sup>474</sup> and projections from manufacturers' mid model year reports for MY 2020.<sup>475</sup> Projections from the mid-year and end-of-the-model year reports may differ from EPA-verified final CAFE values either because of differing test results or final sales-volume figures. MY 2011 was selected as the start of the data because it represents the first compliance model year for which manufacturers were

permitted to trade and transfer credits.<sup>476</sup> The data go up to MY 2020, because this was the most recent year compliance reports were available.

Figure VII-2 through Figure VII-5 provide a graphical overview of the actual and projected compliance data for MYs 2011 to 2020.<sup>477</sup>

In the figures, an overview is provided for the total fuel economy performance of the industry (the combination of all passenger cars and light trucks produced for sale during the

<sup>473</sup> Final compliance data have been verified by EPA and are published on the NHTSA's Public Information Center (PIC) site. MY 2017 is currently the most-recent model year verified by EPA.

<sup>474</sup> MY 2018 data come from information received in manufacturers' final reports submitted to EPA according to 40 CFR 600.512-12.

<sup>475</sup> Manufacturers' mid-model year CAFE reports are submitted to NHTSA in accordance with 49 CFR part 537. At the time of the analysis, end of the model year data had not yet been submitted for MY 2020.

<sup>476</sup> 49 CFR 535.6(c).

<sup>477</sup> As mentioned previously, the figures include estimated values for certain model years based on the most up to date information provided to NHTSA from manufacturers.

model year) as a single fleet, and for each of the three CAFE compliance fleets: Domestic passenger car, import passenger car, and light truck fleets. For each of the graphs, a sale-production weighting is applied to determine the average total or fleet Base CAFE performances.<sup>478 479 480</sup> The graphs do not include adjustments for full-size pickup trucks because manufacturers have yet to bring qualifying products into production.

The figures also show how many credits remain in the market each model year. One complicating factor for presenting credits is that the mpg-value of a credit is contingent where it was earned and applied. Therefore, the actual use of the credits for MYs 2018 and beyond will be uncertain until compliance for those model years is completed. Also, since credits can be

<sup>478</sup> In the figures, the label “2-Cycle CAFE” represents the maximum increase each year in the average fuel economy set to the limitation “cap” for manufacturers attributable to dual-fueled automobiles as prescribed in 49 U.S.C. 32906. The label “AC/OC contribution” represents the increase in the average fuel economy adjusted for A/C and off-cycle fuel consumption improvement values as prescribed by 40 CFR 600.510–12.

<sup>479</sup> Consistent with applicable law, NHTSA established provisions starting in MY 2017 allowing manufacturers to increase compliance performance based on fuel consumption benefits gained by technologies not accounted for during normal 2-cycle EPA compliance testing (called “off-cycle technologies” for technologies such as stop-start systems) as well as for A/C systems with improved efficiencies and for hybrid or electric full-size pickup trucks.

<sup>480</sup> Adjustments for earned credits include those that have been adjusted for fuel saving using the manufacturers CAFE values for the model years in which they were earned and adjusted to the average CAFE values for the fleets they exist within.

retained for up to 6 MYs after they were earned or applied retroactively to the previous 3 model years, it is impossible to know the final application of credits for MY 2020 until MY 2023 compliance data are finalized. Instead of attempting to project how credits would be generated and used, the agency opted to value each credit based on its actual value when earned, by estimating the value when applied assuming it was applied to the overall average fleet and across all vehicles. In the figures, two different approaches were used to represent the mpg value of credits used to offset shortages (shown as CAFE after credit allocation in the figures). The mpg shortages for MYs 2011 to 2017 are based upon actual compliance values from EPA and the credit allocations or fines manufacturers instructed NHTSA to adjust and apply to resolve compliance shortages. For MYs 2018 to 2020, NHTSA used a different approach for representing the mpg shortages, deriving them from projected estimates adjusted for fuel savings calculated from the projected fleet average performances and standards for each model year and fleet. To represent the mpg value of manufacturers’ remaining banked credits in the figures (shown as Credits in the Market) the same weighting approach was also applied to these credits based upon the fleet averages. For MYs 2011–2017, the remaining banked credits include those currently existing in manufacturers’ credit accounts adjusted for fuel savings and subtracting any expired credits for each year. This approach was taken to represent these credits for the actual value that would likely exist if the

credits were applied for compliance purposes. Without adjusting the banked credits, it would provide an unrealistic value of the true worth of these credits when used for compliance. For MYs 2018–2020, the mpg value of the remaining banked credits is shown slightly differently where the value represents the difference between the adjusted credits carried forward from previous model years (minus expiring credits) and the projected earned credits minus any expected credit shortages. Since all the credits in these model years were adjusted using the same approach it was possible to subtract the credit amounts. However, readers are reminded that for MYs 2018–2020 since the final CAFE reports have yet to be issued, the credit allocation process has not started, and the data shown in the graphs are a projection of potential overall compliance. Consequently, the credits included for MYs 2018–2020 are separated from earlier model years by a dashed line to highlight that there is a margin of uncertainty in the estimated values. Projecting how and where credits will be used is difficult for a number of reasons such as not knowing which flexibilities manufacturers will utilize and the fact that credits are not valued the same across different fleets. As such, the agency reminds readers that the projections may not align with how manufacturers will actually approach compliance for these years.

Table VII–5 provides the numerical CAFE performance values and standards for MYs 2011–2020 as shown in the figures.

**BILLING CODE 4910–59–P**

2014	36.3	34	36.9	34.6	26.5	26.3	31.7	30.5
2013	36.1	33.2	36.8	33.9	25.7	25.9	31.6	30.3
2012	34.8	32.7	36	33.4	25	25.3	30.8	29.8
2011	32.7	30	33.7	30.4	24.7	24.3	29	27.4

**BILLING CODE 4910-59-C**

As shown in Figure VII-2, manufacturers’ fuel economy performance (2-cycle CAFE plus AMFA) for the total fleet was better than the fleet-wide target through MY 2015. On average, the total fleet exceeded the standards by approximately 0.9 mpg for MYs 2011 to 2015. As shown in Figure VII-3 through Figure VII-5, domestic and import passenger cars exceeded standards on average by 2.1 mpg and 2.3 mpg, respectively. By contrast, light truck manufacturers on average fell below the standards by 0.3 mpg over the same time period.

For MYs 2016 through 2020, Figure VII-2 shows that the total fleet Base CAFE (including 2-Cycle CAFE plus A/C and OC benefits) falls below and appears to remain below the fleet CAFE standards for these model years.<sup>481</sup> The projected compliance shortfall (*i.e.* the difference between CAFE performance values and the standards) remains constant and reaches its greatest difference between MYs 2019 and 2020. Compliance becomes even more complex when observing individual compliance fleets over these years. Only domestic passenger car fleets collectively appear to exceed CAFE standards while import passenger car fleets appear to have the greatest compliance shortages. In MY 2020, the import passenger car fleet appear to

reach its highest compliance shortfall equal to 3.3 mpg.

The graphs provide an overall representation of the average values for each fleet, although they are less helpful for evaluating compliance with the minimum domestic passenger car standards given statutory prohibitions on manufacturers using traded or transferred credits to meet those standards.<sup>482</sup> Consequently, in MY 2020, domestic passenger car manufacturers may improve their performance by adding more AC/OC technology, allowing the domestic passenger car fleet to once again exceed CAFE standards. However, NHTSA notes that several manufacturers have already reported insufficient earned credits and may have to make fine payments if they fail to reach the minimum domestic passenger car standards.

In summary, MY 2016 is the last compliance model year that passenger cars complied with CAFE standards relying solely on Base CAFE performance. Prior to this timeframe, passenger car manufacturers especially those building domestic fleets could substantially exceed CAFE standards. MY 2016 marked the first time in the history of the CAFE program where compliance for passenger car manufacturers fell below standards thereby increasing shortfalls and forcing the need for manufacturers to rely

heavily upon credit flexibilities. Despite higher shortfalls, domestic passenger car manufacturers have continued to generate credits and increase their total credit holdings. The projections show that for MYs 2018–2020, domestic passenger car fleets will transition from generating to using credits but will maintain sizable amounts of banked credits sufficient to sustain compliance shortfalls in other regulatory fleets. Figure VII-4 shows residual available banked credits even as far as MY 2020. Domestic passenger car credits and their off-cycle credits will play an important role in sustaining manufacturers in complying with CAFE standards.

From the projections, it appears that based on the number of remaining domestic passenger credits in the market and the rate at which they are being used, there will be insufficient credits to cover the shortfalls in other compliance fleets in years following MY 2020. Figure VII-2 shows that the total remaining combined credits for the industry is expected to decline starting in MY 2018. Import passenger cars and light truck fleets will play a major role in the decline and possible depletion of all available credits to resolve shortfalls after MY 2020. Several factors exist that could produce this outcome. First, increasing credit shortages are occurring in the import passenger car and light truck fleets especially since the reduction and then termination of AMFA incentives in MY 2019 (a major contributor for light trucks). Next, residual banked credits for the light truck fleet are expected to be exhausted starting in MY 2018 and for import

<sup>481</sup> Until MY 2023 compliance, the last year where earned credits can be retroactively applied to MY 2020, NHTSA will be unable to make a determination about the fleet’s overall compliance over this timespan.

<sup>482</sup> In accordance with 49 CFR 536.9(c), transferred or traded credits may not be used, pursuant to 49 U.S.C. 32903(g)(4) and (f)(2), to meet the domestically manufactured passenger automobile minimum standard specified in 49 U.S.C. 32902(b)(4) and in 49 CFR 531.5(d).

passenger cars in MY 2020. Finally, the use of AC/OC benefits for import passenger cars and lights trucks is not a significant factor for these fleets in complying with CAFE standards. Manufacturers will need to change their production strategies or introduce substantially more fuel saving technologies to sustain compliance in the future.

Figure VII–6 provides a historical overview of the industry’s use of CAFE credit flexibilities and fine payments for addressing compliance shortfalls.<sup>483</sup> As mentioned, MY 2017 is the last model year for which CAFE compliance determinations are completed, and credit application and civil penalty payment determinations finalized. As shown in the figure, for MYs 2011–2015, manufacturers generally resolved credit shortfalls by carrying forward earned credits from previous years. However, since 2011, the rise in manufacturers executing credit trades has become increasingly common and, in MY 2017, credit trades were the most frequently used flexibility for achieving compliance. Credit transfers have also become increasingly more prevalent for manufacturers. As a note to readers, credit trades in the figures can also involve credit transfers but are aggregated in the figure as credit trades to simplify results. In MY 2016, credit transfers constituted the highest contributor to credit flexibilities but are

<sup>483</sup> The Figure includes all credits manufacturers have used in credit transactions to date. Credits contained in carryback plans yet to be executed or in pending enforcement actions are not included in the Figure.

starting to decline signifying that manufacturers are currently exhausting credit transfers within their own fleets. Manufacturers only occasionally carry back credits to resolve performance shortfalls. NHTSA believes that trading credits between manufacturers and to some degree transferring traded credit across fleets will be the most commonly used flexibility in complying with future CAFE standards as started in MY 2017.

Credit trading has generally replaced civil penalty payments as a compliance mechanism. Only a handful of manufacturers have made civil penalty payments since the implementation of the credit trading program. As previously shown, NHTSA believes that manufacturers have sufficient credits to resolve any import passenger car and light truck performance shortfalls expected through MY 2020. As of recent, the only fine payments being made or expected in the future are those directly resulting from manufacturers failing to comply with the minimum domestic passenger car standards.<sup>484</sup> There were two fine payments made in MYs 2016 and 2017 which fit this exact case. By statute, manufacturers cannot use traded or transferred credits to address performance shortfalls for failing to meet the minimum domestic

<sup>484</sup> Six manufacturers have paid CAFE civil penalties since credit trading began in 2011. Fiat Chrysler paid the largest civil penalty total over the period, followed by Jaguar Land Rover and then Volvo. See Summary of CAFE Civil Penalties Collected, CAFE Public Information Center, [https://one.nhtsa.gov/cafe\\_pic/CAFE\\_PIC\\_Fines\\_LIVE.html](https://one.nhtsa.gov/cafe_pic/CAFE_PIC_Fines_LIVE.html).

passenger car standards.<sup>485</sup> Because of this limitation, the fine payments made in MY 2016 and 2017 came from one manufacturer that had exhausted all of its earned domestic passenger credits and could not carryback future credits.<sup>486</sup> The same condition will occur for other manufacturers in the future. NHTSA calculates that six manufacturers will meet this same condition and have to make substantial civil penalty payments for failing to comply with the minimum domestic passenger cars standards in MYs 2018 through 2020.

In Figure VII–8, additional information is provided on the credit flexibilities exercised and fine payments made by manufacturers for MYs 2011–2017. The figure includes the gasoline gallon equivalent for these credit flexibilities or for paying civil penalties. The figure shows that manufacturers used carrying forward credits most often to resolve shortfalls. Credit trades were the second leading benefit to manufacturers in using credit flexibilities and then followed by credit transfers. In summary, manufacturers used these flexibilities amounting to the equivalent of 2,952,856 gallons of fuel by carrying forward credits in 2017 and 583,720 gallons of fuel by trading credits in 2017.

<sup>485</sup> Congress prescribed minimum domestic passenger car standards for domestic passenger car manufacturers and unique compliance requirements for these standards in 49 U.S.C. 32902(b)(4) and 32903(f)(2).

<sup>486</sup> Fiat Chrysler paid \$77,268,702.50 in civil penalties for MY 2016 and \$79,376,643.50 for MY 2017 for failing to comply with the minimum domestic passenger car standards for those MYs.

Figure VII-6 – Industry Use of Compliance Flexibilities and Civil Penalty Payments<sup>487</sup>

<sup>487</sup> For Figure VII-6; in each year some flexibilities were not utilized by manufacturers. For

example, carry backed credits were not utilized in 2011, 2013, 2014, 2015, 2016, or 2017. Transfer

credits were not used in 2011, 2012 or 2013. No civil penalties were paid in 2015.

**Figure VII-7 – Value of Applied Credit Flexibilities and Civil Penalty Payments in Gallons**

Despite this compliance picture, NHTSA's analysis supporting this NPRM shows some amount of overcompliance in the baseline/No-Action Alternative for the model years subject to this proposal. This modeled overcompliance occurs due to assumptions about a variety of factors, including (1) a number of manufacturers voluntarily binding themselves to the California Framework Agreements, (2) expected manufacturer compliance with California's ZEV program, (3) expected manufacturer compliance with the EPA GHG and NHTSA CAFE standards finalized in 2020, (4) a small amount of market demand for increased fuel economy (due mostly to projected fuel prices), (5) the projected affordability of applying certain technologies that are eligible for compliance boosts (like off-cycle adjustments), and so on. If these assumptions do not come to pass in the real world, the difference between the compliance picture over the last several model years and the one shown in the analysis for the next several years would accordingly be smaller. Overcompliance with the regulatory alternatives is much lower than what was shown in the NPRM that preceded the 2020 final rule

and is highly manufacturer-dependent. NHTSA seeks comment on the amount of overcompliance with the regulatory alternatives shown, if any, in light of how the agency has described its modeling approach for this proposal.

#### 5. Shift in Sales Production From Passenger Cars to Light Trucks

The apparent stagnant growth in the automotive industry's CAFE performance is likely related to a relative decrease in the share of passenger cars, where manufacturers made the most gains in fuel economy performance combined with an increase in the relative share of light trucks purchased beginning with MY 2013. Light trucks experienced sharp increases in sales, increasing by a total of 5 percent from MYs 2013 to 2014. In MY 2014, light trucks comprised approximately 41 percent of the total sales production volume of automobiles and has continued to grow ever since. In comparison, for model year 2014, domestic passenger cars represented 36 percent of the total fleet and import passenger cars represented 23 percent. Both domestic and import passenger car sales have continued to fall every year

since MY 2013. Figure VII-8 shows the sales production volumes of light trucks and domestic and import passenger cars for MYs 2004 to 2020. Historically, light truck fleets have fallen below their associated CAFE standards and have had larger performance shortages than either import and domestic passenger car fleets. For MY 2020, NHTSA expects even greater CAFE performance shortages in the light truck and import passenger car fleets than in prior model years, based upon manufacturer's mid-model year (MMY) reports. MY 2020 light trucks are expected to comprise approximately 53 percent of the total. As mentioned previously, the combined effect of these fuel economy shortages will likely require manufacturers to rely on compliance flexibilities or pay civil penalties.

Out of 25 vehicle types listed in the EPA database, 5 vehicle types—namely compact cars, midsize cars, small and standard SUVs with 4WD, and standard pickup trucks with 4WD have the highest volumes of vehicles produced for sale in MYs 2012 to 2017. From 2012 to 2020, there was a drastic decrease of 24% and 17% in the production of compact cars and midsize cars,

respectively. On the other side, there was a significant increase in the production of 4WD small and standard equaling approximately 41% collectively of all sales. Standard pickup trucks with 4WD experienced little change in the production volume throughout the years. As shown in Figure VII-9, small SUVs, with 4WD and 2WD drivetrains, have surpassed the sales production volumes of all

other vehicle types over these the given model years. The number of small and standard SUVs sold in the U.S. for MY 2017 nearly doubled compared to sales in the U.S. for MY 2012. During that same period, passenger car sales production as a total of vehicle sales production decreased by approximately 11 percent. The combination of low gas prices and the increased utility that SUVs provide, along with aggressive

manufacturer marketing, may explain the shift in sales production. Nonetheless, if the sales of these small SUVs and pickup trucks continue to increase, there may be continued stagnation in the CAFE performance of the overall fleet unless manufacturers respond with greater adoption of fuel economy technology in the SUV and pickup truck portion of their fleets.

Figure VII-8 – Sales Production Volumes for MYs 2004 to 2020

Figure VII-9 – Change in Major Vehicle Type Production from 2012-2017

6. Electrification

According to data submitted to EPA and NHTSA for MYs 2012 through 2017, the population of electrified

vehicles in the passenger car fleet has steadily increased. The percentage of petroleum-based passenger cars in the market has decreased. While the

nominal amount of electric light trucks has increased, the percentage of electric light trucks has decreased due to petroleum-based light trucks growing at

a faster rate. All electric passenger cars account for up to 3 percent of the total production of light-duty vehicles each year. In comparison, all electric light trucks account for about 0.2 percent of

the total fleet each year. The number of passenger cars using alternative fuels has also steadily increased while the population of alternative fuel light trucks has become non-existent.

However, comparing the total fleet, the population of electric and hybrid vehicles is steadily increasing each year on average.

Despite the small market share currently for electric and hybrid trucks, manufacturers are making a strong effort to grow this market. Starting in 2020, several manufacturers introduced several new models of hybrid and PEV SUVs and crossovers.

NHTSA is considering new CAFE compliance strategies for electric pickup trucks in this rulemaking. EPA and NHTSA previously provided

<sup>488</sup> 49 U.S. Code 538 discusses Flexible Fuel Vehicle.

<sup>489</sup> Definition of Electricity/Hybrids can be found in 49 U.S. Code 523.2.

<sup>490</sup> If the fuel type is marked as Hybrid, for this table the vehicles are automatically counted as Hybrid no matter what type of fuel category they have. Flexible Fuel Vehicle is everything else except where the fuel type is gasoline and electric/hybrid.

<sup>491</sup> Complete data is only available through MY 2017.

flexibilities for hybrid and electric pickup trucks adopted under the 2017–2025 CAFE and GHG final rule issued in 2012. These flexibilities would have provided manufacturers with an incentive through MY 2025 to build additional electric pickup trucks but in the 2020 final rule, NHTSA and EPA decided to terminate these incentives early. Further discussion of NHTSA’s and EPA’s incentive programs for hybrid and electric pickup trucks is presented in Section B.3.e)(1). As a part of the section, a new proposal is also included for EPA and NHTSA to reconsider extending the incentives for pickup trucks back to their original effective date ending in MY 2025.

#### 7. Vehicle Classification

Vehicle classification, for purposes of the light-duty CAFE program, refers to

whether an automobile qualifies as a passenger automobile (car) or a non-passenger automobile (light truck). Passenger cars and light trucks are subject to different fuel economy standards as required by EPCA/EISA and consistent with their different capabilities.

Vehicles are designated as either passenger automobiles or non-passenger automobiles. Vehicles “capable of off-highway operation” are, by statute, non-passenger automobiles.<sup>492</sup> Determining “off-highway operation” was left to NHTSA, and currently is a two-part inquiry: First, does the vehicle either have 4-wheel drive or over 6,000 pounds gross vehicle weight rating (GVWR), and second, does the vehicle have a significant feature designed for

<sup>492</sup> 49 U.S. Code 32902.

off-highway operation.<sup>493</sup> NHTSA's regulation on vehicle classification contain requirements for vehicles to be classified as light trucks either on the basis of off-highway capability or on the basis of having "truck-like characteristics." Over time, NHTSA has refined the light truck vehicle classification by revising its regulations and issuing legal interpretations. However, based on the increase in crossover SUVs and advancements in vehicle design trends, NHTSA has become aware of vehicle designs that complicate classification determinations for the CAFE program. Throughout the past decade, NHTSA has identified these changes in compliance testing, data analysis, and has discussed the trend in rulemakings, publications, and with stakeholders.

NHTSA believes that an objective procedure for classifying vehicles is paramount to the agency's continued oversight of the CAFE program. When there is uncertainty as to how vehicles should be classified, inconsistency in determining manufacturers' compliance obligations can result, which is detrimental to the predictability and fairness of the program. In the 2020 final rule, NHTSA attempted to resolve several classification issues and committed to continuing research to resolve others. NHTSA notified the public of its plans to develop a compliance test procedure for verifying manufacturers' submitted classification data. An objective standard would help avoid manufacturers having to reclassify their vehicles, improve consistency and fairness across the industry, and introduce areas within the criteria where uncertainties existed and research could be conducted in the near future to resolve.

In this rulemaking, NHTSA is providing additional classification guidance and seeking comments on several unknown aspects needed to develop its compliance test procedure. Based upon the comments received to this NPRM, NHTSA plans to release its draft test procedure later this year. No changes are being made in this rulemaking that will change how vehicles are classified.

#### (a) Clarifications for Classifications Based Upon "Off-Road Capability"

For a vehicle to qualify as off-highway (off-road) capable, in addition to either having 4WD or a GVWR more than 6,000 pounds. The vehicle must have four out of five characteristics indicative of off-highway operation. These characteristics are:

- An approach angle of not less than 28 degrees
- A breakover angle of not less than 14 degrees
- A departure angle of not less than 20 degrees
- A running clearance of not less than 20 centimeters
- Front and rear axle clearances of not less than 18 centimeters each

#### (1) Production Measurements

NHTSA's regulations require manufacturers to measure vehicle characteristics when a vehicle is at its curb weight, on a level surface, with the front wheels parallel to the automobile's longitudinal centerline, and the tires inflated to the manufacturer's recommended cold inflation pressure.<sup>494</sup> NHTSA clarified in the 2020 final rule that 49 CFR part 537 requires manufacturers to classify vehicles for CAFE based upon their physical production characteristics. The agency verifies reported values by measuring production vehicles. Manufacturers must also use physical vehicle measurements as the basis for values reported to the agency for purposes of vehicle classification. It may be possible for certain vehicles within a model type to qualify as light trucks while others would not because of their production differences. Since issuing the 2020 final rule, NHTSA has met with manufacturers to reinforce the use of production measurements and clarifying here that manufacturers are only required to report classification information for those physical measurements used for qualification and can omit other measurements.

In the previous rulemaking, NHTSA also identified that certain vehicle designs incorporate rigid (*i.e.*, inflexible) air dams, valance panels, exhaust pipes, and other components, equipped as manufacturers' standard or optional equipment (*e.g.*, running boards and towing hitches), that likely do not meet the 20-centimeter running clearance requirement. Despite these rigid features, some manufacturers are not taking these components into consideration when making classification decisions. Additionally, other manufacturers provide dimensions for their base vehicles without considering optional or various trim level components that may reduce the vehicle's ground clearance. Consistent with our approach to other measurements, NHTSA believes that ground clearance, as well as all the other off-highway criteria for a light truck determination, should use the

measurements from vehicles with all standard and optional equipment installed, at the time vehicles are shipped to dealerships. These views were shared by manufacturers in response to the previous CAFE rulemaking.

The agency reiterates that the characteristics listed in 49 CFR 523.5(b)(2) are characteristics indicative of off-highway capability. A fixed feature—such as an air dam that does not flex and return to its original state or an exhaust that could detach—inherently interferes with the off-highway capability of these vehicles. If manufacturers seek to classify vehicles as light trucks under 49 CFR 523.5(b)(2) and the vehicles have a production feature that does not meet the four remaining characteristics to demonstrate off-highway capability, they must be classified as passenger cars. NHTSA also clarifies that vehicles that have adjustable ride height, such as air suspension, and permit variable on-road or off-road running clearances should be classified based upon the mode most commonly used or the off-road mode for those with this feature. NHTSA seeks comments on how to define the mode most commonly used for any adjustable suspensions. For the test procedure, would it be more appropriate to allow manufacturers to define the mode setting for vehicles with adjustable suspensions?

#### (2) Testing for Approach, Breakover, and Departure Angles

Approach angle, breakover angle, and departure angle are relevant to determine off-highway capability. Large approach and departure angles ensure the front and rear bumpers and valance panels have sufficient clearance for obstacle avoidance while driving off-road. The breakover angle ensures sufficient body clearance from rocks and other objects located between the front and rear wheels while traversing rough terrain. Both the approach and departure angles are derived from a line tangent to the front (or rear) tire static loaded radius arc extending from the ground near the center of the tire patch to the lowest contact point on the front or rear of the vehicle. The term "static loaded radius arc" is based upon the definitions in SAE J1100 and J1544.<sup>495</sup> The term is defined as the distance from wheel axis of rotation to the supporting surface (ground) at a given load of the vehicle and stated inflation pressure of

<sup>493</sup> 49 U.S. Code 523.5(A)(5)(ii)(b).

<sup>494</sup> 49 U.S. Code 523.5(A)(5).

<sup>495</sup> See SAE J1100 published on May 26, 2012 and SAE J1544 published on Oct 25, 2011.

the tire (manufacturer's recommended cold inflation pressure).

The static loaded radius arc is easy to measure, but the imaginary line tangent to the static loaded radius arc is difficult to ascertain in the field. The approach and departure angles are the angles between the line tangent to the static loaded radius arc and the level ground on which the test vehicle rests. For the compliance test procedure, a substitute measurement will be used. A measurement that provides a good approximation of the approach and departure angles involve using a line tangent to the outside diameter or perimeter of the tire and extends to the lowest contact point on the front or rear of the vehicle. This approach provides an angle slightly greater than the angle derived from the true static loaded radius arc. The approach also has the advantage to allow measurements to be made quickly for measuring angles in the field to verify data submitted by the manufacturers used to determine light truck classification decisions. In order to comply, the vehicle measurement must be equal to or greater than the required measurements to be considered as compliant and if not, the reported value will require an investigation which could lead to the manufacturer's vehicle becoming reclassified as a passenger car.

### (3) Running Clearance

NHTSA regulations define "running clearance" as "the distance from the surface on which an automobile is standing to the lowest point on the automobile, excluding unsprung weight." Unsprung weight includes the components (*e.g.*, suspension, wheels, axles, and other components directly connected to the wheels and axles) that are connected and translate with the wheels. Sprung weight, on the other hand, includes all components fixed underneath the vehicle that translate with the vehicle body (*e.g.*, mufflers and subframes). To clarify these requirements, NHTSA previously issued a letter of interpretation stating that certain parts of a vehicle—such as tire aero deflectors that are made of flexible plastic, bend without breaking, and return to their original position—would not count against the 20-centimeter running clearance requirement. The agency explained that this does not mean a vehicle with less than 20 centimeters running clearance could be elevated by an upward force that bends the deflectors and still be considered compliant with the running clearance criterion, as it would be inconsistent with the conditions listed in the introductory paragraph of 49 CFR

523.5(b)(2). Further, NHTSA explained that without a flexible component installed, the vehicle must meet the 20-centimeter running clearance requirement along its entire underside. This 20-centimeter clearance is required for all sprung weight components. For its compliance test procedure, NHTSA will include a list of the all the components under the vehicle considered as unsprung components. NHTSA will update the list of unsprung components as the need arises.

### (4) Front and Rear Axle Clearance

NHTSA regulations state that front and rear axle clearances of not less than 18 centimeters are another criterion that can be used for designating a vehicle as off-highway capable.<sup>496</sup> The agency defines "axle clearance" as the vertical distance from the level surface on which an automobile is standing to the lowest point on the axle differential of the automobile.

The agency believes this definition may be outdated because of vehicle design changes, including axle system components and independent front and rear suspension components. In the past, traditional light trucks with and without 4WD systems had solid rear axles with center-mounted differential on the axle. For these trucks, the rear axle differential was closer to the ground than any other axle or suspension system component. This traditional axle design still exists today for some trucks with a solid chassis (also known as body-on-frame configuration). Today, however, many SUVs and CUVs that qualify as light trucks are constructed with a unibody frame and have unsprung (*e.g.*, control arms, tie rods, ball joints, struts, shocks, etc.) and sprung components (*e.g.*, the axle subframes) connected together as a part of the axle assembly. These unsprung and sprung components are located under the axles, making them lower to the ground than the axles and the differential, and were not contemplated when NHTSA established the definition and the allowable clearance for axles. The definition also did not originally account for 2WD vehicles with GVWRs greater than 6,000 pounds that had one axle without a differential, such as the model year 2018 Ford Expedition. Vehicles with axle components that are low enough to interfere with the vehicle's ability to perform off-road would seem inconsistent with the regulation's intent of ensuring off-highway capability.

In light of these issues, for the compliance test procedure, NHTSA will

ask manufacturers to identify those axle components that are sprung or unsprung and provide sufficient justification as a part of the testing setup request forms sent to manufacturers before testing. In addition, for vehicles without a differential, NHTSA will request the location each manufacturer used to establish its axle clearance qualification. NHTSA will validate the location specified by the manufacturer but will challenge any location on the vehicle's axle found to be located at a lower elevation to the ground than the designed location of its axle clearance measurement.

### (5) 49 CFR 571.3 MPV Definition

The definition for multipurpose passenger vehicle (MPV) is defined as a "a motor vehicle with motive power, except a low-speed vehicle or trailer, designed to carry 10 persons or less which is constructed either on a truck chassis or with special features for occasional off-road operation."<sup>497</sup> The regulation is silent, however, in defining special features for occasional off-road operation are qualified. In a letter of interpretation dated May 31, 1979, the agency responded to a question from Subaru requesting the agency's opinion whether a four-wheel drive hatchback sedan could be classified as an MPV. NHTSA responded stating that the agency interprets the definition as requiring that the vehicle contain more than a single feature designed for off-road use and that four-wheel drive would be useful in snow on public streets, roads and highways, so this feature cannot be determinative of the vehicle's classification if there are no features for off-road use. The interpretation also stated that Subaru needed to provide additional information (including, but not limited to, pictures or drawings of the vehicle) concerning other special features of the vehicle that would make it suitable for off-road operation. Finally, the interpretation referenced 49 CFR 523.5(b)(2) for a description of some of the characteristics that would be considered "special features" for off-road operation although that section relates primarily related to fuel economy. Considering that the definition for MPVs does not list the "special features," NHTSA is seeking comment on whether manufacturers use "special features" other than those in 49 CFR 523.5(b)(2) to qualify vehicles as MPVs. Should NHTSA link the definition of MPV in 49 CFR 571.3 (as it relates to special features for occasional off-road operation) to 49 CFR

<sup>496</sup> 49 U.S. Code 523.5(b)(2).

<sup>497</sup> 49 CFR 571.3.

523.5(b)(2)? What drawbacks exist in linking both provisions? Using the longstanding off-road features for fuel economy provides could clarify the means for certifying that a vehicle meets the definition for MPV in 571.3 when manufacturers may otherwise be uncertain as to how to classify a vehicle.

### B. Complying With the NHTSA CAFE Program

#### 1. Annual Compliance Process

Manufacturers' production decisions drive the mixture of automobiles on the road. Manufacturers largely produce a mixture of vehicles both to influence and meet consumer demand and address compliance with CAFE standards through the application of fuel economy improving technologies to those vehicles, and by using compliance flexibilities and incentives that are available in the CAFE program. As discussed earlier in this NPRM, each vehicle manufacturer is subject to separate CAFE standards for passenger cars and light trucks, and for the passenger car standards, a manufacturer's domestically-manufactured and imported passenger car fleets are required to comply separately.<sup>498</sup> Additionally, domestically-manufactured passenger cars are subject to a statutory minimum standard. Some CAFE program flexibilities are described by statute. Other flexibilities are established by NHTSA through regulation in accordance with the EPCA and EISA, such as fuel economy improvements for air conditioning efficiency, off-cycle, and pickup truck advanced technologies that are not expressly specified by CAFE statute, but are implemented consistent with EPCA's provisions regarding the calculation of fuel economy authorized for EPA.

Compliance with the CAFE program begins each year with manufacturers submitting required reports to NHTSA in advance and during the model year that contain information, specifications, data, and projections about their fleets.<sup>499</sup> Manufacturers report early product projections to NHTSA describing their efforts to comply with CAFE standards per EPCA's reporting requirements.<sup>500</sup> Manufacturers' early projections are required to identify any of the flexibilities and incentives manufacturers plan to use for air-conditioning (A/C) efficiency, off-cycle and, through MY 2021, which this action proposes to extend through MY

2026, full-size pickup truck advanced technologies. EPA consults with NHTSA when reviewing and considering manufacturers' requests for fuel consumption improvement values for A/C and off-cycle technologies that improve fuel economy. NHTSA evaluates and monitors the performance of the industry using compliance data. NHTSA also audits manufacturers' projected data for conformance and verifies vehicle conformance through measurements (e.g., vehicle footprints) to ensure manufacturers are complying. After the model year ends, manufacturers submit final reports to EPA, that include final information on all the flexibilities and incentives allowed or approved for the given model year.<sup>501</sup> EPA then verifies manufacturers' reported information and values and calculates the final fuel economy level of each fleet produced by each manufacturer, and transmits that information to NHTSA.<sup>502</sup>

In previous years, the normal processes for CAFE compliance between NHTSA and EPA have been effective at administering the CAFE program for decades. EPA sends NHTSA its final CAFE results usually between November to December after the given model year. In recent years, this process has been disrupted by manufacturers submitting requests for A/C and off-cycle benefits during the model year and at times well after the end of the model year. As EPA cannot finalize CAFE results until all A/C and off-cycle credits for a model year are accounted for, the belated submissions have significantly delayed NHTSA receiving final CAFE results for many manufacturers. Late submissions place significant burdens on the agencies and complicate administering the CAFE program, including delaying the exchange and use of credits. In the following sections, NHTSA discusses the adverse impacts on the CAFE program resulting from late and retro-active A/C and off-cycle requests and proposes regulatory modifications to mitigate late submissions and help expedite processes for future off-cycle requests.

<sup>501</sup> For example, alternative fueled vehicles get special calculations under EPCA (49 U.S.C. 32905–06), and fuel economy levels can also be adjusted to reflect air conditioning efficiency and “off-cycle” improvements.

<sup>502</sup> 49 U.S.C. 32904(c)–(e). EPCA granted EPA authority to establish fuel economy testing and calculation procedures; EPA uses a two-year early certification process to qualify manufacturers to start selling vehicles, coordinates manufacturer testing throughout the model year, and validates manufacturer-submitted final test results after the close of the model year.

After receiving EPA's final reports, NHTSA completes the remainder of its compliance processes for manufacturers usually one to three months after receiving EPA's final reports. The process starts with NHTSA using EPA's final verified information to determine the CAFE standard for each of the manufacturer's fleets, and each fleet's compliance level. Those results are then used to determine credits, credit shortfalls and credit balances, and NHTSA sends letters to manufacturers stating the outcome of that assessment. Credit shortfall letters specify the obligated credit deficiency a manufacturer must resolve to comply with the applicable CAFE standard for the given model year. Credit balance letters specify the official balance of credits NHTSA has allotted to the manufacturer in each of its credit accounts and a ledger of the credit transactions the manufacturer has executed. Upon receipt of NHTSA's compliance letters, manufacturers are required to submit plans explaining how they plan to resolve any shortfalls. NHTSA periodically releases data and reports to the public through its CAFE Public Information Center (PIC) based on information in the EPA final reports for the given compliance model year and based on the projections manufacturers provide to NHTSA for the next two model years.<sup>503</sup>

Some flexibilities are defined, and sometimes limited by statute—for example, while Congress allowed manufacturers to transfer credits earned for over-compliance from their car fleet to their truck fleet and vice versa, Congress also limited the amount by which manufacturers could increase their CAFE levels using those transfers.<sup>504</sup> Consistent with the limits Congress placed on certain statutory flexibilities and incentives, NHTSA crafted and implemented credit transfer and trading regulations authorized by EISA ensure that total fuel savings are preserved when manufacturers exercise statutory compliance flexibilities required by statute.

NHTSA and EPA have previously developed other compliance flexibilities and incentives for the CAFE program consistent with the statutory provisions regarding EPA's calculation of manufacturers' fuel economy levels. As discussed previously, NHTSA finalized in the 2012 final rule an approach for manufacturers' “credits” under EPA's program to be applied as fuel economy

<sup>503</sup> The NHTSA Public Information Center (PIC) is located at [https://one.nhtsa.gov/cape\\_pic/CAFE\\_PIC\\_Home.htm](https://one.nhtsa.gov/cape_pic/CAFE_PIC_Home.htm).

<sup>504</sup> See 49 U.S.C. 32903(g).

<sup>498</sup> 49 U.S.C. 32904(b).

<sup>499</sup> 49 U.S.C. 32907(a); 49 CFR 537.7.

<sup>500</sup> 49 U.S.C. 32907(a).

“adjustments” or “improvement values” under NHTSA’s program for: (1) Technologies that cannot be measured or cannot be fully measured on the 2-cycle test procedure, *i.e.*, “off-cycle” technologies; and (2) A/C efficiency improvements that also improve fuel economy but cannot be measured on the 2-cycle test procedure. Additionally, both agencies’ programs give manufacturers compliance incentives through MY 2021, and proposed to be extended to MY 2026 in this NPRM, for utilizing specified technologies on full-size pickup trucks, such as hybridization, or full-size pickup trucks that overperform their fuel economy stringency target values by greater than a specified amount.

The following sections outline how NHTSA determines whether manufacturers are in compliance with CAFE standards for each model year, and how manufacturers may use compliance flexibilities, or alternatively address noncompliance through civil penalties. Moreover, it explains how manufacturers submit data and information to the agency. This includes a detailed discussion of NHTSA’s standardized CAFE reporting template adopted as a part of the 2020 final rule, and the standardized template for reporting credit transactions. In the 2020 final rule, NHTSA also adopted requirements for manufacturers to provide information on terms of credit trades. In this rulemaking, NHTSA is proposing to make changes to its reporting and credit templates and to issue a new template to clarify the required reporting information for credit trades. These new requirements were intended to streamline reporting and data collection from manufacturers, in addition to helping the agency use the best available data to inform CAFE program decision makers.

## 2. How does NHTSA determine compliance?

### (a) Manufacturers Submit Data to NHTSA and EPA and the Agencies Validate Results

EPCA, as amended by EISA, in 49 U.S.C. 32907, requires manufacturers to submit reports to the Secretary of Transportation explaining how they will comply with the CAFE standards for the model year for which the report is made; the actions a manufacturer has taken or intends to take to comply with the standard; and other information the Secretary requires by regulation.<sup>505</sup> A manufacturer must submit a report containing this information during the

30-day period before the beginning of each model year, and during the 30-day period beginning the 180th day of the model year.<sup>506</sup> When a manufacturer determines it is unlikely to comply with a CAFE standard, the manufacturer must report additional actions it intends to take to comply and include a statement about whether those actions are sufficient to ensure compliance.<sup>507</sup>

To implement these reporting requirements, NHTSA issued 49 CFR part 537, “Automotive Fuel Economy Reports,” which specifies three types of CAFE reports that manufacturers must submit.<sup>508</sup> A manufacturer must first submit a pre-model year (PMY) report containing the manufacturer’s projected compliance information for that upcoming model year. By regulation, the PMY report must be submitted in December of the calendar year prior to the corresponding model year.<sup>509</sup> Manufacturers must then submit a mid-model year (MMY) report containing updated information from manufacturers based upon actual and projected information known midway through the model year. By regulation, the MMY report must be submitted by the end of July for the applicable model year.<sup>510</sup> Finally, manufacturers must submit a supplementary report to supplement or correct previously submitted information, as specified in NHTSA’s regulation.<sup>511</sup>

If a manufacturer wishes to request confidential treatment for a CAFE report, it must submit both a confidential and redacted version of the report to NHTSA. CAFE reports submitted to NHTSA contain estimated sales production information, which may be protected as confidential until the termination of the production period for that model year.<sup>512</sup> NHTSA protects each manufacturer’s competitive sales production strategies for 12 months, but does not permanently exclude sales production information from public disclosure. Sales production volumes are part of the information NHTSA routinely makes publicly available through the CAFE PIC.

The manufacturer reports provide information on light-duty automobiles such as projected and actual fuel economy standards, fuel economy performance, and production volumes, as well as information on vehicle design features (*e.g.*, engine displacement and

transmission class) and other vehicle attribute characteristics (*e.g.*, track width, wheelbase, and other off-road features for light trucks). Beginning with MY 2017, to obtain credit for fuel economy improvement values attributable to additional technologies, manufacturers must also provide information regarding A/C systems with improved efficiency, off-cycle technologies (*e.g.*, stop-start systems, high-efficiency lighting, active engine warm-up), and full-size pickup trucks with hybrid technologies or with fuel economy performance that is better than footprint-based targets by specified amounts. This includes identifying the makes and model types equipped with each technology, the compliance category those vehicles belong to, and the associated fuel economy improvement value for each technology.<sup>513</sup> In some cases, NHTSA may require manufacturers to provide supplementary information to justify or explain the benefits of these technologies and their impact on fuel consumption or to evaluate the safety implication of the technologies. These details are necessary to facilitate NHTSA’s technical analyses and to ensure the agency can perform enforcement audits as appropriate.

NHTSA uses manufacturer-submitted PMY, MMY, and supplementary reports to assist in auditing manufacturer compliance data and identifying potential compliance issues as early as possible. Additionally, as part of its footprint validation program, NHTSA conducts vehicle testing throughout the model year to confirm the accuracy of the track width and wheelbase measurements submitted in the reports.<sup>514</sup> These tests help the agency better understand how manufacturers may adjust vehicle characteristics to change a vehicle’s footprint measurement, and ultimately its fuel economy target. NHTSA also includes a summary of manufacturers’ PMY and MMY data in an annual fuel economy performance report made publicly available on its PIC.

As mentioned, NHTSA uses EPA-verified final-model year (FMY) data to evaluate manufacturers’ compliance with CAFE program requirements and draw conclusions about the performance of the industry. After

<sup>513</sup> NHTSA collects model type information based upon the EPA definition for “model type” in 40 CFR 600.002.

manufacturers submit their FMY data, EPA verifies the information, accounting for NHTSA and EPA testing, and subsequently forwards the final verified data to NHTSA.

(b) New CAFE Reporting Templates Adopted in the 2020 Final Rule

NHTSA adopted changes to its CAFE reporting requirements in the 2020 final rule with the intent of streamlining data collection and reporting for manufacturers while helping the agency obtain the best available data to inform CAFE program decision-makers. The agency adopted two new standardized reporting templates for manufacturers. NHTSA's goal was to adopt standardized templates to assist manufacturers in providing the agency with all the necessary data to ensure they comply with CAFE regulations.

The first template was designed for manufacturers to simplify reporting CAFE credit transactions starting in model year 2021. The template's purpose was to reduce the burden on credit account holders, encourage compliance, and facilitate quicker NHTSA credit transaction approval. Before the template, manufacturers would inconsistently submit information required by 49 CFR 536.8, creating difficulties in processing credit transactions. Using the template simplifies CAFE compliance aspects of the credit trading process and helps to ensure that trading parties follow the requirements for a credit transaction in 49 CFR 536.8(a).<sup>515</sup>

The second template was designed to standardize reporting for CAFE PMY and MMY information, as specified in 49 CFR 537.7(b) and (c), as well as supplementary information required by 49 CFR 537.8. The template organizes the required data in a manner consistent with NHTSA and EPA regulations and simplifies the reporting process by incorporating standardized responses consistent with those provided to EPA. The template collects the relevant data, calculates intermediate and final values in accordance with EPA and NHTSA methodologies, and aggregates all the final values required by NHTSA regulations in a single summary worksheet. Thus, NHTSA believes that the standardized templates will benefit both the agency and manufacturers by helping to avoid reporting errors, such as data omissions and miscalculations, and will ultimately simplify and streamline reporting. Manufacturers are required to use the standardized

template for all PMY, MMY, and supplementary CAFE reports starting in MY 2023. The template also allowed manufacturers to enter information to generate the required confidential versions of CAFE reports specified in 49 CFR part 537 and to produce automatically the required non-confidential versions by clicking a button within the template.

The standardized CAFE reporting templates were made available on the NHTSA website and through the DOT docket. Since then, manufacturers have downloaded the templates and met with NHTSA to share recommendations for changes, such as allowing the PMY and MMY reporting templates to accommodate different types of alternative fueled vehicles and to clarify and correct the methods for calculating CAFE values. The proposed changes are discussed in the following sections. NHTSA plans to host a series of workshops to implement the templates and to provide an open dialogue for manufacturers to identify any further problems and seek clarifications. NHTSA plans to announce the workshops through the **Federal Register** later this year.

(1) Changes to the CAFE Reporting Template

The changes to the CAFE Reporting Template include several general improvements made to simply the use and the effectiveness for manufacturers. These include, but are not limited to; wording changes, corrections to calculations and codes, and auto-populating fields previously requiring manual entry.

More specifically, NHTSA is proposing to modify the CAFE Reporting Template by adding filters and sorting functions to help manufacturers connect the data definitions to the location of each of the required data fields in the template. Additional information from other parts of the CAFE Reporting Template would be pulled forward to display on the summary tab. For the information that must be included pursuant to 49 CFR 537.7(b)(2), manufacturers can also compare the values the template calculates to their own internally calculated CAFE values. Additionally, we are proposing to expand the CAFE Reporting Template to include more of the required information regarding vehicle classification, and guidance provided to ease manufacturers reporting burden by having them report only the data used for each vehicle's qualification pathway ignoring other possible light truck classification information.

NHTSA is also proposing that the CAFE Reporting Template be modified to combine the footprint attribute information and model type sub-configuration data for the purposes of matching. NHTSA uses this information to match test data directly to fuel economy footprint values for the purposes of modeling fuel economy standards. Features were added to auto-populate redundant information from one worksheet to another. The data gathered and the formulas coded within the proposed worksheets have also been updated for the calculation of fuel economy based on 40 CFR 600.510–12. The changes to the data and formulas will allow data to more accurately represent the fuel economy of electric and other vehicles using alternative fuels. NHTSA considers this information critically important to forming a more complete picture of the performances of dual fuel and alternative fuel vehicles.

We are also proposing several corrections so that manufacturers will submit CAFE data at each of the different sub-configuration levels they test and will combine CO<sub>2</sub> and fuel economy data. As mentioned, manufacturers test approximately 90-percent of their vehicles within each model type. Each sub-configuration variant within a model type has a unique CO<sub>2</sub> and CAFE value. Manufacturers combine other vehicles at the configuration, base level and then finally at the model type level for determining CAFE performance. The CAFE performance data for the sub-configurations have been added to the proposed template. NHTSA determined that this level of data was needed to verify manufacturers reported CAFE values.

Finally, we are proposing corrections to the CAFE Reporting Template to collect information on off-cycle technologies. The proposed changes match the format of the data with the EPA off-cycle database system. For example, manufacturers report to EPA high efficiency lighting as combination packages, so NHTSA is proposing to change its form to reflect this same level of information.

Version 2.21 of the template is available on NHTSA's Public Information Center (PIC) site.

(2) Credit Transactions Reporting Template

NHTSA established mandatory use of the CAFE credit template starting on January 1, 2021. However, manufacturers identified several calculation errors in the version of the credit reporting template available on

<sup>515</sup> Submitting a properly completed template and accompanying transaction letter will satisfy the trading requirements in 49 CFR part 536.

the PIC site. Those calculation errors have been corrected and a new version of the template is available for download on the NHTSA PIC. Starting January 1, 2022, NHTSA will only accept its credit template as the sole source for executing CAFE credit transactions. Until that time, manufacturers can deviate from the generated language in the NHTSA credit trade confirmation by adding qualifications but, at a minimum, must include the core information generated by the template.

### (3) Monetary and Non-Monetary Credit Trade Information

Credit trading became permissible in MY 2011.<sup>516</sup> To date, NHTSA has received numerous credit trades from entities, but has only made limited information publicly available.<sup>517</sup> As discussed earlier, NHTSA maintains an online CAFE database with manufacturer and fleetwide compliance information that includes year-by-year accounting of credit balances for each credit holder. While NHTSA maintains this database, the agency's regulations currently state that it will not publish information on individual transactions, and NHTSA has not previously required trading entities to submit information regarding the compensation (whether financial, or other items of value) exchanged for credits.<sup>518 519</sup> Thus, NHTSA's PIC offers sparse information to those looking to determine the value of a credit.

The lack of information regarding credit transactions means entities wishing to trade credits have little, if any, information to determine the value of the credits they seek to buy or sell. Historically we have assumed that the civil penalty for noncompliance with CAFE standards largely determines the upper value of a credit, because it is logical to assume that manufacturers would not purchase credits if it cost less to pay civil penalties instead, but it is unknown how other factors affect the value. For example, a credit nearing the end of its five-model-year lifespan would theoretically be worth less than a credit within its full five-model-year lifespan. In the latter case, the credit holder would likely value the credit

more, as it can be used for compliance purposes for a longer period of time.

NHTSA adopted requirements in the 2020 final rule requiring manufacturers to submit all credit trade contracts, including cost and transactional information, to the agency starting January 1, 2021. NHTSA also adopted requirements allowing manufacturers to submit the information confidentially, in accordance with 49 CFR part 512.<sup>520</sup> As stated in the final rule, NHTSA intended to use this information to determine the true cost of compliance for all manufacturers. This information would allow NHTSA to better assess the impact of its regulations on the industry and provide more insightful information in developing future rulemakings. This confidential information would be held by secure electronic means in NHTSA's database systems. As for public information, NHTSA would include more information on the PIC on aggregated credit transactions, such as the combined flexibilities all manufacturers used for compliance as shown in Figure VII-6, or information comparable to the credit information EPA makes available to the public. In the future, NHTSA will consider what information, if any, can be meaningfully shared with the public on credit transactional details or costs, while accounting for the concerns raised by the automotive industry for protecting manufacturers' competitive sources of information.

However, manufacturers continue to argue that disclosing trading terms may not be as simple as a spot purchase at a given price. As stated in the 2020 final rule, manufacturers contend a number of transactions for both CAFE and CO<sub>2</sub> credits involve a range of complexity due to numerous factors that are reflective of the marketplace, such as the volume of credits, compliance category, credit expiration date, a seller's compliance strategy, and even the CAFE penalty rate in effect at that time. In addition, automakers have a range of partnerships and cooperative agreements with their own competitors. Credit transactions can be an offshoot of these broader relationships, and difficult to price separately and independently.

Since then, NHTSA has identified a series of non-monetary factors that it believes to be important to the costs associated with credit trading in the CAFE program.<sup>521</sup> The agency believes this information will allow for a better

assessment of the true costs of compliance. NHTSA further notes that greater government oversight is needed over the CAFE credit market and it needs to understand the full range of complexity in transactions, monetary and non-monetary, in addition to the range of partnerships and cooperative agreements between credit account holders—which may impact the price of credit trades.<sup>522</sup> Therefore, using the identified series of non-monetary factors, NHTSA has developed a new CAFE Credit Reporting Template (Form 1621) for capturing the monetary and non-monetary terms of credit trading contracts. NHTSA proposes that manufacturers start using the new template starting September 1, 2022. The draft template can be viewed and downloaded from the NHTSA PIC site.

### 3. What compliance flexibilities and incentives are currently available under the CAFE program and how do manufacturers use them?

Generating, trading, transferring, and applying CAFE credits is governed by statute.<sup>523</sup> Program credits are generated when a vehicle manufacturer's fleet over-complies with its standard for a given model year, meaning its vehicle fleet achieved a higher corporate average fuel economy value than the amount required by the CAFE program for that fleet in that model year. Conversely, if the fleet average CAFE level does not meet the standard, the fleet incurs debits (also referred to as a shortfall or deficit). A manufacturer whose fleet generates a credit shortfall in a given model year can resolve its shortfall using any one or combination of several credits flexibilities, including credit carryback, credit carry-forward, credit transfers, and credit trades, and if all credit flexibilities have been exhausted, then the manufacturer must resolve its shortfall by making civil penalty payments.<sup>524</sup>

NHTSA has also promulgated compliance flexibilities and incentives consistent with EPCA's provisions regarding calculation of fuel economy levels for individual vehicles and for fleets.<sup>525</sup> These compliance flexibilities and incentives, which were first adopted in the 2012 rule for MYs 2017 and later, include A/C efficiency improvement and off-cycle adjustments,

<sup>516</sup> 49 CFR 536.6(c).

<sup>517</sup> Manufacturers may generate credits, but non-manufacturers may also hold or trade credits. Thus, the word "entities" is used to refer to those that may be a party to a credit transaction.

<sup>518</sup> 49 CFR 536.5(e)(1).

<sup>519</sup> NHTSA understands that not all credits are exchanged for monetary compensation. The proposal that NHTSA is adopting in this proposed rule requires entities to report compensation exchanged for credits and is not limited to reporting monetary compensation.

<sup>520</sup> See also 49 U.S.C. 32910(c).

<sup>521</sup> UCS, Detailed Comments, NHTSA-2018-0067-12039; Jason Schwartz, Detailed Comments, NHTSA-2018-0067-12162.

<sup>522</sup> Honda, Detailed Comments, NHTSA-2018-0067-11819.

<sup>523</sup> 49 U.S.C. 32903.

<sup>524</sup> Manufacturers may elect to pay civil penalties rather than utilizing credit flexibilities at their discretion. For purposes of the analysis, we assume that manufacturers will only pay penalties when all flexibilities have been exhausted.

<sup>525</sup> 49 U.S.C. 32904.

and adjustments for advanced technologies in full-size pickup trucks, including adjustments for mild and strong hybrid electric full-size pickup trucks and performance-based incentives in full-size pickup trucks. The fuel consumption improvement benefits of these technologies measured by various testing methods can be used by manufacturers to increase the CAFE performance of their fleets.

#### (a) Available Credit Flexibilities

Under NHTSA regulations, credit holders (including, but not limited to manufacturers) have credit accounts with NHTSA where they can, hold credits, and use them to achieve compliance with CAFE standards, by carrying forward, carrying back, or transferring credits across compliance categories, subject to several restrictions. Manufacturers with excess credits in their accounts can also trade credits to other manufacturers, who may use those credits to resolve a shortfall currently or in a future model year. A credit may also be cancelled before its expiration date if the credit holder so chooses. Traded and transferred credits are subject to an “adjustment factor” to ensure total oil savings are preserved.<sup>526</sup>

Credit “carryback” means that manufacturers are able to use recently earned credits to offset a deficit that had accrued in a prior model year, while credit “carry-forward” means that manufacturers can bank credits and use them towards compliance in future model years. EPCA, as amended by EISA, allows manufacturers to carryback credits for up to three model years, and to carry-forward credits for up to five model years.<sup>527</sup> Credits expire the model year after which the credits may no longer be used to achieve compliance with fuel economy regulations.<sup>528</sup> Manufacturers seeking to use carryback credits must submit a carryback plan to NHTSA, for NHTSA’s review and approval, demonstrating their ability to earn sufficient credits in future MYs that can be carried back to resolve the current MY’s credit shortfall.

Credit “trading” refers to the ability of manufacturers or persons to sell credits to, or purchase credits from, one another while credit “transfer” means the ability to transfer credit between a manufacturer’s compliance fleets to resolve a credit shortfall. EISA gave NHTSA discretion to establish by regulation a CAFE credit trading program, to allow credits to be traded between vehicle manufacturers, now

codified at 49 CFR part 536.<sup>529</sup> EISA prohibits manufacturers from using traded credits to meet the minimum domestic passenger car CAFE standard.<sup>530</sup>

#### (b) Fuel Savings Adjustment Factor

Under NHTSA’s credit trading regulations, a fuel savings adjustment factor is applied when trading occurs between manufacturers and those credits are used, or when a manufacturer transfers credits between its compliance fleets and those credits are used, but not when a manufacturer carries credits forward or backwards within the same fleet.<sup>531</sup>

NHTSA is including in this proposal a restoration of certain definitions that are part of the adjustment factor equation that had been inadvertently deleted in the 2020 final rule. The 2020 final rule had intended to add a sentence to the adjustment factor term in 49 CFR 536.4(c), simply to make clear that the figure should be rounded to four decimal places. While the 2020 final rule implemented this change, the amendatory instruction for doing so unintentionally deleted several other definitions from that paragraph. NHTSA had not intended to modify or delete those definitions, so they are simply being added back into the paragraph.

#### (c) VMT Estimates for Fuel Savings Adjustment Factor

NHTSA uses VMT estimates as part of its fuel savings adjustment equation. Including VMT is important as fuel consumption is directly related to vehicle use, and in order to ensure trading credits between fleets preserves oil savings, VMT must be considered.<sup>532</sup> For MYs 2017 and later, NHTSA finalized VMT values of 195,264 miles for passenger car credits, and 225,865 miles for light truck credits.<sup>533</sup>

#### (d) Fuel Economy Calculations for Dual and Alternative Fueled Vehicles

As discussed at length in prior rulemakings, EPCA, as amended by EISA, encouraged manufacturers to build alternative-fueled and dual- (or flexible-) fueled vehicles by providing special fuel economy calculations for “dedicated” (that is, 100 percent) alternative fueled vehicles and “dual-fueled” (that is, capable of running on either the alternative fuel or gasoline/diesel) vehicles.

Dedicated alternative-fuel automobiles include electric, fuel cell, and compressed natural gas vehicles, among others. The statutory provisions for dedicated alternative fuel vehicles in 49 U.S.C. 32905(a) state that the fuel economy of any dedicated automobile manufactured after MY 1992 shall be measured “based on the fuel content of the alternative fuel used to operate the automobile. A gallon of liquid alternative fuel used to operate a dedicated automobile is deemed to contain 0.15 gallon of fuel.” There are no limits or phase-out for this special fuel economy calculation within the statute.

EPCA’s statutory incentive for dual-fueled vehicles at 49 U.S.C. 32906 and the measurement methodology for dual-fueled vehicles at 49 U.S.C. 32905(b) and (d) expired after MY 2019. In the 2012 final rule, NHTSA and EPA concluded that it would be inappropriate and contrary to the intent of EPCA/EISA to measure dual-fueled vehicles’ fuel economy like that of conventional gasoline vehicles with no recognition of their alternative fuel capability. The agencies determined that for MY 2020 and later vehicles, the general statutory provisions authorizing EPA to establish testing and calculation procedures provide discretion to set the CAFE calculation procedures for those vehicles. The methodology for EPA’s approach is outlined in the 2012 final rule for MYs 2017 and later at 77 FR 63128 (Oct. 15, 2012).

#### (e) Flexibilities for Air-Conditioning Efficiency, Off-Cycle Technologies, and Full-Size Pickup Trucks

##### (1) Incentives for Advanced Technologies in Full-Size Pickup Trucks

Under its EPCA authority for CAFE and under its CAA authority for GHGs, EPA established fuel consumption improvement values (FCIVs) for manufacturers that hybridize a significant quantity of their full-size pickup trucks, or that use other technologies that significantly reduce fuel consumption of these full-sized pickup trucks. More specifically, CAFE FCIVs were made available to manufacturers that produce full-size pickup trucks with Mild HEV or Strong HEV technology, provided the percentage of production with the technology is greater than specified percentages.<sup>534</sup> In addition, CAFE FCIVs were made available for manufacturers that produce full-size pickups with other technologies that enable full-size

<sup>529</sup> 49 U.S.C. 32903(f).

<sup>530</sup> 49 U.S.C. 32903(f)(2).

<sup>531</sup> See Section III.C for details about carry forward and back credits.

<sup>532</sup> See 49 CFR 536.4(c).

<sup>533</sup> 77 FR 63130 (Oct. 15, 2012).

<sup>534</sup> 77 FR 62651 (Oct. 15, 2012).

<sup>526</sup> See Section VII.B.3.b) for details.

<sup>527</sup> 49 U.S.C. 32903(a).

<sup>528</sup> 49 CFR 536.3(b).

pickup trucks to exceed their CAFE targets based on footprints by specified amounts (*i.e.*, electric vehicles and other electric components).<sup>535</sup> These performance-based incentives create a technology-neutral path (as opposed to the other technology-encouraging path) to achieve the CAFE FCIVs, which would encourage the development and application of new technological approaches.

Large pickup trucks represent a significant portion of the overall light duty vehicle fleet and generally have higher levels of fuel consumption and GHG emissions than most other light duty vehicles. Improvements in the fuel economy and GHG emissions of these vehicles can have significant impact on the overall light-duty fleet fuel use and GHG emissions. NHTSA believes that offering incentives could encourage the deployment of technologies that can significantly improve the efficiency of these vehicles and that also will foster production of those technologies at levels that will help achieve economies of scale, would promote greater fuel savings overall and make these technologies more cost effective and available in the future model years to assist in compliance with CAFE standards.

EPA and NHTSA also established limits on the eligibility for these pickup trucks to qualify for incentives. A truck was required to meet minimum criteria for bed size and towing or payload capacities and meet minimum production thresholds (in terms of a percentage of a manufacturer's full-size pickup truck fleet) in order to qualify for these incentives. Under the provisions, Mild HEVs are eligible for a per-vehicle CO<sub>2</sub> credit of 10 g/mi (equivalent to 0.0011 gallon/mile for a gasoline-fueled truck) during MYs 2017–2021. To be eligible a manufacturer would have to show that the Mild HEV technology is utilized in a specified portion of its truck fleet beginning with at least 20 percent of a company's full-size pickup production in MY 2017 and ramping up to at least 80 percent in MY 2021. Strong HEV pickup trucks are eligible for a 20 g/mi credit (0.0023 gallon/mile) during MYs 2017–2021, and in this rulemaking proposed to be extended through MY 2026, if the technology is used on at least 10 percent of a company's full-size pickups in that model year. EPA and NHTSA also adopted specific definitions for Mild and Strong HEV pickup trucks, based on energy flow to the high-voltage battery during testing.

Furthermore, to incentivize other technologies that can provide significant reductions in GHG emissions and fuel consumption for full-size pickup trucks, EPA also adopted, a performance-based fuel consumption improvement value for full-size pickup trucks. Eligible pickup trucks certified as performing 15 percent better than their applicable CO<sub>2</sub> target receive a 10 g/mi credit (0.0011 gallon/mile), and those certified as performing 20 percent better than their target receive a 20 g/mi credit (0.0023 gallon/mile). The 10 g/mi performance-based credit is available for MYs 2017 to 2021 and, once qualifying; a vehicle model will continue to receive the credit through MY 2021, provided its CO<sub>2</sub> emissions level does not increase. To be eligible a manufacturer would have to show that the technology is utilized in a specified portion of its truck fleet beginning with at least 20 percent of a company's full-size pickup production in MY 2017 and ramping up to at least 80 percent in MY 2021. The 20 g/mi performance-based credit was available for a vehicle model for a maximum of 5 years within the 2017 to 2021 model year period, and in this rulemaking proposed to be extended through MY 2026, provided its CO<sub>2</sub> emissions level does not increase. To be eligible, the technology must be applied to at least 10 percent of a company's full-size pickups in for the model year.

The agencies designed a definition for full-size pickup truck based on minimum bed size and hauling capability, as detailed in 40 CFR 86.1866–12(e). This definition ensured that the larger pickup trucks, which provide significant utility with respect to bed access and payload and towing capacities, are captured by the definition, while smaller pickup trucks with more limited capacities are not covered. A full-size pickup truck is defined as meeting requirements (1) and (2) below, as well as either requirement (3) or (4) below.

(1) Bed Width—The vehicle must have an open cargo box with a minimum width between the wheelhouses of 48 inches. And—

(2) Bed Length—The length of the open cargo box must be at least 60 inches. And—

(3) Towing Capability—the gross combined weight rating (GCWR) minus the gross vehicle weight rating (GVWR) must be at least 5,000 pounds. Or—

(4) Payload Capability—the GVWR minus the curb weight (as defined in 40 CFR 86.1803) must be at least 1,700 pounds.

In the 2020 CAFE rule, the agencies ended the incentives for full-size pickup trucks after the end of model year 2021

believing expanded incentives would likely not result in any further emissions benefits or fuel economy improvements since an increase in sales volume was unanticipated. At the time, no manufacturer had qualified to use the full-size pickup truck incentives since they went into effect in MY 2017. One vehicle manufacturer introduced a mild hybrid pickup truck in MY 2019 but was ineligible for the FCIV because it did not meet the minimum production threshold. Other manufacturers had announced potential collaborations or started designing future hybrid or electric models, but none were expected to meet production requirements within the time period of eligibility for these incentives.

Since the 2020 final rule, many manufacturers have publicly announced several new model types of full-size electric pickup trucks starting in MY 2022. NHTSA notes that historically its goal has always been to promote electric vehicles due to their exceptional fuel saving benefits. For this reason, even given the discontinuation in MY 2019 of AMFA incentives for dual fueled vehicles, NHTSA retained its benefits for alternative dedicated fueled vehicles to focus on the growth of electric vehicles in the market. Therefore, after the careful consideration of this new information and the potential role incentives could play in increasing the production of these technologies, and the associated beneficial impacts on fuel consumption, the agency is proposing to extend the full-size pickup truck incentive through MY 2025 for strong hybrids and for full-size pickup trucks performing 20-percent better than their target. Also, understanding the importance of electric vehicles in the market, NHTSA is proposing to allow manufacturers to combine both the incentives for alternative fueled vehicles and full-size pickup trucks FCIVs when complying with the CAFE program.

#### (2) Flexibilities for Air Conditioning Efficiency

A/C systems are virtually standard automotive accessories, and more than 95 percent of new cars and light trucks sold in the U.S. are equipped with mobile A/C systems. A/C system usage places a load on an engine, which results in additional fuel consumption; the high penetration rate of A/C systems throughout the light-duty vehicle fleet means that more efficient systems can significantly impact the total energy consumed. A/C systems also have non-CO<sub>2</sub> emissions associated with

<sup>535</sup> *Id.*

refrigerant leakage.<sup>536</sup> Manufacturers can improve the efficiency of A/C systems though redesigned and refined A/C system components and controls.<sup>537</sup> That said, such improvements are not measurable or recognized using 2-cycle test procedures since A/C is turned off during 2-cycle testing. Any A/C system efficiency improvements that reduce load on the engine and improve fuel economy is therefore not measurable on those tests.

The CAFE program includes flexibilities to account for the real-world fuel economy improvements associated with improved A/C systems and to include the improvements for compliance.<sup>538</sup> The total A/C efficiency credits is calculated by summing the individual credit values for each efficiency improving technology used on a vehicle, as specified in the A/C credit menu. The total A/C efficiency credit sum for each vehicle is capped at 5.0 grams/mile for cars and 7.2 grams/mile for trucks. Additionally, the off-cycle credit program contains credit earning opportunities for technologies that reduce the thermal loads on a vehicle from environmental conditions (solar loads or parked interior air temperature).<sup>539</sup> These technologies are listed on a thermal control menu that provides a predefined improvement value for each technology. If a vehicle has more than one thermal load improvement technology, the improvement values are added together, but subject to a cap of 3.0 grams/mile for cars and 4.3 grams/mile for trucks. Under its EPCA authority for CAFE, EPA calculates equivalent FCIVs and applies them for the calculation of manufacturer's fleet CAFE values. Manufacturers seeking credits beyond the regulated caps must request the added benefit for A/C technology under the off-cycle program discussed in the

<sup>536</sup> Notably, manufacturers cannot claim CAFE-related benefits for reducing A/C leakage or switching to an A/C refrigerant with a lower global warming potential. While these improvements reduce GHG emissions consistent with the purpose of the CAA, they generally do not impact fuel economy and, thus, are not relevant to the CAFE program.

<sup>537</sup> The approach for recognizing potential A/C efficiency gains is to utilize, in most cases, existing vehicle technology/componentry, but with improved energy efficiency of the technology designs and operation. For example, most of the additional A/C-related load on an engine is because of the compressor, which pumps the refrigerant around the system loop. The less the compressor operates, the less load the compressor places on the engine resulting in less fuel consumption. Thus, optimizing compressor operation with cabin demand using more sophisticated sensors, controls, and control strategies is one path to improving the efficiency of the A/C system.

<sup>538</sup> See 40 CFR 86.1868–12.

<sup>539</sup> See 40 CFR 86.1869–12(b).

next section. The agency is not proposing to change its A/C efficiency flexibility and will retain its provisions in its current form.

### (3) Flexibilities for Off-Cycle Technologies

“Off-cycle” technologies are those that reduce vehicle fuel consumption in the real world, but for which the fuel consumption reduction benefits cannot be fully measured under the 2-cycle test procedures (city, highway or correspondingly FTP, HFET) used to determine compliance with the fleet average standards. The cycles are effective in measuring improvements in most fuel economy improving technologies; however, they are unable to measure or underrepresent certain fuel economy improving technologies because of limitations in the test cycles. For example, off-cycle technologies that improve emissions and fuel economy at idle (such as “stop start” systems) and those technologies that improve fuel economy to the greatest extent at highway speeds (such as active grille shutters which improve aerodynamics) receive less than their real-world benefits in the 2-cycle compliance tests.

In the CAFE rule for MYs 2017–2025, EPA, in coordination with NHTSA, established regulations extending the off-cycle technology flexibility to the CAFE program starting with MY 2017. For the CAFE program, EPA calculates off-cycle fuel consumption improvement values (FCIVs) that are equivalent to the EPA CO<sub>2</sub> credit values, and applies them in the calculation of manufacturer's CAFE compliance values for each fleet instead of treating them as separate credits as for the EPA GHG program.

For determining benefits, EPA created three compliance pathways for the off-cycle program. The first approach allows manufacturers to gain credits using a predetermined approach or “menu” of credit values for specific off-cycle technologies which became effective starting in MY 2014 for EPA.<sup>540 541</sup> This pathway allows manufacturers to use credit values established by EPA for a wide range of off-cycle technologies, with minimal or no data submittal or testing requirements.<sup>542</sup> Specifically, EPA

<sup>540</sup> See 40 CFR 86.1869–12(b). The first approach requires some technologies to derive their predetermined credit values through EPA's established testing. For example, waste heat recovery technologies require manufacturers to use 5-cycle testing to determine the electrical load reduction of the waste heat recovery system.

<sup>541</sup> EPA implemented its off-cycle GHG program starting in MY 2012.

<sup>542</sup> The Technical Support Document (TSD) for the 2012 final rule for MYs 2017 and beyond

established a menu with a number of technologies that have real-world fuel consumption benefits not measured, or not fully measured, by the two-cycle test procedures, and those benefits were reasonably quantified by the agencies at that time. For each of the pre-approved technologies on the menu, EPA established a menu value or approach that is available without testing verifications. Manufacturers must demonstrate that they are in fact using the menu technology, but not required to submit test results to EPA to quantify the technology's effects, unless they wish to receive a credit larger than the default value. The default values for these off-cycle credits were largely determined from research, analysis, and simulations, rather than from full vehicle testing, which would have been both cost and time prohibitive. EPA generally used conservative predefined estimates to avoid any potential credit windfall.<sup>543</sup>

For off-cycle technologies not on the pre-defined technology list, EPA created a second pathway which allows manufacturers to use 5-cycle testing to demonstrate off-cycle improvements.<sup>544</sup> Starting in MY 2008, EPA developed the “five-cycle” test methodology to measure fuel economy for the purpose of improving new car window stickers (labels) and giving consumers better information about the fuel economy they could expect under real-world driving conditions.<sup>545</sup> As learned through development of the “five-cycle” methodology and prior rulemakings, there are technologies that provide real-world fuel consumption improvements,

provides technology examples and guidance with respect to the potential pathways to achieve the desired physical impact of a specific off-cycle technology from the menu and provides the foundation for the analysis justifying the credits provided by the menu. The expectation is that manufacturers will use the information in the TSD to design and implement off-cycle technologies that meet or exceed those expectations in order to achieve the real-world benefits of off-cycle technologies from the menu.

<sup>543</sup> While many of the assumptions made for the analysis were conservative, others were “central.” For example, in some cases, an average vehicle was selected on which the analysis was conducted. In that case, a smaller vehicle may presumably deserve fewer credits whereas a larger vehicle may deserve more. Where the estimates are central, it would be inappropriate for the agencies to grant greater credit for larger vehicles, since this value is already balanced by smaller vehicles in the fleet. The agencies take these matters into consideration when applications are submitted for credits beyond those provided on the menu.

<sup>544</sup> See 40 CFR 86.1869–12(c). EPA proposed a correction for the 5-cycle pathway in a separate technical amendments rulemaking. See 83 FR 49344 (Oct. 1, 2019). EPA is not approving credits based on the 5-cycle pathway pending the finalization of the technical amendments rule.

<sup>545</sup> <https://www.epa.gov/vehicle-and-fuel-emissions-testing/dynamometer-drive-schedules>.

but those improvements are not fully reflected on the “two-cycle” test. EPA established this alternative for a manufacturer to demonstrate the benefits of off-cycle technologies using 5-cycle testing. The additional emissions test allows emission benefits to be demonstrated over some elements of real-world driving not captured by the two-cycle CO<sub>2</sub> compliance tests including high speeds, rapid accelerations, hot temperatures, and cold temperatures. Under this pathway, manufacturers submit test data to EPA, and EPA determines whether there is sufficient technical basis to approve the off-cycle credits. No public comment period is required for manufacturers seeking credits using the EPA menu or using 5-cycle testing.

The third pathway allows manufacturers to seek EPA review, through a notice and comment process, to use an alternative methodology other than the menu or 5-cycle methodology for determining the off-cycle technology CO<sub>2</sub> credits.<sup>546</sup> Manufacturers must provide supporting data on a case-by-case basis demonstrating the benefits of the off-cycle technology on their vehicle models. Manufacturers may also use the third pathway to apply for credits and FCIVs for menu technologies where the manufacturer is able to demonstrate credits and FCIVs greater than those provided by the menu.

#### (a) The Off-Cycle Process

In meetings with EPA and manufacturers, NHTSA examined the processes for bringing off-cycle technologies into market. Two distinct processes were identified: (1) The manufacturer’s off-cycle pre-production process, and; (2) the manufacturer’s regulatory compliance process. During the pre-production process, the off-cycle program for most manufacturers begins as early as four to 6 years in advance of the given model year. Manufacturers’ design teams or suppliers identify technologies to develop capable of qualifying for off-cycle credits after careful considering of the possible benefits. Manufacturer then identify the opportunities for the technologies finding the most optimal condition for equipping the technology given the availability in the production cycle of either new or multiple platforms capitalizing on any commonalities to increase sales volumes and reduce costs. After establishing their new or series platform development plans, manufacturers have two processes for off-cycle technologies on the pre-defined menu list or using 5-cycle

testing and for those for which benefits are sought using the alternative approval methodology. For those on the menu list or 5-cycle testing, technologies whose credit amounts are defined by EPA regulation, manufacturers confirm that: (1) New candidate technologies meet regulatory definitions; and (2) for qualifying technologies, there is real fuel economy (FE) benefit based on good engineering judgement and/or testing. For these technologies, manufacturers conduct research and testing independently without communicating with EPA or NHTSA. For non-menu technologies, those not defined by regulation, manufacturers pre-production processes include: (1) Determining the credit amounts based on the effectiveness of the technologies; (2) developing suitable test procedures; (3) identifying any necessary studies to support effectiveness; (4) and identifying the necessary equipment or vehicle testing using good engineer judgement to confirm the vehicle platform benefits of the technology.

While for the regulatory compliance process, the first step for manufacturers begins by providing EPA with early notification in their pre-model year GHG reports (*e.g.*, 2025MY Pre-GHG are due in 2023CY) of their intention to generate any off-cycle credits in accordance with 40 CFR 600.514–12. Next, manufacturers present a brief overview of the technology concept and planned model types for their off-cycle technologies as a part of annual pre-certification meetings with EPA. Manufacturers typically hold their pre-certification meetings with EPA somewhere between September through November two years in advance of each model year. These meetings are designed to give EPA a holistic overview of manufacturers planned product offerings for the upcoming compliance model year and since 2012 information on the A/C and off-cycle programs. Thus, a manufacturer complying in the 2023 compliance model year would arrange its pre-certification meeting with EPA in September 2021 and would be required to share information on the A/C and off-cycle technologies its plans to equip during the model year. After this, manufacturers report projected information on off-cycle technologies as a part of their CAFE reports to NHTSA in accordance with 49 CFR part 537 CAFE due by December 31st before the end of the model year.

According to EPA and NHTSA regulations, eligibility to gain benefits for off-cycle technologies only require manufacturers to reporting information

in advance of the model year notifying the agencies of a manufacturer’s intent to claim credits. More specifically, manufacturers must notify EPA in their pre-model year reports, and in their applications for certification, of their intention to generate any A/C and off-cycle credits before the model year, regardless of the methodology for generating credits. Similarly, for NHTSA, manufacturers are also required to provide data in their pre-model year reports required by 49 CFR part 537 including projected information on A/C, off-cycle, and full-size pickup truck incentives. These regulations require manufacturers to report information on factors such as the approach for determining the benefit of the technology, projected production information and the planned model types for equipping the off-cycle technology.

If a manufacturer is pursuing credits for a non-menu off-cycle technology, EPA also encourages manufacturers to seek early reviews for the eligibility of a technology, the test procedure, and the model types for testing in advance of the model year. EPA emphasizes the critical importance for manufacturers to seek these reviews prior to conducting testing or any analytical work. Yet, some manufacturers have decided not to seek EPA’s early reviews which resulted in significant delays in the process as EPA has had to identify and correct multiple testing and analytical errors after the fact. Consequently, EPA’s goal is to provide approvals for manufacturers as early as possible to ensure timely processing of their credit requests. NHTSA shares the same goals and views as EPA for manufacturers submissions but to-date neither agency has created any required deadlines for these reviews. For NHTSA, its only requirement is for manufacturers to submit copies of all information sent to EPA at the same time.

The next step in the credit review process is for manufacturers to submit an analytical plan defining the required testing to derive the exact benefit of a non-menu off-cycle technology before the model year begins and then to start testing. It is noted that some manufacturers failed to seek EPA’s early reviews which delayed finalizing their analytical plans and then the start of their testing. These delays had greater impacts depending upon the required testing for the technology. For example, some manufacturers were required to conduct a four-season testing methodology lasting almost a year to evaluate the performance of a technology during all environmental conditions.

<sup>546</sup> See 40 CFR 86.1869–12(d).

After completing testing, manufacturers are required to prepare an official application requesting a certain amount of off-cycle credits for the technology. In accordance with EPA regulations, the official application request must include final testing data, details on the methodology used to determine the off-cycle credit value, and the official benefit value requested. EPA anticipated that these submissions would be made prior to the end of the model year where the off-cycle technology was applied.

Each manufacturers' application to EPA must then undergo a public notice and comment process if the manufacturer uses a methodology to derive the benefit of a technology not previously approved by EPA. Once a methodology for a specific off-cycle technology has gone through the public notice and comment process and is approved for one manufacturer, other manufacturers may follow the same methodology to collect data on which to base their off-cycle credits. Other manufacturers are only required to submit applications citing the approved methodology, but those manufacturers must provide their own necessary test data, modeling, and calculations of credit value specific to their vehicles, and any other vehicle-specific details pursuant to that methodology, to assess an appropriate credit value. This is similar to what occurred with the advanced A/C compressor, where one manufacturer applied for credits with data collected through bench testing and vehicle testing, and subsequent to the first manufacturer being approved, other manufacturers applied for credits following the same methodology by submitting test data specific for their vehicle models. Consequently, as long as the testing is conducted using the previously-approved methodology, EPA will evaluate the credit application and issue a decision with no additional notice and comment, since the first application that established the methodology was subject to notice and comment. EPA issues a decision document regarding the manufacturer's official application upon resolution of any public comments to the its **Federal Register** notice and after consultation with NHTSA. Finally, manufacturers submit information after the model year ends on off-cycle technologies and the equipped vehicles in their final CAFE reports due by March 30th and then in their final GHG Averaging, Banking, and Trading (AB&T) reports due to EPA by April 30th.

During the 2020 rulemaking, the agencies and manufacturers both agreed that responding to petitions before the

end of a model year is beneficial to manufacturers and the government. It allows manufacturers to have a better idea of what credits they will earn, and for the government, a timely and less burdensome completion of manufacturers' end-of-the-year final compliance processes. EPA structured the A/C and off-cycle programs to make it possible to complete the processes by the end of the model year so manufacturers could submit their final reports within the required deadline—90 days after the calendar year, when CAFE final reports are due from manufacturers.<sup>547</sup>

However, at the time of the previous rulemaking, manufacturers were submitting retroactive off-cycle petitions for review causing significant delays to review and approval of novel technologies and issuances of **Federal Register** notices seeking public comments, where applicable. As a result, the agencies set a one-time allowance that ended in May 2020 for manufacturers to ask for retroactive credits or FCIVs for off-cycle technologies equipped on previously-manufactured vehicles after the model year had ended. After that time, the agencies denied manufacturers' late submissions requesting retroactive credits. However, manufacturers who properly submitted information ahead of time were allowed to make corrections to resolve inadvertent errors during or after the model year.

Both EPA and NHTSA regulations fail to include specific deadlines for manufacturers to meet in finalizing their off-cycle analytical plans or the official applications to the agencies. The agencies believed that enforcing the existing submission requirements would be the most efficient approach to expedite approvals and set aside adding any new regulatory deadlines or additional requirements in the previous rulemaking. There were also concerns to provide manufacturers with maximum flexibility and due to the uncertainties existing with the non-menu off-cycle process. However, the agencies anticipated that any timeliness problems would resolve themselves as the off-cycle program reached maturity and more manufacturers began requesting benefits for previously approved off-cycle technologies.

Despite the agencies' expectations, the lack of deadlines for test results or the official application has significantly delayed approvals for non-menu off-cycle requests. In many cases, EPA has received off-cycle non-menu application requests either late in the model year or

after the model year. This falls outside the agencies planned strategy for the off-cycle non-menu review process whereas manufacturers would seek approval and submit their official application requests either in advance of the model year or early enough in the model year to allow the agency to approve a manufacturer's credits before the end of the model year.

#### (b) Proposed Changes to the Off-Cycle Program

##### (i) Review Process

The current review process for off-cycle technologies is causing significant challenges in finalizing end-of-the-year compliance processes for the agencies. The backlog of retro-active and pending late off-cycle requests have delayed EPA from recalculating NHTSA's MY 2017 finals and from completing those for MYs 2018 and 2019. Fifty-four off-cycle non-menu requests have been submitted to EPA to date. Nineteen of the requests were submitted late and another seven apply retroactively to previous model years starting as early as model year 2015. Since these requests represent potential credits or adjustments that will influence compliance figures, CAFE final results cannot be finalized until all off-cycle requests have been disposed. These factors have so far delayed MY 2017 final CAFE compliance by 28 months, MY 2018 by 15 months, and MY 2019 by 4 months.

These late reports amount to more than just a mere accounting nuisance for the agencies; they are actively chilling the credit market. Until EPA verifies final compliance numbers, manufacturers are uncertain about either how many credits they have available to trade or, conversely, how many credits are necessary for them to cover any shortfalls.

For MY 2017, NHTSA will void manufacturers' previous credit trades pending the revised final calculations. Second, until late requests are approved, credit sellers are unable to make trades with buyers having pending approvals or credits are sold whereas the final balance of credits is unknown. Because credit trades and transfers must be adjusted for fuel savings anytime a change occurs in a manufacturer's CAFE values, the resulting earned or purchased credits must be recalculated. These recalculations are significantly burdensome on the government to administer and places an undue risk on manufacturers involved in CAFE credit trade transactions.

NHTSA met with EPA and manufacturers to better understand the process for reviewing off-cycle non-menu technologies. From these

<sup>547</sup> 40 CFR 600.512(12).

discussions, NHTSA identified several issues that may be influencing late submissions. First, non-menu requests are becoming more complex and are requiring unique reviews. Previously approved technologies are also becoming more complex and are requiring either new testing, test procedures or have evolved beyond the definitions which at one time previously qualified them. Next, manufacturers identified the lack of standardized test procedures approved by EPA or certainty from EPA on which model types need to be tested as major sources for delays in submitting their analytical plans. In addition, manufacturers claimed there is significant uncertainty surrounding the necessary data sources to substantiate the benefit of the technology. For example, the data sources necessary to substantiate the usage rates certain technologies in the market. Testing or extrapolating test results for variations in model types can also be difficult and a source of delay. Manufacturers are typically uncertain as to what configurations within a model type must be tested and believe further guidance may be needed by EPA. Manufacturers further claim that it is challenging to coordinate the required testing identified by EPA for off-cycle in coordination with other required certification and emissions testing. Several of these issues were addressed in the 2020 final rule. In that rulemaking, the agencies stated that developing a standardized test procedure “toolbox” may not be possible due to the development of new and emerging technologies, and manufacturers’ different approaches for evaluating the benefits of the technologies. However, the agencies committed to considering additional guidance, if feasible, as the programs further matures in the review process of technologies and, if possible, identify consistent methodologies that may help manufacturers analyze off-cycle technologies.

Part of the issue is that the review process begins significantly later than the development of technology. Typically, EPA only learns about a new off-cycle technology during manufacturers’ precertification meetings, months or even years after manufacturers started to develop the technology. NHTSA seeks comments on whether opportunities exist during the initial development of off-cycle technologies for manufacturers to start discussions with the agencies to identify suitable test procedures or approval of the initial concept of a new technology.

After certification meetings, NHTSA also identified that in many cases, manufacturers do not communicate with EPA seeking approvals for their test procedures, test vehicles or credit calculations until anywhere from 3–6 months after the initial development of the technology. Delays in approving a suitable test procedure extends the manufacturers ability to perform testing or to submit its formal request for benefits until after the model year has ended. As mentioned, testing can take up to 12 months after a suitable test procedure and identifying which subconfigurations must be tested.

One manufacturer also stated that set submission deadlines are impossible, agency approvals are variable based on OEM need and reply timing is driven by the EPA. When questioned whether any deadlines could be imposed manufacturers responded believing any deadlines would need to be negotiated between the manufacturer and the government. Please comment on any drawbacks associated with negotiating and enforcing off-cycle process deadlines with manufacturers.

NHTSA is proposing to modify the eligibility requirements for non-menu off-cycle technologies in the CAFE program starting in model year 2024. Manufacturers will be required to finalize their analytical plans by December before the model years and their final official technology credit requests by September during the model year. Manufacturers will also be required to meet the proposed deadlines or be subject an enforcement action. Unless an extension is granted by NHTSA for good cause, a manufacturer will be precluded from claiming any off-menu items not timely submitted. Failure to request extensions or meet negotiated deadlines will be subject to enforcement action in compliance with 49 U.S.C. 32912(a).

To further streamline the process of reviews, NHTSA also proposes to work with EPA to create a quicker process for adding off-cycle technologies to the predetermined menu list if widely approved for multiple manufacturers. For example, the agencies added high-efficiency alternators and advanced A/C compressors to the menu allowing manufacturers to select the menu credit rather than continuing to seek credits through the public approval process. High-efficiency alternators were added to the off-cycle credits menu, and advanced A/C compressors with a variable crankcase valve were added to the menu for A/C efficiency credits. The credit levels are based on data previously submitted by multiple manufacturers through the off-cycle

credits application process. The high efficiency alternator credit is scalable with efficiency, providing an increasing credit value of 0.16 grams/mile CO<sub>2</sub> per percent improvement as the efficiency of the alternator increases above a baseline level of 67 percent efficiency. The advanced A/C compressor credit value is 1.1 grams/mile for both cars and light trucks.<sup>548</sup>

#### (ii) Safety Assessment

In the 2016 heavy-duty fuel economy rule (81 FR 73478, October 25, 2016), NHTSA adopted provisions preventing manufacturers from receiving credits for technology that impair safety—whether due to a defect, negatively affecting a FMVSS, or other safety reasons.<sup>549</sup> Additionally, NHTSA clarified that technologies that do not provide fuel savings as intended will also be stripped of credits. To harmonize the light-duty and heavy-duty off-cycle programs, NHTSA is proposing to adopt these provisions for the light-duty CAFE program. While the agency encourages fuel economy innovations, safety remains NHTSA’s primary mission and any technology applied for CAFE-purposes should not impair safety. Furthermore, adopting these requirements for the light-duty fleet will harmonize it with the heavy-duty regulations.

#### (iii) Menu Credit Cap

Due to the uncertainties associated with combining menu technologies and the fact that some uncertainty is introduced because off-cycle credits are provided based on a general assessment of off-cycle performance, as opposed to testing on the individual vehicle models, EPA established caps that limit the amount of credits a manufacturer may generate using the EPA menu list. Off-cycle technology is capped at 10 grams/mile per year on a combined car and truck fleet-wide average basis. In its concurrent proposal for MYs 2023–2026 GHG standards (86 FR 43726, August 10, 2021), EPA is proposing to increase the off-cycle menu cap from 10 grams CO<sub>2</sub>/mile to 15 grams CO<sub>2</sub>/mile beginning with MY 2023. EPA also proposes to revise the definitions for passive cabin ventilation and active engine and transmission warm-up beginning in MY 2023, as discussed in the next following sections. Furthermore, EPA is proposing, for MYs

<sup>548</sup> For additional details regarding the derivation of these credits, see EPA’s Memorandum to Docket EPA–HQ–OAR–2018–0283 (“Potential Off-cycle Menu Credit Levels and Definitions for High Efficiency Alternators and Advanced Air Conditioning Compressors”).

<sup>549</sup> See 49 CFR 535.7(f)(2)(iii).

2020–2022, to allow manufacturers to use the cap of 15 g/mi if the revised definitions are met for these technologies. NHTSA is proposing to adopt these same provisions for the CAFE programs as a part of this rulemaking. No caps were established for technologies gaining credits through the petitioning or 5-cycle approval methodologies and the agency is not proposing to add caps in these areas.

(iv) Proposal To Update the Menu Technology Definitions

(a) Passive Cabin Ventilation

Some manufacturers have claimed off-cycle credits for passive ventilation cabin technologies based on the addition of software logic to their HVAC system that sets the dash vent to the open position when the power to vehicle is turned off at higher ambient temperatures. The manufacturers have indicated that the opening of the vent allows for the flow of ambient temperature air into the cabin. While ensuring that the interior of the vehicle is open for flow into the cabin, by only opening the dash vent no other action is taken to improve the flow of heated air out of the vehicle. This technology relies on the pressure in the cabin to reach a sufficient level for the heated air in the interior to flow out through body leaks or the body exhausters open and vent heated air out of the cabin.

The credits for passive cabin ventilation were determined based on an National Renewable Energy Laboratory (NREL) study that strategically opened a sunroof to allow for the unrestricted flow of heated air to exit the interior of the vehicle while combined with additional floor openings to provide a minimally restricted entry for cooler ambient air to enter the cabin.<sup>550</sup> The modifications NREL performed on the vehicle reduced the flow restrictions for both heated cabin air to exit the vehicle and cooler ambient air to enter the vehicle, creating a convective airflow path through the vehicle cabin.

Analytical studies performed by manufacturers to evaluate the performance of the open dash vent demonstrate that while the dash vent may allow for additional airflow of ambient temperature air entering the cabin, it does not reduce the existing restrictions on heated cabin air exiting the vehicle. Opening the dash vent primarily relies on body leaks and

occasional venting of the heated cabin air through the body exhausters for the higher temperature cabin air to be vented from the vehicle. While this does provide some reduction in cabin temperatures this technology is not as effective as the combination of vents used by the NREL researchers to allow additional ambient temperature air to enter the cabin and also to reduce the restriction of heated air exiting the cabin.

As noted in the Joint Technical Support Document: Final Rulemaking for 2017–2025 Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards,<sup>551</sup> pg. 584, “For passive ventilation technologies, such as opening of windows and/or sunroofs and use of floor vents to supply fresh air to the cabin (which enhances convective airflow), (1.7 grams/mile for LDVs and 2.3 grams/mile for LDTs) a cabin air temperature reduction of 5.7 °C can be realized.” The passive cabin ventilation credit values were based on achieving the 5.7 °C cabin temperature reduction.

EPA and NHTSA have decided to revise the passive cabin ventilation definition to make it consistent with the technology used to generate the credit value. NHTSA supports EPA’s proposal to revise the definition of passive cabin ventilation to only include methods which create and maintain convective airflow through the body’s cabin by opening windows or a sunroof, or equivalent means of creating and maintaining convective airflow, when the vehicle is parked outside in direct sunlight.

Current systems claiming the passive ventilation credit by opening the dash vent would no longer meet the updated definition. Manufacturers seeking to claim credits for the open dash vent system will be eligible to petition the agency for credits for this technology using the alternative EPA approved method outlined in § 86.1869–12(d).

(b) Active Engine and Transmission Warmup

NHTSA, in coordination with EPA, is proposing to revise the menu definitions of active engine and transmission warm-up to no longer allow systems that capture heat from the coolant circulating in the engine block prior to the opening of the thermostat to qualify for the Active Engine and Active Transmission warm-up menu credits.

The agency would allow credit for coolant systems that capture heat from a liquid-cooled exhaust manifold if the system is segregated from the coolant loop in the engine block. The agency would also allow system design that captures and routes waste heat from the exhaust to the engine or transmission as this was the basis for these two credits as originally proposed in the NPRM to the 2017 to 2025 GHG rulemaking (76 FR 74854, Dec. 1, 2011).

Manufacturers seeking to utilize their existing systems that capture coolant heat before the engine is fully warmed-up and transfer this heat to the engine oil and transmission fluid would remain eligible to seek credits through the alternative method application process outlined in § 86.1869–12(d). These technologies may provide some benefit, however, as noted above as these system designs remove heat that is needed to warmup the engine may be less effective than those that capture and utilize exhaust waste heat.

### VIII. Public Participation

NHTSA requests comments on all aspects of this NPRM. This section describes how you can participate in this process.

*How do I prepare and submit comments?*

Your comments must be written and in English.<sup>552</sup> To ensure that your comments are correctly filed in the docket, please include the docket number NHTSA–2021–0053 in your comments. Your comments must not be more than 15 pages long.<sup>553</sup> NHTSA established this limit to encourage you to write your primary comments in a concise fashion. However, you may attach necessary additional documents to your comments, and there is no limit on the length of the attachments. If you are submitting comments electronically as a PDF (Adobe) file, we ask that the documents please be scanned using the Optical Character Recognition (OCR) process, thus allowing NHTSA to search and copy certain portions of your submissions.<sup>554</sup> Please note that pursuant to the Data Quality Act, in order for substantive data to be relied upon and used by the agency, it must meet the information quality standards set forth in the OMB and DOT Data Quality Act guidelines. Accordingly, we encourage you to consult the guidelines in preparing your comments. OMB’s

<sup>550</sup> Rugh, J., Chaney, L., Lustbader, J., and Meyer, J., “Reduction in Vehicle Temperatures and Fuel Use from Cabin Ventilation, Solar-Reflective Paint, and a New Solar-Reflective Glazing,” SAE Technical Paper 2007–01–1194, 2007.

guidelines may be accessed at <https://www.gpo.gov/fdsys/pkg/FR-2002-02-22/pdf/R2-59.pdf>. DOT's guidelines may be accessed at <https://www.transportation.gov/dot-information-dissemination-quality-guidelines>.

#### *Tips for Preparing Your Comments*

When submitting comments, please remember to:

- Identify the rulemaking by docket number and other identifying information (subject heading, **Federal Register** date and page number).
- Explain why you agree or disagree, suggest alternatives, and substitute language for your requested changes.
- Describe any assumptions and provide any technical information and/or data that you used.
- If you estimate potential costs or burdens, explain how you arrived at your estimate in sufficient detail to allow for it to be reproduced.
- Provide specific examples to illustrate your concerns and suggest alternatives.
- Explain your views as clearly as possible, avoiding the use of profanity or personal threats.
- Make sure to submit your comments by the comment period deadline identified in the **DATES** section above.

#### *How can I be sure that my comments were received?*

If you submit your comments to NHTSA's docket by mail and wish DOT Docket Management to notify you upon receipt of your comments, please enclose a self-addressed, stamped postcard in the envelope containing your comments. Upon receiving your comments, Docket Management will return the postcard by mail.

#### *How do I submit confidential business information?*

If you wish to submit any information any information under a claim of confidentiality, you should submit three copies of your complete submission, including the information you claim to be confidential business information, to the Chief Counsel, NHTSA, at the address given above under **FOR FURTHER INFORMATION CONTACT**. When you send a comment containing confidential business information, you should include a cover letter setting forth the information specified in 49 CFR part 512.

In addition, you should submit a copy from which you have deleted the claimed confidential business information to the Docket by one of the methods set forth above.

#### *Will NHTSA consider late comments?*

NHTSA will consider all comments received before the close of business on the comment closing date indicated above under **DATES**. To the extent practicable, we will also consider comments received after that date. If interested persons believe that any information that the agency places in the docket after the issuance of the NPRM affects their comments, they may submit comments after the closing date concerning how the agency should consider that information for the final rule. However, the agency's ability to consider any such late comments in this rulemaking will be limited due to the time frame for issuing a final rule.

If a comment is received too late for us to practicably consider in developing a final rule, we will consider that comment as an informal suggestion for future rulemaking action.

#### *How can I read the comments submitted by other people?*

You may read the materials placed in the dockets for this document (e.g., the comments submitted in response to this document by other interested persons) at any time by going to <https://www.regulations.gov>. Follow the online instructions for accessing the dockets. You may also read the materials at the DOT Docket Management Facility by going to the street address given above under **ADDRESSES**.

#### *How do I participate in the public hearings?*

NHTSA will hold one virtual public hearing during the public comment period. The agency will announce the specific date and web address for the hearing in a supplemental **Federal Register** notification. The agency will accept oral and written comments to the rulemaking documents and will also accept comments to the Supplemental Environmental Impact Statement (SEIS) at this hearing. The hearing will start at 9 a.m. Eastern standard time and continue until everyone has had a chance to speak.

NHTSA will conduct the hearing informally, and technical rules of evidence will not apply. We will arrange for a written transcript of each hearing to be posted in the dockets as soon as it is available and keep the official record of the hearing open for 30 days following the hearing to allow you to submit supplementary information.

*The Draft Supplemental Environmental Impact Statement (SEIS) associated with this proposal has a unique public docket number and is available in Docket No. NHTSA-2021-0054.*

Comments on the Draft SEIS can be submitted electronically at <http://www.regulations.gov>, in Docket No. NHTSA-2021-0054. You may also mail or hand deliver comments to Docket Management, U.S. Department of Transportation, 1200 New Jersey Avenue SE, Room W12-140, Washington, DC 20590 (referencing Docket No. NHTSA-2021-0054), between 9 a.m. and 5 p.m., Monday through Friday, except on Federal holidays. To be sure someone is there to help you, please call (202) 366-9322 before coming. All comments and materials received, including the names and addresses of the commenters who submit them, will become part of the administrative record and will be posted on the web at <http://www.regulations.gov>.

## **IX. Regulatory Notices and Analyses**

### *A. Executive Order 12866, Executive Order 13563*

Executive Order 12866, "Regulatory Planning and Review" (58 FR 51735, Oct. 4, 1993), as amended by Executive Order 13563, "Improving Regulation and Regulatory Review" (76 FR 3821, Jan. 21, 2011), provides for making determinations whether a regulatory action is "significant" and therefore subject to the Office of Management and Budget (OMB) review process and to the requirements of the Executive Order. Under these Executive orders, this action is an "economically significant regulatory action" because it is likely to have an annual effect on the economy of \$100 million or more. Accordingly, NHTSA submitted this action to OMB for review and any changes made in response to OMB recommendations have been documented in the docket for this action. The benefits and costs of this proposal are described above and in the Preliminary Regulatory Impact Analysis (PRIA), which is located in the docket and on NHTSA's website.

### *B. DOT Regulatory Policies and Procedures*

This proposal is also significant within the meaning of the Department of Transportation's Regulatory Policies and Procedures. The benefits and costs of the proposal are described above and in the PRIA, which is located in the docket and on NHTSA's website.

### *C. Executive Order 13990*

Executive Order 13990, "Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis" (86 FR 7037, Jan. 25, 2021), directed the immediate review of "The Safer Affordable Fuel-Efficient (SAFE)

Vehicles Rule for Model Years 2021–2026 Passenger Cars and Light Trucks” (the 2020 final rule) by July 2021. The Executive order directed that “In considering whether to propose suspending, revising, or rescinding that rule, the agency [*i.e.*, NHTSA] should consider the views of representatives from labor unions, States, and industry.”

This proposal follows the review directed in this Executive order. Promulgated under NHTSA’s statutory authorities, it proposes new CAFE standards for the model years covered by the 2020 final rule for which there is still available lead time to change, and it accounts for the views provided by labor unions, States, and industry.

#### D. Environmental Considerations

##### 1. National Environmental Policy Act (NEPA)

Concurrently with this NPRM, NHTSA is issuing a Supplemental Environmental Impact Statement (SEIS), pursuant to the National Environmental Policy Act, 42 U.S.C. 4321–4347, and implementing regulations issued by the Council on Environmental Quality (CEQ), 40 CFR part 1500, and NHTSA, 49 CFR part 520. NHTSA prepared the SEIS to analyze and disclose the potential environmental impacts of the proposed CAFE standards and a range of alternatives. The SEIS analyzes direct, indirect, and cumulative impacts and analyzes impacts in proportion to their significance.

The SEIS describes potential environmental impacts to a variety of resources, including fuel and energy use, air quality, climate, land use and development, hazardous materials and regulated wastes, historical and cultural resources, noise, and environmental justice. The SEIS also describes how climate change resulting from global carbon dioxide emissions (including CO<sub>2</sub> emissions attributable to the U.S. light-duty transportation sector under the alternatives considered) could affect certain key natural and human resources. Resource areas are assessed qualitatively and quantitatively, as appropriate, in the SEIS.

NHTSA has considered the information contained in the SEIS as part of developing this proposal. The SEIS is available for public comment; instructions for the submission of comments are included inside the document. NHTSA will simultaneously issue the Final Environmental Impact Statement and Record of Decision, pursuant to 49 U.S.C. 304a(b), unless it is determined that statutory criteria or practicability considerations preclude

simultaneous issuance. For additional information on NHTSA’s NEPA analysis, please see the SEIS.

##### 2. Clean Air Act (CAA) as Applied to NHTSA’s Proposal

The CAA (42 U.S.C. 7401 *et seq.*) is the primary Federal legislation that addresses air quality. Under the authority of the CAA and subsequent amendments, EPA has established National Ambient Air Quality Standards (NAAQS) for six criteria pollutants, which are relatively commonplace pollutants that can accumulate in the atmosphere as a result of human activity. EPA is required to review each NAAQS every five years and to revise those standards as may be appropriate considering new scientific information.

The air quality of a geographic region is usually assessed by comparing the levels of criteria air pollutants found in the ambient air to the levels established by the NAAQS (taking into account, as well, the other elements of a NAAQS: Averaging time, form, and indicator). Concentrations of criteria pollutants within the air mass of a region are measured in parts of a pollutant per million parts (ppm) of air or in micrograms of a pollutant per cubic meter (µg/m<sup>3</sup>) of air present in repeated air samples taken at designated monitoring locations using specified types of monitors. These ambient concentrations of each criteria pollutant are compared to the levels, averaging time, and form specified by the NAAQS in order to assess whether the region’s air quality is in attainment with the NAAQS.

When the measured concentrations of a criteria pollutant within a geographic region are below those permitted by the NAAQS, EPA designates the region as an attainment area for that pollutant, while regions where concentrations of criteria pollutants exceed Federal standards are called nonattainment areas. Former nonattainment areas that are now in compliance with the NAAQS are designated as maintenance areas. Each State with a nonattainment area is required to develop and implement a State Implementation Plan (SIP) documenting how the region will reach attainment levels within time periods specified in the CAA. For maintenance areas, the SIP must document how the State intends to maintain compliance with the NAAQS. When EPA revises a NAAQS, each State must revise its SIP to address how it plans to attain the new standard.

No Federal agency may “engage in, support in any way or provide financial assistance for, license or permit, or approve” any activity that does not

“conform” to a SIP or Federal Implementation Plan after EPA has approved or promulgated it.<sup>555</sup> Further, no Federal agency may “approve, accept, or fund” any transportation plan, program, or project developed pursuant to title 23 or chapter 53 of title 49, U.S.C., unless the plan, program or project has been found to “conform” to any applicable implementation plan in effect.<sup>556</sup> The purpose of these conformity requirements is to ensure that Federally sponsored or conducted activities do not interfere with meeting the emissions targets in SIPs, do not cause or contribute to new violations of the NAAQS, and do not impede the ability of a State to attain or maintain the NAAQS or delay any interim milestones. EPA has issued two sets of regulations to implement the conformity requirements:

(1) The Transportation Conformity Rule<sup>557</sup> applies to transportation plans, programs, and projects that are developed, funded, or approved under title 23 or chapter 53 of title 49, U.S.C.

(2) The General Conformity Rule<sup>558</sup> applies to all other Federal actions not covered under transportation conformity. The General Conformity Rule establishes emissions thresholds, or de minimis levels, for use in evaluating the conformity of an action that results in emissions increases.<sup>559</sup> If the net increases of direct and indirect emissions exceed any of these thresholds, and the action is not otherwise exempt, then a conformity determination is required. The conformity determination can entail air quality modeling studies, consultation with EPA and State air quality agencies, and commitments to revise the SIP or to implement measures to mitigate air quality impacts.

The proposed CAFE standards and associated program activities are not developed, funded, or approved under title 23 or chapter 53 of title 49, U.S.C. Accordingly, this action and associated program activities are not subject to transportation conformity. Under the General Conformity Rule, a conformity determination is required where a Federal action would result in total direct and indirect emissions of a criteria pollutant or precursor originating in nonattainment or maintenance areas equaling or exceeding the rates specified in 40 CFR 93.153(b)(1) and (2). As explained

<sup>555</sup> 42 U.S.C. 7506(c)(1).

<sup>556</sup> 42 U.S.C. 7506(c)(2).

<sup>557</sup> 40 CFR part 51, subpart T, and part 93, subpart A.

<sup>558</sup> 40 CFR part 51, subpart W, and part 93, subpart B.

<sup>559</sup> 40 CFR 93.153(b).

below, NHTSA's proposed action results in neither direct nor indirect emissions as defined in 40 CFR 93.152.

The General Conformity Rule defines direct emissions as "those emissions of a criteria pollutant or its precursors that are caused or initiated by the Federal action and originate in a nonattainment area and occur at the same time and place as the action and are reasonably foreseeable."<sup>560</sup> NHTSA's proposed action would set fuel economy standards for light-duty vehicles. It therefore would not cause or initiate direct emissions consistent with the meaning of the General Conformity Rule.<sup>561</sup> Indeed, the proposal in aggregate reduces emissions, and to the degree the model predicts small (and time-limited) increases, these increases are based on a theoretical response by individuals to fuel economy prices and savings, which are at best indirect.

Indirect emissions under the General Conformity Rule are those emissions of a criteria pollutant or its precursors: That are caused or initiated by the Federal action and originate in the same nonattainment or maintenance area but occur at a different time or place as the action; that are reasonably foreseeable; that the agency can practically control; and for which the agency has continuing program responsibility.<sup>562</sup> Each element of the definition must be met to qualify as indirect emissions. NHTSA has determined that, for purposes of general conformity, emissions (if any) that may result from the proposed fuel economy standards would not be caused by NHTSA's action, but rather would occur because of subsequent activities the agency cannot practically control. "[E]ven if a Federal licensing, rulemaking, or other approving action is a required initial step for a subsequent activity that causes emissions, such initial steps do not mean that a Federal agency can practically control any resulting emissions."<sup>563</sup>

As the CAFE program uses performance-based standards, NHTSA cannot control the technologies vehicle manufacturers use to improve the fuel economy of passenger cars and light trucks. Furthermore, NHTSA cannot control consumer purchasing (which

affects average achieved fleetwide fuel economy) and driving behavior (*i.e.*, operation of motor vehicles, as measured by VMT). It is the combination of fuel economy technologies, consumer purchasing, and driving behavior that results in criteria pollutant or precursor emissions. For purposes of analyzing the environmental impacts of the proposal and alternatives under NEPA, NHTSA has made assumptions and estimates regarding all of these factors. The agency's SEIS projects that increases in air toxics and criteria pollutants would occur in some nonattainment areas under certain alternatives in the near term, although over the longer term, all action alternatives see improvements. However, the proposed standards and alternatives do not mandate specific manufacturer decisions, consumer purchasing, or driver behavior, and NHTSA cannot practically control any of them.<sup>564</sup>

In addition, NHTSA does not have the statutory authority to control the actual VMT by drivers. As the extent of emissions depends directly on the operation of motor vehicles, changes in any emissions that could result from NHTSA's proposed standards are not changes the agency can practically control or for which the agency has continuing program responsibility. Therefore, the proposed standards and alternative standards considered by NHTSA would not cause indirect emissions under the General Conformity Rule, and a general conformity determination is not required.

### 3. National Historic Preservation Act (NHPA)

The NHPA (54 U.S.C. 300101 *et seq.*) sets forth Government policies and procedures regarding "historic properties"—that is, districts, sites, buildings, structures, and objects included on or eligible for the National Register of Historic Places. Section 106 of the NHPA requires Federal agencies to "take into account" the effects of their actions on historic properties.<sup>565</sup> NHTSA concludes that the NHPA is not applicable to this proposal because the promulgation of CAFE standards for light-duty vehicles is not the type of activity that has the potential to cause effects on historic properties. However, NHTSA includes a brief, qualitative discussion of the impacts of the

alternatives on historical and cultural resources in the SEIS.

### 4. Fish and Wildlife Conservation Act (FWCA)

The FWCA (16 U.S.C. 2901 *et seq.*) provides financial and technical assistance to States for the development, revision, and implementation of conservation plans and programs for nongame fish and wildlife. In addition, the Act encourages all Federal departments and agencies to utilize their statutory and administrative authorities to conserve and to promote conservation of nongame fish and wildlife and their habitats. NHTSA concludes that the FWCA does not apply to this proposal because it does not involve the conservation of nongame fish and wildlife and their habitats.

### 5. Coastal Zone Management Act (CZMA)

The Coastal Zone Management Act (16 U.S.C. 1451 *et seq.*) provides for the presentation, protection, development, and (where possible) restoration and enhancement of the Nation's coastal zone resources. Under the statute, States are provided with funds and technical assistance in developing coastal zone management programs. Each participating State must submit its program to the Secretary of Commerce for approval. Once the program has been approved, any activity of a Federal agency, either within or outside of the coastal zone, that affects any land or water use or natural resource of the coastal zone must be carried out in a manner that is consistent, to the maximum extent practicable, with the enforceable policies of the State's program.<sup>566</sup>

NHTSA concludes that the CZMA does not apply to this proposal because it does not involve an activity within, or outside of, the Nation's coastal zones that affects any land or water use or natural resource of the coastal zone. NHTSA has, however, conducted a qualitative review in its SEIS of the related direct, indirect, and cumulative impacts, positive or negative, of all the alternatives on potentially affected resources, including coastal zones.

### 6. Endangered Species Act (ESA)

Under Section 7(a)(2) of the ESA, Federal agencies must ensure that actions they authorize, fund, or carry out are "not likely to jeopardize the continued existence" of any federally listed threatened or endangered species or result in the destruction or adverse

<sup>560</sup> 40 CFR 93.152.

<sup>561</sup> *Dep't of Transp. v. Pub. Citizen*, 541 U.S. at 772 ("[T]he emissions from the Mexican trucks are not 'direct' because they will not occur at the same time or at the same place as the promulgation of the regulations.") NHTSA's action is to establish fuel economy standards for MYs 2024–2026 passenger cars and light trucks; an emissions increase, if any, would occur in a different place and well after promulgation of an eventual final rule.

<sup>562</sup> 40 CFR 93.152.

<sup>563</sup> *Id.*

<sup>564</sup> *See, e.g., Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752, 772–73 (2004); *South Coast Air Quality Management District v. Federal Energy Regulatory Commission*, 621 F.3d 1085, 1101 (9th Cir. 2010).

<sup>565</sup> Section 106 is codified at 54 U.S.C. 306108. Implementing regulations for the Section 106 process are located at 36 CFR part 800.

<sup>566</sup> 16 U.S.C. 1456(c)(1)(A).

modification of the designated critical habitat of these species.<sup>567</sup> If a Federal agency determines that an agency action may affect a listed species or designated critical habitat, it must initiate consultation with the appropriate Service—the U.S. Fish and Wildlife Service of the Department of the Interior and/or the National Oceanic and Atmospheric Administration’s National Marine Fisheries Service of the Department of Commerce, depending on the species involved—in order to ensure that the action is not likely to jeopardize the species or destroy or adversely modify designated critical habitat.<sup>568</sup> Under this standard, the Federal agency taking action evaluates the possible effects of its action and determines whether to initiate consultation.<sup>569</sup>

Pursuant to Section 7(a)(2) of the ESA, NHTSA has considered the effects of the proposed standards and has reviewed applicable ESA regulations, case law, and guidance to determine what, if any, impact there might be to listed species or designated critical habitat. NHTSA has considered issues related to emissions of CO<sub>2</sub> and other GHGs, and issues related to non-GHG emissions. Based on this assessment, NHTSA determines that the action of setting CAFE standards does not require consultation under Section 7(a)(2) of the ESA. Accordingly, NHTSA has concluded its review of this action under Section 7 of the ESA.

#### 7. Floodplain Management (Executive Order 11988 and DOT Order 5650.2)

These orders require Federal agencies to avoid the long- and short-term adverse impacts associated with the occupancy and modification of floodplains, and to restore and preserve the natural and beneficial values served by floodplains. Executive Order 11988 also directs agencies to minimize the impacts of floods on human safety, health and welfare, and to restore and preserve the natural and beneficial values served by floodplains through evaluating the potential effects of any actions the agency may take in a floodplain and ensuring that its program planning and budget requests reflect consideration of flood hazards and floodplain management. DOT Order 5650.2 sets forth DOT policies and procedures for implementing Executive Order 11988. The DOT order requires that the agency determine if a proposed action is within the limits of a base floodplain, meaning it is encroaching on the floodplain, and whether this

encroachment is significant. If significant, the agency is required to conduct further analysis of the proposed action and any practicable alternatives. If a practicable alternative avoids floodplain encroachment, then the agency is required to implement it.

In this proposal, NHTSA is not occupying, modifying, and/or encroaching on floodplains. NHTSA therefore concludes that the orders do not apply to this proposal. NHTSA has, however, conducted a review of the alternatives on potentially affected resources, including floodplains, in its SEIS.

#### 8. Preservation of the Nation’s Wetlands (Executive Order 11990 and DOT Order 5660.1a)

These orders require Federal agencies to avoid, to the extent possible, undertaking or providing assistance for new construction located in wetlands unless the agency head finds that there is no practicable alternative to such construction and that the proposed action includes all practicable measures to minimize harms to wetlands that may result from such use. Executive Order 11990 also directs agencies to take action to minimize the destruction, loss, or degradation of wetlands in “conducting Federal activities and programs affecting land use, including but not limited to water and related land resources planning, regulating, and licensing activities.” DOT Order 5660.1a sets forth DOT policy for interpreting Executive Order 11990 and requires that transportation projects “located in or having an impact on wetlands” should be conducted to assure protection of the Nation’s wetlands. If a project does have a significant impact on wetlands, an EIS must be prepared.

NHTSA is not undertaking or providing assistance for new construction located in wetlands. NHTSA therefore concludes that these orders do not apply to this proposal. NHTSA has, however, conducted a review of the alternatives on potentially affected resources, including wetlands, in its SEIS.

#### 9. Migratory Bird Treaty Act (MTBA), Bald and Golden Eagle Protection Act (BGEPA), Executive Order 13186

The MTBA (16 U.S.C. 703–712) provides for the protection of certain migratory birds by making it illegal for anyone to “pursue, hunt, take, capture, kill, attempt to take, capture, or kill, possess, offer for sale, sell, offer for barter, barter, offer to purchase, purchase, deliver for shipment, ship, export, import, cause to be shipped, exported, or imported, deliver for

transportation, carry or cause to be carried, or receive for shipment, transportation, carriage, or export” any migratory bird covered under the statute.<sup>570</sup>

The BGEPA (16 U.S.C. 668–668d) makes it illegal to “take, possess, sell, purchase, barter, offer to sell, purchase or barter, transport, export or import” any bald or golden eagles.<sup>571</sup> Executive Order 13186, “Responsibilities of Federal Agencies to Protect Migratory Birds,” helps to further the purposes of the MBTA by requiring a Federal agency to develop a Memorandum of Understanding (MOU) with the Fish and Wildlife Service when it is taking an action that has (or is likely to have) a measurable negative impact on migratory bird populations.

NHTSA concludes that the MBTA, BGEPA, and Executive Order 13186 do not apply to this proposal because there is no disturbance, take, measurable negative impact, or other covered activity involving migratory birds or bald or golden eagles involved in this rulemaking.

#### 10. Department of Transportation Act (Section 4(f))

Section 4(f) of the Department of Transportation Act of 1966 (49 U.S.C. 303), as amended, is designed to preserve publicly owned park and recreation lands, waterfowl and wildlife refuges, and historic sites. Specifically, Section 4(f) provides that DOT agencies cannot approve a transportation program or project that requires the use of any publicly owned land from a public park, recreation area, or wildlife or waterfowl refuge of national, State, or local significance, unless a determination is made that:

(1) There is no feasible and prudent alternative to the use of land, and

(2) The program or project includes all possible planning to minimize harm to the property resulting from the use.

These requirements may be satisfied if the transportation use of a Section 4(f) property results in a de minimis impact on the area.

NHTSA concludes that Section 4(f) does not apply to this proposal because this rulemaking is not an approval of a transportation program nor project that requires the use of any publicly owned land.

<sup>567</sup> 16 U.S.C. 1536(a)(2).

<sup>568</sup> See 50 CFR 402.14.

<sup>569</sup> See 51 FR 9926, 19949 (Jun. 3, 1986).

<sup>570</sup> 16 U.S.C. 703(a).

<sup>571</sup> 16 U.S.C. 668(a).

11. Executive Order 12898: “Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations”

Executive Order 12898, “Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations” (Feb. 16, 1994), directs Federal agencies to “promote nondiscrimination in federal programs substantially affecting human health and the environment, and provide minority and low-income communities access to public information on, and an opportunity for public participation in, matters relating to human health or the environment.” E.O. 12898 also directs agencies to identify and consider any disproportionately high and adverse human health or environmental effects that their actions might have on minority and low-income communities and provide opportunities for community input in the NEPA process. CEQ has provided agencies with general guidance on how to meet the requirements of the E.O. as it relates to NEPA. A White House Environmental Justice Interagency Council established under E.O. 14008, “Tackling the Climate Crisis at Home and Abroad,” is expected to advise CEQ on ways to update E.O. 12898, including the expansion of environmental justice advice and recommendations. The White House Environmental Justice Interagency Council will advise on increasing environmental justice monitoring and enforcement.

Additionally, the 2021 DOT Order 5610.2(c), “U.S. Department of Transportation Actions to Address Environmental Justice in Minority Populations and Low-Income Populations” (May 14, 2021), describes the process for DOT agencies to incorporate environmental justice principles in programs, policies, and activities. The DOT’s Environmental Justice Strategy specifies that environmental justice and fair treatment of all people means that no population be forced to bear a disproportionate burden due to transportation decisions, programs, and policies. It also defines the term *minority* and *low-income* in the context of DOT’s environmental justice analyses. *Minority* is defined as a person who is Black, Hispanic or Latino, Asian American, American Indian or Alaskan Native, or Native Hawaiian or other Pacific Islander. *Low-income* is defined

as a person whose household income is at or below the Department of Health and Human Services poverty guidelines. Low-income and minority populations may live in geographic proximity or be geographically dispersed/transient. In 2021, DOT reviewed and updated its environmental justice strategy to ensure that it continues to reflect its commitment to environmental justice principles and integrating those principles into DOT programs, policies, and activities.

Section VI and the SEIS discuss NHTSA’s consideration of environmental justice issues associated with this proposal.

12. Executive Order 13045: “Protection of Children From Environmental Health Risks and Safety Risks”

This action is subject to Executive Order 13045 (62 FR 19885, Apr. 23, 1997) because it is an economically significant regulatory action as defined by E.O. 12866, and NHTSA has reason to believe that the environmental health and safety risks related to this action, although small, may have a disproportionate effect on children. Specifically, children are more vulnerable to adverse health effects related to mobile source emissions, as well as to the potential long-term impacts of climate change. Pursuant to E.O. 13045, NHTSA must prepare an evaluation of the environmental health or safety effects of the planned regulation on children and an explanation of why the planned regulation is preferable to other potentially effect and reasonably feasible alternatives considered by NHTSA. Further, this analysis may be included as part of any other required analysis.

All of the action alternatives would reduce CO<sub>2</sub> emissions relative to the baseline and thus have positive effects on mitigating global climate change, and thus environmental and health effects associated with climate change. While environmental and health effects associated with criteria pollutant and toxic air pollutant emissions vary over time and across alternatives, negative effects, when estimated, are extremely small. This preamble and the SEIS discuss air quality, climate change, and their related environmental and health effects, noting where these would disproportionately affect children. In addition, Section VI of this preamble explains why NHTSA believes that the

proposed standards are preferable to other alternatives considered.

E. Regulatory Flexibility Act

Pursuant to the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*, as amended by the Small Business Regulatory Enforcement Fairness Act (SBREFA) of 1996), whenever an agency is required to publish a notice of proposed rulemaking or final rule, it must prepare and make available for public comment a regulatory flexibility analysis that describes the effect of the rule on small entities (*i.e.*, small businesses, small organizations, and small governmental jurisdictions). No regulatory flexibility analysis is required if the head of an agency certifies the rule will not have a significant economic impact on a substantial number of small entities. SBREFA amended the Regulatory Flexibility Act to require Federal agencies to provide a statement of the factual basis for certifying that a rule will not have a significant economic impact on a substantial number of small entities.

NHTSA has considered the impacts of this proposed rule under the Regulatory Flexibility Act and certifies that this proposed rule would not have a significant economic impact on a substantial number of small entities. The following is NHTSA’s statement providing the factual basis for this certification pursuant to 5 U.S.C. 605(b).

Small businesses are defined based on the North American Industry Classification System (NAICS) code.<sup>572</sup> One of the criteria for determining size is the number of employees in the firm. For establishments primarily engaged in manufacturing or assembling automobiles, as well as light duty trucks, the firm must have less than 1,500 employees to be classified as a small business. This rule would affect motor vehicle manufacturers. As shown in Table IX–1, the agency have identified 13 small manufacturers of passenger cars, light trucks, and SUVs of electric, hybrid, and internal combustion engines. NHTSA acknowledges that some newer manufacturers may not be listed. However, those new manufacturers tend to have transportation products that are not part of the light-duty vehicle fleet and have yet to start production of light-duty vehicles. Moreover, NHTSA does not believe that there are a “substantial number” of these newer companies.<sup>573</sup>

<sup>572</sup> Classified in NAICS under Subsector 336—Transportation Equipment Manufacturing for Automobile Manufacturing (336111), Light Truck

(336112), and Heavy Duty Truck Manufacturing (336120). <https://www.sba.gov/document/support-table-size-standards>.

<sup>573</sup> 5 U.S.C. 605(b).

Table IX-1 – Small Domestic Vehicle Manufacturers

Manufacturers	Founded	Employees <sup>574</sup>	Estimated Annual Production <sup>575</sup>	Sale Price per Unit
Karma Automotive	2014	< 1,000	<100	\$95,000 to \$120,000
BXR Motors	2008	< 10	< 100	\$155,000 to \$185,000
Falcon Motorsports	2009	< 10	< 100	\$300,000 to \$400,000
Lucra Cars	2005	< 50	< 100	\$70,000 to \$220,000
Lyons Motor Car	2012	< 10	< 100	\$1,400,000
Rezvani Motors	2014	< 10	< 100	\$155,000 to \$260,000
Rossion Automotive	2007	< 50	< 100	\$90,000
Saleen	1984	< 200	< 100	\$100,000
Shelby American	1962	< 200	< 100	\$60,000 to \$250,000
Panoz	1988	< 50	< 100	\$155,000 to \$175,000
Faraday Future	2014	< 1,000	0	\$200,000 to \$300,000
SF Motors	2016	< 500	0	N/A
Workhorse Group	2007	< 200	0	\$52,000
Lordstown Motors	2019	<1,000	0	\$52,500

NHTSA believes that the proposed rulemaking would not have a significant economic impact on the small vehicle manufacturers because under 49 CFR part 525, passenger car manufacturers building fewer than 10,000 vehicles per year can petition NHTSA to have alternative standards set for those manufacturers. Listed manufacturers producing ICE vehicles do not currently meet the standard and must already petition the agency for relief. If the standard is raised, it has no meaningful impact on these manufacturers—they still must go through the same process and petition for relief. Given there already is a mechanism for relieving burden on small businesses, which is the purpose of the Regulatory Flexibility Act, a regulatory flexibility analysis was not prepared.

Further, small manufacturers of electric vehicles would not face a significant economic impact. The method for earning credits applies equally across manufacturers and does not place small entities at a significant competitive disadvantage. In any event, even if the rule had a “significant economic impact” on these small EV manufacturers, the amount of these companies is not “a substantial number.”<sup>576</sup> For these reasons, their existence does not alter the agency’s analysis of the applicability of the Regulatory Flexibility Act.

<sup>574</sup> Estimated number of employees as of June 2021, source: *LinkedIn.com* and other websites reporting company profiles.

<sup>575</sup> Rough estimate of light duty vehicle production for model year 2020.

#### F. Executive Order 13132 (Federalism)

Executive Order 13132 requires Federal agencies to develop an accountable process to ensure “meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications. The order defines the term “[p]olicies that have federalism implications” to include regulations that have “substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.” Under the order, agencies may not issue a regulation that has federalism implications, that imposes substantial direct compliance costs, unless the Federal Government provides the funds necessary to pay the direct compliance costs incurred by the State and local governments, or the agencies consult with State and local officials early in the process of developing the proposed regulation. NHTSA has complied with the order’s requirements and consulted directly with the California Air Resources Board in developing a number of elements of this proposal. This proposal would not impose direct compliance costs on State or local governments, because the only entities directly subject to the proposal are vehicle manufacturers.

With regard to the federalism implications of the proposal, NHTSA has spoken to this issue separately at 86 FR 25980 (May 12, 2021), “Corporate Average Fuel Economy (CAFE) Preemption,” notice of proposed rulemaking. Comments on preemption

of State and local laws related to fuel economy standards that are received to *this* NPRM will be deemed late comments to *that* NPRM (the comment period for which has closed) and will be considered as time permits.

#### G. Executive Order 12988 (Civil Justice Reform)

Pursuant to Executive Order 12988, “Civil Justice Reform” (61 FR 4729, Feb. 7, 1996), NHTSA has considered whether this rulemaking would have any retroactive effect. This proposal does not have any retroactive effect.

#### H. Executive Order 13175 (Consultation and Coordination With Indian Tribal Governments)

This proposal does not have tribal implications, as specified in Executive Order 13175 (65 FR 67249, Nov. 9, 2000). This proposal, if finalized, would be implemented at the Federal level and would impose compliance costs only on vehicle manufacturers. Thus, Executive Order 13175, which requires consultation with Tribal officials when agencies are developing policies that have “substantial direct effects” on Tribes and Tribal interests, should not apply to this proposal.

#### I. Unfunded Mandates Reform Act

Section 202 of the Unfunded Mandates Reform Act of 1995 (UMRA) requires Federal agencies to prepare a written assessment of the costs, benefits, and other effects of a proposed or final rule that includes a Federal mandate likely to result in the expenditure by State, local, or Tribal governments, in the aggregate, or by the private sector, of

more than \$100 million in any one year (adjusted for inflation with base year of 1995). Adjusting this amount by the implicit gross domestic product price deflator for 2018 results in \$153 million ( $110.296/71.868 = 1.53$ ).<sup>577</sup> Before promulgating a rule for which a written statement is needed, section 205 of UMRA generally requires NHTSA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objective of the rule. The provisions of section 205 do not apply when they are inconsistent with applicable law. Moreover, section 205 allows NHTSA to adopt an alternative other than the least costly, most cost-effective, or least burdensome alternative if the agency publishes with the rule an explanation of why that alternative was not adopted.

This proposal would not result in the expenditure by State, local, or Tribal governments, in the aggregate, of more than \$153 million annually, but it will result in the expenditure of that magnitude by vehicle manufacturers and/or their suppliers. In developing this proposal, NHTSA considered alternative fuel economy standards both lower and higher than the preferred alternative. NHTSA tentatively concludes that the preferred alternative represents the least costly, most cost-effective, and least burdensome alternative that achieves the objectives of the proposal.

#### J. Regulation Identifier Number

The Department of Transportation assigns a regulation identifier number (RIN) to each regulatory action listed in the Unified Agenda of Federal Regulations. The Regulatory Information Service Center publishes the Unified Agenda in April and October of each year. The RIN contained in the heading at the beginning of this document may be used to find this action in the Unified Agenda.

#### K. National Technology Transfer and Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) requires NHTSA and EPA to evaluate and use existing voluntary consensus standards in its regulatory activities unless doing so would be inconsistent with applicable law (e.g., the statutory provisions regarding

NHTSA's vehicle safety authority) or otherwise impractical.<sup>578</sup>

Voluntary consensus standards are technical standards developed or adopted by voluntary consensus standards bodies. Technical standards are defined by the NTTAA as "performance-based or design-specific technical specification and related management systems practices." They pertain to "products and processes, such as size, strength, or technical performance of a product, process or material."

Examples of organizations generally regarded as voluntary consensus standards bodies include the American Society for Testing and Materials (ASTM), the Society of Automotive Engineers (SAE), and the American National Standards Institute (ANSI). If NHTSA does not use available and potentially applicable voluntary consensus standards, it is required by the Act to provide Congress, through OMB, an explanation of the reasons for not using such standards. There are currently no consensus standards that NHTSA administers relevant to this proposed CAFE standards.

#### L. Department of Energy Review

In accordance with 49 U.S.C. 32902(j)(1), NHTSA submitted this rule to the Department of Energy for review. The Department of Energy concluded that the standard would not adversely affect its conservation goals.

#### M. Paperwork Reduction Act

Under the procedures established by the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501, *et seq.*), Federal agencies must obtain approval from the OMB for each collection of information they conduct, sponsor, or require through regulations. A person is not required to respond to a collection of information by a Federal agency unless the collection displays a valid OMB control number.

NHTSA is seeking OMB's approval for a revision to NHTSA's existing information collection for its reporting requirements under the Corporate Average Fuel Economy (CAFE) program (OMB control number 2127-0019). These reporting requirements are necessary to ensure compliance with its CAFE program. As described in this NPRM, NHTSA is proposing changes to the CAFE program's standardized reporting templates for manufacturers to submit information to NHTSA on their vehicle production and CAFE credits used to comply with the CAFE standards. These changes, if adopted,

will result in additional burden to respondents.

The Information Collection Request (ICR) for a revision of an existing information collection described below has been forwarded to OMB for review and comment. In compliance with the requirements of the PRA, NHTSA asks for public comments on the following proposed collection of information for which the agency is seeking approval from OMB.

*Title:* Corporate Average Fuel Economy.

*OMB Control Number:* 2127-0019.

*Form Numbers:* NHTSA Form 1474 (CAFE Projections Reporting Template), NHTSA Form 1475 (CAFE Credit Template) and NHTSA Form 1621 (CAFE Credit Trade Template).

*Type of Request:* Revision of a currently approved collection.

*Type of Review Requested:* Regular.

*Requested Expiration Date of Approval:* Three years from date of approval.

*Summary of the Collection of Information:* As established by Congress under EPCA, and later amended by EISA, and implemented through NHTSA's regulations for automobile manufacturers complying with CAFE standards prescribed in 49 U.S.C. 32902, many types of reporting provisions exist as a part of the CAFE program. These reporting provisions are necessary for NHTSA to ensure manufacturers comply with CAFE standards and other CAFE requirements. Manufacturers are required to submit information on CAFE standards, exemptions, vehicles, technologies, and submit CAFE compliance test results. Manufacturers also provide information on any of the flexibilities and incentives they use during the model year to comply with CAFE standards.

More specifically, the current collection includes burden hours for small volume manufacturers to request exemptions allowing them to comply with lower alternative CAFE standards to accommodate mainly the sale of exotic sportscars. It also includes hours for manufacturers reporting information on corporate mergers and splits. Other required reporting includes manufacturers submitting information to NHTSA on CAFE credit transactions, plans and other documents associated with the costs of credit trades. In the April 30, 2020, final rule, to help manufacturers better organize credit information, NHTSA also issued a new standardized template for manufacturers to report credit transactions and to prepare credit trade documents. The template could generate the necessary documents that both parties would sign

<sup>577</sup> Bureau of Economic Analysis, National Income and Product Accounts (NIPA), Table 1.1.9 Implicit Price Deflators for Gross Domestic Product. [https://bea.gov/iTable/index\\_nipa.cfm](https://bea.gov/iTable/index_nipa.cfm).

<sup>578</sup> 15 U.S.C. 272.

to facilitate credit trades as well as simplified the organization of other types of credit transactions in addition to correctly performing the necessary mathematical calculations. Finally, the current collection also includes hours for manufacturers to provide pre-model year (PMY) and mid-model year (MMY) CAFE reports to NHTSA and a standardized reporting template adopted in the April 30, 2020, final rule to help manufacturer submit these reports. PMY and MMY reports contain early projections of manufacturers' vehicle and fleet level data demonstrating how they intend to comply with CAFE standards.

As part of this rulemaking, NHTSA is amending its previously approved collection for CAFE-related collections of information. NHTSA is proposing making changes to its reporting template for PMY and MMY reports and adding a new template for reporting the cost of credit trades and is proposing to add the burden hours for these changes to this collection.

Manufacturers identified several changes that were needed to the CAFE reporting template to accommodate different types of vehicles which

NHTSA incorporated along with other functional changes.

Manufacturers have also expressed concern that disclosing trading terms may not be as simple as a spot purchase at a given price. As discussed in the April 30, 2020, final rule, manufacturers contend that a number of transactions for both CAFE and CO<sub>2</sub> credits involve a range of complexity due to numerous factors that are reflective of the marketplace, such as the volume of credits, compliance category, credit expiration date, a seller's compliance strategy, and even the CAFE penalty rate in effect at that time. In addition, manufacturers have a range of partnerships and cooperative agreements with their own competitors. Credit transactions can be an offshoot of these broader relationships, and difficult to price separately and independently. Thus, manufacturers argue that there may not be a reasonable, or even meaningful, presentation of market information in a transaction price. Therefore, NHTSA has developed a new template for capturing the price of credit trades that includes certain monetary and non-monetary terms of credit trading

contracts. NHTSA proposes that manufacturers start using the new template starting September 1, 2022.

*Description of the Need for the Information and the Proposed Use of the Information:* Regulated entities are required to respond to inquiries covered by this collection. 49 U.S.C. 32907. 49 CFR parts 525, 534, 536, and 537.

*Affected Public:* Respondents are manufacturers of engines and vehicles within the North American Industry Classification System (NAICS) and use the coding structure as defined by NAICS including codes 33611, 336111, 336112, 33631, 33631, 33632, 336320, 33635, and 336350 for motor vehicle and parts manufacturing.

*Frequency of response:* Variable, based on compliance obligation. Please see PRA supporting documentation in the docket for more detailed information.

*Average burden time per response:* Variable, based on compliance obligation. Please see PRA supporting documentation in the docket for more detailed information.

*Number of respondents:* 23.

1. Estimated Total Annual Burden Hours and Costs

**Table IX-2 – Estimated Burden for Reporting Requirements**

Applies to:	Manufacturer		Government	
	Hours	Cost	Hours	Cost
Prior Collection	4020.4	\$208,042.23	3,038.00	\$141,246.78
Current Collection	4286.7	\$224,964.52	3,038.00	\$154,490.83
Difference	266.3	\$16,921.98	0	\$13,244.05

*Public Comments Invited:* You are asked to comment on any aspects of this information collection, including (a) whether the proposed collection of information is necessary for the proper performance of the functions of the Department, including whether the information will have practical utility; (b) the accuracy of the Department's estimate of the burden of the proposed information collection; (c) ways to enhance the quality, utility and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of information on respondents, including the use of automated collection techniques or other forms of information technology.

Please submit any comments, identified by the docket number in the heading of this document, by the methods described in the **ADDRESSES** section of this document to NHTSA and

OMB. Although comments may be submitted during the entire comment period, comments received within 30 days of publication are most useful.

*N. Privacy Act*

In accordance with 5 U.S.C. 553(c), NHTSA is soliciting comments from the public to inform the rulemaking process better. These comments will post, without edit, to [www.regulations.gov](http://www.regulations.gov), as described in DOT's systems of records notice, DOT/ALL-14 FDMS, accessible through <https://www.transportation.gov/individuals/privacy/privacy-act-system-records-notices>. In order to facilitate comment tracking and response, NHTSA encourages commenters to provide their names or the names of their organizations; however, submission of names is completely optional.

**List of Subjects in 49 CFR Parts 531, 533, 536, and 537**

Fuel economy, Reporting and recordkeeping requirements.

Regulatory Text

For the reasons discussed in the preamble, the National Highway Traffic Safety Administration proposes to amend 49 CFR chapter V as follows:

- 1. Revise part 531 to read as follows:

**PART 531—PASSENGER AUTOMOBILE AVERAGE FUEL ECONOMY STANDARDS**

- Sec.
- 531.1 Scope.
- 531.2 Purpose.
- 531.3 Applicability.
- 531.4 Definitions.
- 531.5 Fuel economy standards.
- 531.6 Measurement and calculation procedures.

Appendix A to Part 531—Example of Calculating Compliance Under § 531.5(c)

**Authority:** 49 U.S.C. 32902; delegation of authority at 49 CFR 1.95.

**§ 531.1 Scope.**

This part establishes average fuel economy standards pursuant to section 502 (a) and (c) of the Motor Vehicle Information and Cost Savings Act, as amended, for passenger automobiles.

**§ 531.2 Purpose.**

The purpose of this part is to increase the fuel economy of passenger automobiles by establishing minimum

levels of average fuel economy for those vehicles.

**§ 531.3 Applicability.**

This part applies to manufacturers of passenger automobiles.

**§ 531.4 Definitions.**

(a) *Statutory terms.* (1) The terms *average fuel economy*, *manufacture*, *manufacturer*, and *model year* are used as defined in section 501 of the Act.

(2) The terms *automobile* and *passenger automobile* are used as defined in section 501 of the Act and in accordance with the determination in part 523 of this chapter.

(b) *Other terms.* As used in this part, unless otherwise required by the context—

(1) *Act* means the Motor Vehicle Information and Cost Savings Act, as amended by Pub. L. 94–163.

(2) [Reserved]

**§ 531.5 Fuel economy standards.**

(a) Except as provided in paragraph (f) of this section, each manufacturer of passenger automobiles shall comply with the fleet average fuel economy standards in Table 1 to this paragraph (a), expressed in miles per gallon, in the model year specified as applicable:

**Table 1 to Paragraph (a)**

Model year	Average fuel economy standard (miles per gallon)
1978	18.0
1979	19.0
1980	20.0
1981	22.0
1982	24.0
1983	26.0
1984	27.0
1985	27.5
1986	26.0
1987	26.0
1988	26.0
1989	26.5
1990 - 2010	27.5

(b) For model year 2011, a manufacturer’s passenger automobile

fleet shall comply with the fleet average fuel economy level calculated for that

model year according to Figure 1 to this

paragraph (b) and the appropriate values in Table 2 to this paragraph (b).

Figure 1 to Paragraph (b)

$$Required\_Fuel\_Economy\_Level = \frac{N}{\sum_i \frac{N_i}{T_i}}$$

Where:

*N* is the total number (sum) of passenger automobiles produced by a manufacturer;

*N<sub>i</sub>* is the number (sum) of the *i*th passenger automobile model produced by the manufacturer; and  
*T<sub>i</sub>* is the fuel economy target of the *i*th model passenger automobile, which is

determined according to the following formula, rounded to the nearest hundredth:

$$\frac{1}{\frac{1}{a} + \left(\frac{1}{b} - \frac{1}{a}\right) \frac{e^{(x-c)d}}{1 + e^{(x-c)d}}}$$

Where:

Parameters *a*, *b*, *c*, and *d* are defined in Table 2 of this paragraph (b);  
*e* = 2.718; and

*x* = footprint (in square feet, rounded to the nearest tenth) of the vehicle model.

Table 2 to Paragraph (b)-Parameters for the Passenger Automobile Fuel Economy Targets

Model year	Parameters			
	<i>a</i> (mpg)	<i>b</i> (mpg)	<i>c</i> (gal/mi/ft <sup>2</sup> )	<i>d</i> (gal/mi)
2011	31.20	24.00	51.41	1.91

(c) For model years 2012–2026, a manufacturer’s passenger automobile fleet shall comply with the fleet average

fuel economy level calculated for that model year according to Figure 2 to this

paragraph (c) and the appropriate values in Table 3 to this paragraph (c).

Figure 2 to Paragraph (c)

$$CAFE_{required} = \frac{\sum_i PRODUCTION_i}{\sum_i \frac{PRODUCTION_i}{TARGET_i}}$$

Where:

*CAFE<sub>required</sub>* is the fleet average fuel economy standard for a given fleet (domestic passenger automobiles or import passenger automobiles);

Subscript *i* is a designation of multiple groups of automobiles, where each group’s designation, *i.e.*, *i* = 1, 2, 3, etc., represents automobiles that share a unique model type and footprint within

the applicable fleet, either domestic passenger automobiles or import passenger automobiles;  
*Production<sub>i</sub>* is the number of passenger automobiles produced for sale in the United States within each *i*th designation, *i.e.*, which share the same model type and footprint; and  
*TARGET<sub>i</sub>* is the fuel economy target in miles per gallon (mpg) applicable to the

footprint of passenger automobiles within each *i*th designation, *i.e.*, which share the same model type and footprint, calculated according to Figure 3 to this paragraph (c) and rounded to the nearest hundredth of a mpg, *i.e.*, 35.455 = 35.46 mpg, and the summations in the numerator and denominator are both performed over all models in the fleet in question.

Figure 3 to Paragraph (c)

$$TARGET = \frac{1}{MIN \left[ MAX \left( c \times FOOTPRINT + d, \frac{1}{a} \right), \frac{1}{b} \right]}$$

Where:

*TARGET* is the fuel economy target (in mpg) applicable to vehicles of a given footprint (*FOOTPRINT*, in square feet);

Parameters *a*, *b*, *c*, and *d* are defined in Table 3 to this paragraph (c); and

The *MIN* and *MAX* functions take the minimum and maximum, respectively, of the included values.

**Table 3 to Paragraph (c)—Parameters for the Passenger Automobile Fuel Economy Targets,  
MYs 2012-2026**

Model year	Parameters			
	<i>a</i> (mpg)	<i>b</i> (mpg)	<i>c</i> (gal/mi/ft <sup>2</sup> )	<i>d</i> (gal/mi)
2012	35.95	27.95	0.0005308	0.006057
2013	36.80	28.46	0.0005308	0.005410
2014	37.75	29.03	0.0005308	0.004725
2015	39.24	29.90	0.0005308	0.003719
2016	41.09	30.96	0.0005308	0.002573
2017	43.61	32.65	0.0005131	0.001896
2018	45.21	33.84	0.0004954	0.001811
2019	46.87	35.07	0.0004783	0.001729
2020	48.74	36.47	0.0004603	0.001643

**§ 531.6 Measurement and calculation procedures.**

(a) The fleet average fuel economy performance of all passenger automobiles that are manufactured by a manufacturer in a model year shall be determined in accordance with procedures established by the Administrator of the Environmental Protection Agency (EPA) under 49 U.S.C. 32904 and set forth in 40 CFR part 600.

(b) For model years 2017 and later, a manufacturer is eligible to increase the fuel economy performance of passenger cars in accordance with procedures established by the EPA set forth in 40 CFR part 600, subpart F, including any adjustments to fuel economy the EPA allows, such as for fuel consumption improvements related to air conditioning efficiency and off-cycle technologies. Manufacturers must provide reporting on these technologies as specified in 49 CFR 537.7 by the required deadlines.

(1) *Efficient air conditioning technologies.* A manufacturer that seeks to increase its fleet average fuel economy performance through the use of technologies that improve the efficiency of air conditioning systems must follow the requirements in 40 CFR 86.1868–12. Fuel consumption improvement values resulting from the

use of those air conditioning systems must be determined in accordance with 40 CFR 600.510–12(c)(3)(i).

(2) *Off-cycle technologies on EPA’s predefined list or using 5-cycle testing.* A manufacturer that seeks to increase its fleet average fuel economy performance through the use of off-cycle technologies must follow the requirements in 40 CFR 86.1869–12. A manufacturer is eligible to gain fuel consumption improvements for predefined off-cycle technologies in accordance with 40 CFR 86.1869–12(b) or for technologies tested using the EPA’s 5-cycle methodology in accordance with 40 CFR 86.1869–12(c). The fuel consumption improvement is determined in accordance with 40 CFR 600.510–12(c)(3)(ii).

(3) *Off-cycle technologies using the alternative EPA-approved methodology.* A manufacturer is eligible to increase its fuel economy performance through use of an off-cycle technology requiring an application request made to the EPA in accordance with 40 CFR 86.1869–12(d).

(i) *Eligibility under the corporate average fuel economy (CAFE) program requires compliance with paragraphs (b)(3)(i)(A) through (C) of this section.* Paragraphs (b)(3)(i)(A), (B), and (D) of this section apply starting in model year 2024.

(A) A manufacturer seeking to increase its fuel economy performance

using the alternative methodology for an off-cycle technology, if prior to the applicable model year, must submit to EPA a detailed analytical plan and be approved (*i.e.*, for its planned test procedure and model types for demonstration) in accordance with 40 CFR 86.1869–12(d).

(B) A manufacturer seeking to increase its fuel economy performance using the alternative methodology for an off-cycle technology must also submit an official credit application to EPA and obtain approval in accordance with 40 CFR 86.1869–12(e) prior to September of the given model year.

(C) Manufacturer’s plans, applications, and requests approved by the EPA must be made in consultation with the National Highway Traffic Safety Administration (NHTSA). To expedite NHTSA’s consultation with the EPA, a manufacturer must concurrently submit its application to NHTSA if the manufacturer is seeking off-cycle fuel economy improvement values under the CAFE program for those technologies. For off-cycle technologies that are covered under 40 CFR 86.1869–12(d), NHTSA will consult with the EPA regarding NHTSA’s evaluation of the specific off-cycle technology to ensure its impact on fuel economy and the suitability of using the off-cycle

technology to adjust the fuel economy performance.

(D) A manufacturer may request an extension from NHTSA for more time to obtain an EPA approval. Manufacturers should submit their requests 30 days before the deadlines in paragraphs (b)(3)(i)(A) through (C) of this section. Requests should be submitted to NHTSA's Director of the Office of Vehicle Safety Compliance at *cafe@dot.gov*.

(ii) *Review and approval process.* NHTSA will provide its views on the suitability of using the off-cycle technology to adjust the fuel economy performance to the EPA. NHTSA's evaluation and review will consider:

(A) Whether the technology has a direct impact upon improving fuel economy performance;

(B) Whether the technology is related to crash-avoidance technologies, safety critical systems or systems affecting safety-critical functions, or technologies

designed for the purpose of reducing the frequency of vehicle crashes;

(C) Information from any assessments conducted by the EPA related to the application, the technology and/or related technologies; and

(D) Any other relevant factors.

(iii) *Safety.* (A) Technologies found to be defective, or identified as a part of NHTSA's safety defects program, and technologies that are not performing as intended, will have the values of approved off-cycle credits removed from the manufacturer's credit balance or adjusted if the manufacturers can remedy the defective technology. NHTSA will consult with the manufacturer to determine the amount of the adjustment.

(B) Approval granted for innovative and off-cycle technology credits under NHTSA's fuel efficiency program does not affect or relieve the obligation to comply with the Vehicle Safety Act (49 U.S.C. Chapter 301), including the

"make inoperative" prohibition (49 U.S.C. 30122), and all applicable Federal motor vehicle safety standards issued thereunder (FMVSSs) (49 CFR part 571). In order to generate off-cycle or innovative technology credits manufacturers must state—

(1) That each vehicle equipped with the technology for which they are seeking credits will comply with all applicable FMVSS(s); and

(2) Whether or not the technology has a fail-safe provision. If no fail-safe provision exists, the manufacturer must explain why not and whether a failure of the innovative technology would affect the safety of the vehicle.

#### **Appendix A to Part 531—Example of Calculating Compliance Under § 531.5(c)**

Assume a hypothetical manufacturer (Manufacturer X) produces a fleet of domestic passenger automobiles in MY 2012 as follows:

TABLE I TO APPENDIX A

Model type				Description	Actual measured fuel economy (mpg)	Volume
Group	Carline name	Basic engine (L)	Transmission class			
1	PC A FWD	1.8	A5	2-door sedan	34.0	1,500
2	PC A FWD	1.8	M6	2-door sedan	34.6	2,000
3	PC A FWD	2.5	A6	4-door wagon	33.8	2,000
4	PC A AWD	1.8	A6	4-door wagon	34.4	1,000
5	PC A AWD	2.5	M6	2-door hatchback	32.9	3,000
6	PC B RWD	2.5	A6	4-door wagon	32.2	8,000
7	PC B RWD	2.5	A7	4-door sedan	33.1	2,000
8	PC C AWD	3.2	A7	4-door sedan	30.6	5,000
9	PC C FWD	3.2	M6	2-door coupe	28.5	3,000
Total						27,500

Note to this Table I: Manufacturer X's required fleet average fuel economy standard level would first be calculated by determining the fuel economy targets applicable to each unique model type and footprint combination for model type groups 1-9 as illustrated in Table II to this appendix:

Manufacturer X calculates a fuel economy target standard for each unique model type and footprint combination.

TABLE II TO APPENDIX A

Model type				Description	Base tire size	Wheelbase (inches)	Track width F&R average (inches)	Footprint (ft <sup>2</sup> )	Volume	Fuel economy target standard (mpg)
Group	Carline name	Basic engine (L)	Transmission class							
1	PC A FWD	1.8	A5	2-door sedan	205/75 R14	99.8	61.2	42.4	1,500	35.01
2	PC A FWD	1.8	M6	2-door sedan	215/70 R15	99.8	60.9	42.2	2,000	35.14
3	PC A FWD	2.5	A6	4-door wagon	215/70 R15	100.0	60.9	42.3	2,000	35.08
4	PC A AWD	1.8	A6	4-door wagon	235/60 R15	100.0	61.2	42.5	1,000	35.95
5	PC A AWD	2.5	M6	2-door hatchback	225/65 R16	99.6	59.5	41.2	3,000	35.81
6	PC B RWD	2.5	A6	4-door wagon	265/55 R18	109.2	66.8	50.7	8,000	30.33
7	PC B RWD	2.5	A7	4-door sedan	235/65 R17	109.2	67.8	51.4	2,000	29.99
8	PC C AWD	3.2	A7	4-door sedan	265/55 R18	111.3	67.8	52.4	5,000	29.52

9	PC C	3.2	M6	2-door	225/65	111.3	67.2	51.9	3,000	29.76
	FWD			coupe	R16					
Total									27,500	

Note to this Table II: With the appropriate fuel economy targets determined for each unique model type and footprint combination, Manufacturer X's required fleet average fuel economy standard would be calculated as illustrated in Figure 1 to this appendix:

Figure 1 to Appendix A—Calculation of Manufacturer X's Fleet Average Fuel Economy Standard using

Table II to Appendix A

$$\begin{aligned}
 & \text{Fleet Average Fuel Economy Standard} \\
 & = \frac{(\text{Manufacturer's Domestic Passenger Automobile Production for Applicable Model Year})}{\sum_i \left( \frac{\text{Group}_1 \text{ Production}}{\text{Group}_1 \text{ Target Standard}} + \frac{\text{Group}_2 \text{ Production}}{\text{Group}_{12a} \text{ Target Standard}} + \dots + \frac{\text{Group}_9 \text{ Production}}{\text{Group}_9 \text{ Target Standard}} \right)} \\
 & \text{Fleet Average Fuel Economy Standard} \\
 & \quad (27,500) \\
 & = \frac{1500}{35.01} + \frac{2000}{35.14} + \frac{2000}{35.08} + \frac{1000}{35.95} + \frac{3000}{35.81} + \frac{8000}{30.33} + \frac{2000}{29.99} + \frac{5000}{29.52} + \frac{3000}{29.79} = 31.6 \text{ mpg}
 \end{aligned}$$

Figure 2 to Appendix A—Calculation of Manufacturer X's Actual Fleet Average Fuel Economy

Performance Level using Table I to Appendix A

$$\begin{aligned}
 & \text{Fleet Average Fuel Economy Performance} \\
 & = \frac{(\text{Manufacturer's Domestic Passenger Automobile Production for Applicable Model Year})}{\sum_i \left( \frac{\text{Group}_1 \text{ Production}}{\text{Group}_1 \text{ Performance}} + \frac{\text{Group}_2 \text{ Production}}{\text{Group}_2 \text{ Performance}} + \dots + \frac{\text{Group}_9 \text{ Production}}{\text{Group}_9 \text{ Performance}} \right)} \\
 & \text{Fleet Average Fuel Economy Performance} \\
 & \quad (27,500) \\
 & = \frac{1500}{34.0} + \frac{2000}{34.6} + \frac{2000}{33.8} + \frac{1000}{34.4} + \frac{3000}{32.9} + \frac{8000}{32.2} + \frac{2000}{33.1} + \frac{5000}{30.6} + \frac{3000}{28.5} = 32.0 \text{ mpg}
 \end{aligned}$$

Note to Figure 2 to this appendix: Since the actual fleet average fuel economy performance of Manufacturer X's fleet is 32.0 mpg, as compared to its required fleet fuel economy standard of 31.6 mpg, Manufacturer X complied with the CAFE standard for MY 2012 as set forth in §531.5(c).

2. Revise part 533 to read as follows:

**PART 533—LIGHT TRUCK FUEL ECONOMY STANDARDS**

- Sec.
  - 533.1 Scope.
  - 533.2 Purpose.
  - 533.3 Applicability.
  - 533.4 Definitions.
  - 533.5 Requirements.
  - 533.6 Measurement and calculation procedures.
- Appendix A to Part 533—Example of Calculating Compliance Under § 533.5(i)

**Authority:** 49 U.S.C. 32902; delegation of authority at 49 CFR 1.95.

**§ 533.1 Scope.**

This part establishes average fuel economy standards pursuant to section 502(b) of the Motor Vehicle Information and Cost Savings Act, as amended, for light trucks.

**§ 533.2 Purpose.**

The purpose of this part is to increase the fuel economy of light trucks by establishing minimum levels of average fuel economy for those vehicles.

**§ 533.3 Applicability.**

This part applies to manufacturers of light trucks.

**§ 533.4 Definitions.**

(a) *Statutory terms.* (1) The terms *average fuel economy*, *average fuel economy standard*, *fuel economy*, *import*, *manufacture*, *manufacturer*, and *model year* are used as defined in section 501 of the Act.

(2) The term *automobile* is used as defined in section 501 of the Act and in accordance with the determinations in part 523 of this chapter.

(3) The term *domestically manufactured* is used as defined in section 503(b)(2)(E) of the Act.

(b) *Other terms.* As used in this part, unless otherwise required by the context—

(1) *Act* means the Motor Vehicle Information Cost Savings Act, as amended by Public Law 94–163.

(2) *Light truck* is used in accordance with the determinations in part 523 of this chapter.

(3) *Captive import* means with respect to a light truck, one which is not domestically manufactured but which is imported in the 1980 model year or

thereafter by a manufacturer whose principal place of business is in the United States.

(4) *4-wheel drive, general utility vehicle* means a 4-wheel drive, general purpose automobile capable of off-highway operation that has a wheelbase of not more than 280 centimeters, and that has a body shape similar to 1977 Jeep CJ–5 or CJ–7, or the 1977 Toyota Land Cruiser.

(5) *Basic engine* means a unique combination of manufacturer, engine displacement, number of cylinders, fuel system (as distinguished by number of carburetor barrels or use of fuel injection), and catalyst usage.

(6) *Limited product line light truck* means a light truck manufactured by a manufacturer whose light truck fleet is powered exclusively by basic engines which are not also used in passenger automobiles.

**§ 533.5 Requirements.**

(a) Each manufacturer of light trucks shall comply with the following fleet average fuel economy standards, expressed in miles per gallon, in the model year specified as applicable:

**BILLING CODE 4910–59–P**

**Table 1 to Paragraph (a)**

Model year	2-wheel drive light trucks		4-wheel drive light trucks		Limited product line light trucks
	Captive imports	Other	Captive imports	Other	
1979	17.2	15.8			
1980	16.0	16.0	14.0	14.0	14.0
1981	16.7	16.7	15.0	15.0	14.5

Table 2 to Paragraph (a)

Model year	Combined standard		2-wheel drive light trucks		4-wheel drive light trucks

2003	20.7
2004	20.7
2005	21.0
2006	21.6
2007	22.2
2008	22.5
2009	23.1
2010	23.5

Figure 1 to Paragraph (a)

$$Required\_Fuel\_Economy\_Level = \frac{N}{\sum_i \frac{N_i}{T_i}}$$

Where:

*N* is the total number (sum) of light trucks produced by a manufacturer;  
*N<sub>i</sub>* is the number (sum) of the *i*th light truck model type produced by a manufacturer; and  
*T<sub>i</sub>* is the fuel economy target of the *i*th light truck model type, which is determined

according to the following formula, rounded to the nearest hundredth:

$$T = \frac{1}{\frac{1}{a} + \left(\frac{1}{b} - \frac{1}{a}\right) \frac{e^{(x-c)d}}{1 + e^{(x-c)d}}}$$

Where:

Parameters *a*, *b*, *c*, and *d* are defined in Table 5 to this paragraph (a);  
*e* = 2.718; and  
*x* = footprint (in square feet, rounded to the nearest tenth) of the model type.

Table 5 to Paragraph (a)—Parameters for the Light Truck Fuel Economy Targets for MYs

2008-2011

Model year	Parameters			
	<i>a</i> (mpg)	<i>b</i> (mpg)	<i>c</i> (gal/mi/ft <sup>2</sup> )	<i>d</i> (gal/mi)
2008	28.56	19.99	49.30	5.58
2009	30.07	20.87	48.00	5.81
2010	29.96	21.20	48.49	5.50
2011	27.10	21.10	56.41	4.28

Figure 2 to Paragraph (a)

$$CAFE_{required} = \frac{\sum_i PRODUCTION_i}{\sum_i \frac{PRODUCTION_i}{TARGET_i}}$$

Where:

*CAFE<sub>required</sub>* is the fleet average fuel economy standard for a given light truck fleet;  
 Subscript *i* is a designation of multiple groups of light trucks, where each

group's designation, *i.e.*, *i* = 1, 2, 3, etc., represents light trucks that share a unique model type and footprint within the applicable fleet;

*Production<sub>i</sub>* is the number of light trucks produced for sale in the United States within each *i*th designation, *i.e.*, which share the same model type and footprint; and

*TARGET<sub>i</sub>* is the fuel economy target in miles per gallon (mpg) applicable to the

footprint of light trucks within each *i*th designation, *i.e.*, which share the same model type and footprint, calculated according to either Figure 3 or Figure 4 to this paragraph (a), as appropriate, and rounded to the nearest hundredth of a mpg, *i.e.*, 35.455 = 35.46 mpg, and the summations in the numerator and denominator are both performed over all models in the fleet in question.

Figure 3 to Paragraph (a)

$$TARGET = \frac{1}{\text{MIN} \left[ \text{MAX} \left( c \times FOOTPRINT + d, \frac{1}{a} \right), \frac{1}{b} \right]}$$

Where:

*TARGET* is the fuel economy target (in mpg) applicable to vehicles of a given footprint (*FOOTPRINT*, in square feet);

Parameters *a*, *b*, *c*, and *d* are defined in Table 6 to this paragraph (a); and

The *MIN* and *MAX* functions take the minimum and maximum, respectively, of the included values.

**Table 6 to Paragraph (a)—Parameters for the Light Truck Fuel Economy Targets for MYs 2012-2016**

Model year	Parameters			
	<i>a</i> (mpg)	<i>b</i> (mpg)	<i>c</i> (gal/mi/ft <sup>2</sup> )	<i>d</i> (gal/mi)
2012	29.82	22.27	0.0004546	0.014900
2013	30.67	22.74	0.0004546	0.013968
2014	31.38	23.13	0.0004546	0.013225
2015	32.72	23.85	0.0004546	0.011920
2016	34.42	24.74	0.0004546	0.010413

Figure 4 to Paragraph (a)

*TARGET*

$$= \text{MAX} \left( \frac{1}{\text{MIN} \left[ \text{MAX} \left( c \times \text{FOOTPRINT} + d, \frac{1}{a} \right), \frac{1}{b} \right]}, \frac{1}{\text{MIN} \left[ \text{MAX} \left( g \times \text{FOOTPRINT} + h \frac{1}{e} \right), \frac{1}{f} \right]} \right)$$

Where:

*TARGET* is the fuel economy target (in mpg) applicable to vehicles of a given footprint (*FOOTPRINT*, in square feet);

Parameters *a*, *b*, *c*, *d*, *e*, *f*, *g*, and *h* are defined in Table 7 to this paragraph (a); and

The *MIN* and *MAX* functions take the minimum and maximum, respectively, of the included values.

(b)(1) For model year 1979, each manufacturer may:

(i) Combine its 2- and 4-wheel drive light trucks and comply with the average fuel economy standard in paragraph (a) of this section for 2-wheel drive light trucks; or

(ii) Comply separately with the two standards specified in paragraph (a) of this section.

(2) For model year 1979, the standard specified in paragraph (a) of this section for 4-wheel drive light trucks applies only to 4-wheel drive general utility vehicles. All other 4-wheel drive light trucks in that model year shall be included in the 2-wheel drive category for compliance purposes.

(c) For model years 1980 and 1981, manufacturers of limited product line light trucks may:

(1) Comply with the separate standard for limited product line light trucks; or

(2) Comply with the other standards specified in paragraph (a) of this section, as applicable.

(d) For model years 1982–91, each manufacturer may:

(1) Combine its 2- and 4-wheel drive light trucks (segregating captive import and other light trucks) and comply with the combined average fuel economy standard specified in paragraph (a) of this section; or

(2) Comply separately with the 2-wheel drive standards and the 4-wheel drive standards (segregating captive

import and other light trucks) specified in paragraph (a) of this section.

(e) For model year 1992, each manufacturer shall comply with the average fuel economy standard specified in paragraph (a) of this section (segregating captive import and other light trucks).

(f) For each model year 1996 and thereafter, each manufacturer shall combine its captive imports with its other light trucks and comply with the fleet average fuel economy standard in paragraph (a) of this section.

(g) For model years 2008–2010, at a manufacturer’s option, a manufacturer’s light truck fleet may comply with the fuel economy standard calculated for each model year according to Figure 1 to paragraph (a) of this section and the

appropriate values in Table 5 to paragraph (a) of this section, with said option being irrevocably chosen for that model year and reported as specified in § 537.8 of this chapter.

(h) For model year 2011, a manufacturer's light truck fleet shall comply with the fleet average fuel economy standard calculated for that model year according to Figure 1 to paragraph (a) of this section and the appropriate values in Table 5 to paragraph (a) of this section.

(i) For model years 2012–2016, a manufacturer's light truck fleet shall comply with the fleet average fuel economy standard calculated for that model year according to Figures 2 and 3 to paragraph (a) of this section and the appropriate values in Table 6 to paragraph (a) of this section.

(j) For model years 2017–2025, a manufacturer's light truck fleet shall comply with the fleet average fuel economy standard calculated for that model year according to Figures 2 and 4 to paragraph (a) of this section and the appropriate values in Table 7 to paragraph (a) of this section.

#### **§ 533.6 Measurement and calculation procedures.**

(a) Any reference to a class of light trucks manufactured by a manufacturer shall be deemed—

(1) To include all light trucks in that class manufactured by persons who control, are controlled by, or are under common control with, such manufacturer; and

(2) To include only light trucks which qualify as non-passenger vehicles in accordance with 49 CFR 523.5 based upon the production measurements of the vehicles as sold to dealerships; and

(3) To exclude all light trucks in that class manufactured (within the meaning of paragraph (a)(1) of this section) during a model year by such manufacturer which are exported prior to the expiration of 30 days following the end of such model year.

(b) The fleet average fuel economy performance of all light trucks that are manufactured by a manufacturer in a model year shall be determined in accordance with procedures established by the Administrator of the Environmental Protection Agency (EPA) under 49 U.S.C. 32904 and set forth in 40 CFR part 600.

(c) For model years 2017 and later, a manufacturer is eligible to increase the fuel economy performance of light trucks in accordance with procedures established by the EPA set forth in 40 CFR part 600, subpart F, including any adjustments to fuel economy the EPA allows, such as for fuel consumption

improvements related to air conditioning efficiency, off-cycle technologies, and hybridization and other performance-based technologies for full-size pickup trucks that meet the requirements specified in 40 CFR 86.1803. Manufacturers must provide reporting on these technologies as specified in 49 CFR 537.7 by the required deadlines.

(1) *Efficient air conditioning technologies.* A manufacturer that seeks to increase its fleet average fuel economy performance through the use of technologies that improve the efficiency of air conditioning systems must follow the requirements in 40 CFR 86.1868–12. Fuel consumption improvement values resulting from the use of those air conditioning systems must be determined in accordance with 40 CFR 600.510–12(c)(3)(i).

(2) *Incentives for advanced full-size light-duty pickup trucks.* The eligibility of a manufacturer to increase its fuel economy using hybridized and other performance-based technologies for full-size pickup trucks must follow 40 CFR 86.1870–12 and the fuel consumption improvement of these full-size pickup truck technologies must be determined in accordance with 40 CFR 600.510–12(c)(3)(iii). Manufacturers may also combine incentives for full size pickups and dedicated alternative fueled vehicles when calculating fuel economy performance values in 40 CFR 600.510–12.

(3) *Off-cycle technologies on EPA's predefined list or using 5-cycle testing.* A manufacturer that seeks to increase its fleet average fuel economy performance through the use of off-cycle technologies must follow the requirements in 40 CFR 86.1869–12. A manufacturer is eligible to gain fuel consumption improvements for predefined off-cycle technologies in accordance with 40 CFR 86.1869–12(b) or for technologies tested using the EPA's 5-cycle methodology in accordance with 40 CFR 86.1869–12(c). The fuel consumption improvement is determined in accordance with 40 CFR 600.510–12(c)(3)(ii).

(4) *Off-cycle technologies using the alternative EPA-approved methodology.* A manufacturer is eligible to increase its fuel economy performance through use of an off-cycle technology requiring an application request made to the EPA in accordance with 40 CFR 86.1869–12(d).

(i) *Eligibility under the corporate average fuel economy (CAFE) program requires compliance with paragraphs (c)(4)(i)(A) through (C) of this section.* Paragraphs (c)(4)(i)(A) through (C) of this section apply starting in model year 2024.

(A) A manufacturer seeking to increase its fuel economy performance using the alternative methodology for an off-cycle technology, if prior to the applicable model year, must submit to EPA a detailed analytical plan and be approved (*i.e.*, for its planned test procedure and model types for demonstration) in accordance with 40 CFR 86.1869–12(d).

(B) A manufacturer seeking to increase its fuel economy performance using the alternative methodology for an off-cycle technology must also submit an official credit application to EPA and obtain approval in accordance with 40 CFR 86.1869–12(e) prior to September of the given model year.

(C) Manufacturer's plans, applications and requests approved by the EPA must be made in consultation with the National Highway Traffic Safety Administration (NHTSA). To expedite NHTSA's consultation with the EPA, a manufacturer must concurrently submit its application to NHTSA if the manufacturer is seeking off-cycle fuel economy improvement values under the CAFE program for those technologies. For off-cycle technologies that are covered under 40 CFR 86.1869–12(d), NHTSA will consult with the EPA regarding NHTSA's evaluation of the specific off-cycle technology to ensure its impact on fuel economy and the suitability of using the off-cycle technology to adjust the fuel economy performance.

(ii) *Review and approval process.* NHTSA will provide its views on the suitability of using the off-cycle technology to adjust the fuel economy performance to the EPA. NHTSA's evaluation and review will consider:

(A) Whether the technology has a direct impact upon improving fuel economy performance;

(B) Whether the technology is related to crash-avoidance technologies, safety critical systems or systems affecting safety-critical functions, or technologies designed for the purpose of reducing the frequency of vehicle crashes;

(C) Information from any assessments conducted by the EPA related to the application, the technology and/or related technologies; and

(D) Any other relevant factors.

(E) NHTSA will collaborate to host annual meetings with EPA at least once by July 30th before the model year begins to provide general guidance to the industry on past off-cycle approvals.

(iii) *Safety.* (A) Technologies found to be defective, or identified as a part of NHTSA's safety defects program, and technologies that are not performing as intended, will have the values of approved off-cycle credits removed from

the manufacturer’s credit balance or adjusted if the manufacturers can remedy the defective technology. NHTSA will consult with the manufacturer to determine the amount of the adjustment.

(B) Approval granted for innovative and off-cycle technology credits under NHTSA’s fuel efficiency program does not affect or relieve the obligation to comply with the Vehicle Safety Act (49 U.S.C. Chapter 301), including the

“make inoperative” prohibition (49 U.S.C. 30122), and all applicable Federal motor vehicle safety standards issued thereunder (FMVSSs) (49 CFR part 571). In order to generate off-cycle or innovative technology credits manufacturers must state—

(1) That each vehicle equipped with the technology for which they are seeking credits will comply with all applicable FMVSS(s); and

(2) Whether or not the technology has a fail-safe provision. If no fail-safe

provision exists, the manufacturer must explain why not and whether a failure of the innovative technology would affect the safety of the vehicle.

**Appendix A to Part 533—Example of Calculating Compliance Under § 533.5(i)**

Assume a hypothetical manufacturer (Manufacturer X) produces a fleet of light trucks in MY 2012 as follows:

**BILLING CODE 4910-59-P**

**TABLE I TO APPENDIX A**

Model type				Description	Actual measured fuel economy (mpg)	Volume
Group	Carline name	Basic engine (L)	Transmission class			
1	Pickup A 2WD	4	A5	Reg cab, MB	27.1	800
2	Pickup B 2WD	4	M5	Reg cab, MB	27.6	200
3	Pickup C 2WD	4.5	A5	Reg cab, LB	23.9	300

4	Pickup C 2WD	4	M5	Ext cab, MB	23.7	400
5	Pickup C 4WD	4.5	A5	Crew cab, SB	23.5	400
6	Pickup D 2WD	4.5	A6	Crew cab, SB	23.6	400
7	Pickup E 2WD	5	A6	Ext cab, LB	22.7	500
8	Pickup E 2WD	5	A6	Crew cab, MB	22.5	500
9	Pickup F 2WD	4.5	A5	Reg cab, LB	22.5	1,600
10	Pickup F 4WD	4.5	A5	Ext cab, MB	22.3	800
11	Pickup F 4WD	4.5	A5	Crew cab, SB	22.2	800
Total	6,700					

**Note to this Table I:** Manufacturer X's required fleet average fuel economy standard level would first be calculated by determining the fuel economy targets applicable to each unique model type and footprint combination for model type groups 1-11 as illustrated in Table II to this appendix.

Manufacturer X calculates a fuel economy target standard for each unique model type and footprint combination.

TABLE II TO APPENDIX A

Model type				Description	Base tire size	Wheelbase (inches)	Track width F&R average (inches)	Footprint (ft <sup>2</sup> )	Volume	Fuel economy target standard (mpg)
Group	Carline name	Basic engine (L)	Transmission class							
1	Pickup A 2WD	4	A5	Reg cab, MB	235/75R1 5	100.0	68.8	47.8	800	27.30
2	Pickup B 2WD	4	M5	Reg cab, MB	235/75R1 5	100.0	68.2	47.4	200	27.44
3	Pickup C 2WD	4.5	A5	Reg cab, LB	255/70R1 7	125.0	68.8	59.7	300	23.79
4	Pickup C 2WD	4	M5	Ext cab, MB	255/70R1 7	125.0	68.8	59.7	400	23.79
5	Pickup C 4WD	4.5	A5	Crew cab, SB	275/70R1 7	150.0	69.0	71.9	400	22.27
6	Pickup D 2WD	4.5	A6	Crew cab, SB	255/70R1 7	125.0	68.8	59.7	400	23.79
7	Pickup E 2WD	5	A6	Ext cab, LB	255/70R1 7	125.0	68.8	59.7	500	23.79
8	Pickup E 2WD	5	A6	Crew cab, MB	285/70R1 7	125.0	69.2	60.1	500	23.68
9	Pickup F 2WD	4.5	A5	Reg cab, LB	255/70R1 7	125.0	68.9	59.8	1,600	23.76

10	Pickup F 4WD	4.5	A5	Ext cab, MB	275/70R1 7	150.0	69.0	71.9	800	22.27
11	Pickup F 4WD	4.5	A5	Crew cab, SB	285/70R1 7	150.0	69.2	72.1	800	22.27
Total									6,700	

**Note to this Table II:** With the appropriate fuel economy targets determined for each unique model type and footprint combination, Manufacturer X's required fleet average fuel economy standard would be calculated as illustrated in Figure 1 to this appendix:

Figure 1 to Appendix A--Calculation of Manufacturer X's Fleet Average Fuel Economy Standard using Table II of Appendix A

$$\begin{aligned}
 & \text{Fleet Average Fuel Economy Standard} \\
 & \text{(Manufacturer's light truck Production for Applicable Model Year)} \\
 & = \frac{\sum_i \left( \frac{\text{Group}_1 \text{ Production}}{\text{Group}_1 \text{ Target Standard}} + \frac{\text{Group}_2 \text{ Production}}{\text{Group}_2 \text{ Target Standard}} + \dots + \frac{\text{Group}_{11} \text{ Production}}{\text{Group}_{11} \text{ Target Standard}} \right)}{\text{Fleet Average Fuel Economy Standard}} \\
 & \quad (6,700) \\
 & = \frac{800}{27.30} + \frac{200}{27.44} + \frac{300}{23.79} + \frac{400}{23.79} + \frac{400}{22.27} + \frac{400}{23.79} + \frac{500}{23.79} + \frac{500}{23.68} + \frac{1600}{23.76} + \frac{800}{22.27} + \frac{800}{22.27} \\
 & \quad = 23.7 \text{ mpg}
 \end{aligned}$$

FIGURE 2 TO APPENDIX A—CALCULATION OF MANUFACTURER X'S ACTUAL FLEET AVERAGE FUEL ECONOMY PERFORMANCE LEVEL USING TABLE I OF APPENDIX A

$$\begin{aligned}
 & \text{Fleet Average Fuel Economy Performance} \\
 & \text{(Manufacturer's Light Truck Production for Applicable Model Year)} \\
 & = \frac{\sum_i \left( \frac{\text{Group}_1 \text{ Production}}{\text{Group}_1 \text{ Performance}} + \frac{\text{Group}_2 \text{ Production}}{\text{Group}_2 \text{ Performance}} + \dots + \frac{\text{Group}_{11} \text{ Production}}{\text{Group}_{11} \text{ Performance}} \right)}{\text{Fleet Average Fuel Economy Performance}} \\
 & \quad (6,700) \\
 & = \frac{800}{27.1} + \frac{200}{27.6} + \frac{300}{23.9} + \frac{400}{23.7} + \frac{400}{23.5} + \frac{400}{23.6} + \frac{500}{22.7} + \frac{500}{22.5} + \frac{1600}{22.5} + \frac{800}{22.3} + \frac{800}{22.2} = 23.3 \text{ mpg}
 \end{aligned}$$

NOTE TO FIGURE 2 TO THIS APPENDIX: Since the actual fleet average fuel economy performance of Manufacturer X's fleet is 23.3 mpg, as compared to its required fleet fuel economy standard of 23.7 mpg, Manufacturer X did not comply with the CAFE standard for MY 2012 as set forth in §533.5(i).

## BILLING CODE 4910-59-C

■ 3. Revise part 536 to read as follows:

**PART 536—TRANSFER AND TRADING OF FUEL ECONOMY CREDITS**

Sec.

- 536.1 Scope.
- 536.2 Application.
- 536.3 Definitions.
- 536.4 Credits.
- 536.5 Trading infrastructure.
- 536.6 Treatment of credits earned prior to model year 2011.
- 536.7 Treatment of carryback credits.
- 536.8 Conditions for trading of credits.
- 536.9 Use of credits with regard to the domestically manufactured passenger automobile minimum standard.
- 536.10 Treatment of dual-fuel and alternative fuel vehicles—consistency with 49 CFR part 538.

**Authority:** 49 U.S.C. 32903; delegation of authority at 49 CFR 1.95.

**§ 536.1 Scope.**

This part establishes regulations governing the use and application of corporate average fuel economy (CAFE) credits up to three model years before and five model years after the model year in which the credit was earned. It also specifies requirements for manufacturers wishing to transfer fuel economy credits between their fleets and for manufacturers and other persons wishing to trade fuel economy credits to achieve compliance with prescribed fuel economy standards.

**§ 536.2 Application.**

This part applies to all credits earned (and transferable and tradable) for exceeding applicable average fuel economy standards in a given model year for domestically manufactured passenger cars, imported passenger cars, and light trucks.

**§ 536.3 Definitions.**

(a) *Statutory terms.* All terms defined in 49 U.S.C. 32901(a) are used pursuant to their statutory meaning.

(b) *Other terms.* As used in the part:  
*Above standard fuel economy* means, with respect to a compliance category, that the automobiles manufactured by a manufacturer in that compliance category in a particular model year have greater average fuel economy (calculated in a manner that reflects the incentives for alternative fuel automobiles per 49 U.S.C. 32905) than that manufacturer's fuel economy standard for that compliance category and model year.

*Adjustment factor* means a factor used to adjust the value of a traded or transferred credit for compliance purposes to ensure that the compliance value of the credit when used reflects the total volume of oil saved when the credit was earned.

*Below standard fuel economy* means, with respect to a compliance category, that the automobiles manufactured by a manufacturer in that compliance category in a particular model year have lower average fuel economy (calculated in a manner that reflects the incentives for alternative fuel automobiles per 49 U.S.C. 32905) than that manufacturer's fuel economy standard for that compliance category and model year.

*Compliance* means a manufacturer achieves compliance in a particular compliance category when:

(1)(i) The average fuel economy of the vehicles in that category exceed or meet the fuel economy standard for that category; or

(ii) The average fuel economy of the vehicles in that category do not meet the fuel economy standard for that category, but the manufacturer proffers a sufficient number of valid credits, adjusted for total oil savings, to cover the gap between the average fuel economy of the vehicles in that category and the required average fuel economy.

(2) A manufacturer achieves compliance for its fleet if the conditions in paragraph (1)(i) or (ii) of this definition are simultaneously met for all compliance categories.

*Compliance category* means any of three categories of automobiles subject to Federal fuel economy regulations. The three compliance categories recognized by 49 U.S.C. 32903(g)(6) are domestically manufactured passenger automobiles, imported passenger automobiles, and non-passenger automobiles ("light trucks").

*Credit holder (or holder)* means a legal person that has valid possession of credits, either because they are a manufacturer who has earned credits by exceeding an applicable fuel economy standard, or because they are a designated recipient who has received credits from another holder. Credit holders need not be manufacturers, although all manufacturers may be credit holders.

*Credits (or fuel economy credits)* means an earned or purchased allowance recognizing that the average fuel economy of a particular manufacturer's vehicles within a particular compliance category and model year exceeds that manufacturer's fuel economy standard for that compliance category and model year. One credit is equal to  $\frac{1}{10}$  of a mile per gallon above the fuel economy standard per one vehicle within a compliance category. Credits are denominated according to model year in which they are earned (vintage), originating manufacturer, and compliance category.

*Expiry date* means the model year after which fuel economy credits may no longer be used to achieve compliance with fuel economy regulations. Expiry dates are calculated in terms of model years: For example, if a manufacturer earns credits for model year 2011, these credits may be used for compliance in model years 2008–2016.

*Fleet* means all automobiles that are manufactured by a manufacturer in a particular model year and are subject to fuel economy standards under 49 CFR parts 531 and 533. For the purposes of this part, a manufacturer's fleet means all domestically manufactured and imported passenger automobiles and non-passenger automobiles ("light trucks"). "Work trucks" and medium and heavy trucks are not included in this definition for purposes of this part.

*Light truck* means the same as "non-passenger automobile," as that term is defined in 49 U.S.C. 32901(a)(17), and as "light truck," as that term is defined at 49 CFR 523.5.

*Originating manufacturer* means the manufacturer that originally earned a particular credit. Each credit earned will be identified with the name of the originating manufacturer.

*Trade* means the receipt by the National Highway Traffic Safety Administration (NHTSA) of an instruction from a credit holder to place one of its credits in the account of another credit holder. A credit that has been traded can be identified because the originating manufacturer will be a different party than the current credit holder. Traded credits are moved from one credit holder to the recipient credit holder within the same compliance category for which the credits were originally earned. If a credit has been traded to another credit holder and is subsequently traded back to the originating manufacturer, it will be deemed not to have been traded for compliance purposes.

*Transfer* means the application by a manufacturer of credits earned by that manufacturer in one compliance category or credits acquired be trade (and originally earned by another manufacturer in that category) to achieve compliance with fuel economy standards with respect to a different compliance category. For example, a manufacturer may purchase light truck credits from another manufacturer, and transfer them to achieve compliance in the manufacturer's domestically manufactured passenger car fleet. Subject to the credit transfer limitations of 49 U.S.C. 32903(g)(3), credits can also be transferred across compliance categories and banked or saved in that category to be carried forward or

backwards later to address a credit shortfall.

*Vintage* means, with respect to a credit, the model year in which the credit was earned.

**§ 536.4 Credits.**

(a) *Type and vintage.* All credits are identified and distinguished in the accounts by originating manufacturer, compliance category, and model year of origin (vintage).

(b) *Application of credits.* All credits earned and applied are calculated, per 49 U.S.C. 32903(c), in tenths of a mile per gallon by which the average fuel economy of vehicles in a particular compliance category manufactured by a manufacturer in the model year in which the credits are earned exceeds the applicable average fuel economy standard, multiplied by the number of

vehicles sold in that compliance category. However, credits that have been traded between credit holders or transferred between compliance categories are valued for compliance purposes using the adjustment factor specified in paragraph (c) of this section, pursuant to the “total oil savings” requirement of 49 U.S.C. 32903(f)(1).

(c) *Adjustment factor.* When traded or transferred and used, fuel economy credits are adjusted to ensure fuel oil savings is preserved. For traded credits, the user (or buyer) must multiply the calculated adjustment factor by the number of shortfall credits it plans to offset in order to determine the number of equivalent credits to acquire from the earner (or seller). For transferred credits, the user of credits must multiply the calculated adjustment factor by the

number of shortfall credits it plans to offset in order to determine the number of equivalent credits to transfer from the compliance category holding the available credits. The adjustment factor is calculated according to the following formula:

$$A = \left( \frac{VMT_u * MPG_{ae} * MPG_{se}}{VMT_e * MPG_{au} * MPG_{su}} \right)$$

Where:

A = Adjustment factor applied to traded and transferred credits. The quotient shall be rounded to 4 decimal places.

VMT<sub>e</sub> = Lifetime vehicle miles traveled as provided in the following table for the model year and compliance category in which the credit was earned.

VMT<sub>u</sub> = Lifetime vehicle miles traveled as provided in the following table for the model year and compliance category in which the credit is used for compliance.

**Table 1 to Paragraph (c)**

Model year	Lifetime Vehicle Miles Traveled (VMT)					
	2012	2013	2014	2015	2016	2017-2025
Passenger Cars	177,238	177,366	178,652	180,497	182,134	195,264
Light Trucks	208,471	208,537	209,974	212,040	213,954	225,865

MPG<sub>se</sub> = Required fuel economy standard for the originating (earning) manufacturer, compliance category, and model year in which the credit was earned.

MPG<sub>ae</sub> = Actual fuel economy for the originating manufacturer, compliance category, and model year in which the credit was earned.

MPG<sub>su</sub> = Required fuel economy standard for the user (buying) manufacturer, compliance category, and model year in which the credit is used for compliance.

MPG<sub>au</sub> = Actual fuel economy for the user manufacturer, compliance category, and model year in which the credit is used for compliance.

**§ 536.5 Trading infrastructure.**

(a) *Accounts.* NHTSA maintains “accounts” for each credit holder. The account consists of a balance of credits in each compliance category and vintage held by the holder.

(b) *Who may hold credits.* Every manufacturer subject to fuel economy standards under 49 CFR part 531 or 533 is automatically an account holder. If the manufacturer earns credits pursuant to this part, or receives credits from

another party, so that the manufacturer’s account has a non-zero balance, then the manufacturer is also a credit holder. Any party designated as a recipient of credits by a current credit holder will receive an account from NHTSA and become a credit holder, subject to the following conditions:

(1) A designated recipient must provide name, address, contacting information, and a valid taxpayer identification number or Social Security number;

(2) NHTSA does not grant a request to open a new account by any party other than a party designated as a recipient of credits by a credit holder; and

(3) NHTSA maintains accounts with zero balances for a period of time, but reserves the right to close accounts that have had zero balances for more than one year.

(c) *Automatic debits and credits of accounts.* (1) To carry credits forward, backward, transfer credits, or trade credits into other credit accounts, a manufacturer or credit holder must

submit a credit instruction to NHTSA. A credit instruction must detail and include:

(i) The credit holder(s) involved in the transaction.

(ii) The originating credits described by the amount of the credits, compliance category and the vintage of the credits.

(iii) The recipient credit account(s) for banking or applying the originating credits described by the compliance category(ies), model year(s), and if applicable the adjusted credit amount(s) and adjustment factor(s).

(iv) For trades, a contract authorizing the trade signed by the manufacturers or credit holders or by managers legally authorized to obligate the sale and purchase of the traded credits.

(2) Upon receipt of a credit instruction from an existing credit holder, NHTSA verifies the presence of sufficient credits in the account(s) of the credit holder(s) involved as applicable and notifies the credit holder(s) that the credits will be debited from and/or

credited to the accounts involved, as specified in the credit instruction. NHTSA determines if the credits can be debited or credited based upon the amount of available credits, accurate application of any adjustment factors and the credit requirements prescribed by this part that are applicable at the time the transaction is requested.

(3) After notifying the credit holder(s), all accounts involved are either credited or debited, as appropriate, in line with the credit instruction. Traded credits identified by a specific compliance category are deposited into the recipient's account in that same compliance category and model year. If a recipient of credits as identified in a credit instruction is not a current account holder, NHTSA establishes the credit recipient's account, subject to the conditions described in paragraph (b) of this section, and adds the credits to the newly-opened account.

(4) NHTSA will automatically delete unused credits from holders' accounts when those credits reach their expiry date.

(5) Starting January 1, 2022, manufacturers or credit holders issuing credit instructions or providing credit allocation plans as specified in paragraph (d) of this section, must use and submit the NHTSA Credit Template fillable form (Office of Management and Budget (OMB) Control No. 2127-0019, NHTSA Form 1475). The NHTSA Credit Template is available for download on NHTSA's website. If a credit instruction includes a trade, the NHTSA Credit Template must be signed by managers legally authorized to obligate the sale and/or purchase of the traded credits from both parties to the trade. The NHTSA Credit Template signed by both parties to the trade serves as an acknowledgement that the parties have agreed to trade credits, and does not dictate terms, conditions, or other business obligations of the parties. Manufacturers must submit the template along with other requested information through the CAFE email, *cafe@dot.gov*. NHTSA reserves the right to request additional information from the parties regarding the terms of the trade.

(6) Starting September 1, 2022, manufacturers or credit holders trading credits must use and submit the NHTSA Credit Value Reporting Template fillable form (OMB Control No. 2127-0019, NHTSA Form 1621). The NHTSA Credit Template is available for download on NHTSA's website. The template will provide NHTSA with the price paid for the credits including a description of any other monetary or non-monetary terms affecting the price of the traded credits, such as any technology

exchanged or shared for the credits, any other non-monetary payment for the credits, or any other agreements related to the trade. Manufacturers must submit the template along with other requested information through the CAFE email, *cafe@dot.gov*. NHTSA reserves the right to request additional information from the parties regarding the terms of the trade.

(7) NHTSA will consider claims that information submitted to the agency under this section is entitled to confidential treatment under 5 U.S.C. 552(b) and under the provisions of part 512 of this chapter if the information is submitted in accordance with the procedures of part 512.

(d) *Compliance.* (1) NHTSA assesses compliance with fuel economy standards each year, utilizing the certified and reported CAFE data provided by the Environmental Protection Agency (EPA) for enforcement of the CAFE program pursuant to 49 U.S.C. 32904(e). Credit values are calculated based on the CAFE data from the EPA. If a particular compliance category within a manufacturer's fleet has above standard fuel economy, NHTSA adds credits to the manufacturer's account for that compliance category and vintage in the appropriate amount by which the manufacturer has exceeded the applicable standard.

(2) If a manufacturer's vehicles in a particular compliance category have below standard fuel economy, NHTSA will provide written notification to the manufacturer that it has failed to meet a particular fleet target standard. The manufacturer will be required to confirm the shortfall and must either: Submit a plan indicating how it will allocate existing credits or earn, transfer and/or acquire credits; or pay the appropriate civil penalty. The manufacturer must submit a plan or payment within 60 days of receiving agency notification.

(3) Credits used to offset shortfalls are subject to the three- and five-year limitations as described in § 536.6.

(4) Transferred credits are subject to the limitations specified by 49 U.S.C. 32903(g)(3) and this part.

(5) The value, when used for compliance, of any credits received via trade or transfer is adjusted, using the adjustment factor described in § 536.4(c), pursuant to 49 U.S.C. 32903(f)(1).

(6) Credit allocation plans received from a manufacturer will be reviewed and approved by NHTSA. Starting in model year 2022, use the NHTSA Credit Template and the Credit Trade Cost Template (OMB Control No. 2127-0019,

NHTSA Forms 1475 and 1621) to record the credit transactions and the costs for any credit trades requested in the credit allocation plan. The template is a fillable form that has an option for recording and calculating credit transactions for credit allocation plans. The template calculates the required adjustments to the credits. The credit allocation plan and the completed transaction templates must be submitted to NHTSA. NHTSA will approve the credit allocation plan unless it finds that the proposed credits are unavailable or that it is unlikely that the plan will result in the manufacturer earning sufficient credits to offset the subject credit shortfall. If the plan is approved, NHTSA will revise the respective manufacturer's credit account accordingly. If the plan is rejected, NHTSA will notify the respective manufacturer and request a revised plan or payment of the appropriate fine.

(e) *Reporting.* (1) NHTSA periodically publishes the names and credit holdings of all credit holders. NHTSA does not publish individual transactions, nor respond to individual requests for updated balances from any party other than the account holder.

(2) NHTSA issues an annual credit status letter to each party that is a credit holder at that time. The letter to a credit holder includes a credit accounting record that identifies the credit status of the credit holder including any activity (earned, expired, transferred, traded, carry-forward and carry-back credit transactions/allocation) that took place during the identified activity period.

#### **§ 536.6 Treatment of credits earned prior to model year 2011.**

(a) Credits earned in a compliance category before model year 2008 may be applied by the manufacturer that earned them to carryback plans for that compliance category approved up to three model years prior to the year in which the credits were earned, or may be applied to compliance in that compliance category for up to three model years after the year in which the credits were earned.

(b) Credits earned in a compliance category during and after model year 2008 may be applied by the manufacturer that earned them to carryback plans for that compliance category approved up to three years prior to the year in which the credits were earned, or may be held or applied for up to five model years after the year in which the credits were earned.

(c) Credits earned in a compliance category prior to model year 2011 may not be transferred or traded.

**§ 536.7 Treatment of carryback credits.**

(a) Carryback credits earned in a compliance category in any model year may be used in carryback plans approved by NHTSA, pursuant to 49 U.S.C. 32903(b), for up to three model years prior to the year in which the credit was earned.

(b) For purposes of this part, NHTSA will treat the use of future credits for compliance, as through a carryback plan, as a deferral of penalties for non-compliance with an applicable fuel economy standard.

(c) If NHTSA receives and approves a manufacturer's carryback plan to earn future credits within the following three model years in order to comply with current regulatory obligations, NHTSA will defer levying fines for non-compliance until the date(s) when the manufacturer's approved plan indicates that credits will be earned or acquired to achieve compliance, and upon receiving confirmed CAFE data from EPA. If the manufacturer fails to acquire or earn sufficient credits by the plan dates, NHTSA will initiate compliance proceedings.

(d) In the event that NHTSA fails to receive or approve a plan for a non-compliant manufacturer, NHTSA will levy fines pursuant to statute. If within three years, the non-compliant manufacturer earns or acquires additional credits to reduce or eliminate the non-compliance, NHTSA will reduce any fines owed, or repay fines to the extent that credits received reduce the non-compliance.

(e) No credits from any source (earned, transferred and/or traded) will be accepted in lieu of compliance if those credits are not identified as originating within one of the three model years after the model year of the confirmed shortfall.

**§ 536.8 Conditions for trading of credits.**

(a) *Trading of credits.* If a credit holder wishes to trade credits to another party, the current credit holder and the receiving party must jointly issue an instruction to NHTSA, identifying the quantity, vintage, compliance category, and originator of the credits to be traded. If the recipient is not a current account holder, the recipient must provide sufficient information for NHTSA to establish an account for the recipient. Once an account has been established or identified for the recipient, NHTSA completes the trade by debiting the transferor's account and crediting the recipient's account. NHTSA will track the quantity, vintage, compliance category, and originator of all credits held or traded by all account-holders.

(b) *Trading between and within compliance categories.* For credits earned in model year 2011 or thereafter, and used to satisfy compliance obligations for model year 2011 or thereafter:

(1) Manufacturers may use credits originally earned by another manufacturer in a particular compliance category to satisfy compliance obligations within the same compliance category.

(2) Once a manufacturer acquires by trade credits originally earned by another manufacturer in a particular compliance category, the manufacturer may transfer the credits to satisfy its compliance obligations in a different compliance category, but only to the extent that the CAFE increase attributable to the transferred credits does not exceed the limits in 49 U.S.C. 32903(g)(3). For any compliance category, the sum of a manufacturer's transferred credits earned by that manufacturer and transferred credits obtained by that manufacturer through trade must not exceed that limit.

(c) *Changes in corporate ownership and control.* Manufacturers must inform NHTSA of corporate relationship changes to ensure that credit accounts are identified correctly and credits are assigned and allocated properly.

(1) In general, if two manufacturers merge in any way, they must inform NHTSA how they plan to merge their credit accounts. NHTSA will subsequently assess corporate fuel economy and compliance status of the merged fleet instead of the original separate fleets.

(2) If a manufacturer divides or divests itself of a portion of its automobile manufacturing business, it must inform NHTSA how it plans to divide the manufacturer's credit holdings into two or more accounts. NHTSA will subsequently distribute holdings as directed by the manufacturer, subject to provision for reasonably anticipated compliance obligations.

(3) If a manufacturer is a successor to another manufacturer's business, it must inform NHTSA how it plans to allocate credits and resolve liabilities per 49 CFR part 534.

(d) *No short or forward sales.* NHTSA will not honor any instructions to trade or transfer more credits than are currently held in any account. NHTSA will not honor instructions to trade or transfer credits from any future vintage (*i.e.*, credits not yet earned). NHTSA will not participate in or facilitate contingent trades.

(e) *Cancellation of credits.* A credit holder may instruct NHTSA to cancel

its currently held credits, specifying the originating manufacturer, vintage, and compliance category of the credits to be cancelled. These credits will be permanently null and void; NHTSA will remove the specific credits from the credit holder's account, and will not reissue them to any other party.

(f) *Errors or fraud in earning credits.* If NHTSA determines that a manufacturer has been credited, through error or fraud, with earning credits, NHTSA will cancel those credits if possible. If the manufacturer credited with having earned those credits has already traded them when the error or fraud is discovered, NHTSA will hold the receiving manufacturer responsible for returning the same or equivalent credits to NHTSA for cancellation.

(g) *Error or fraud in trading.* In general, all trades are final and irrevocable once executed, and may only be reversed by a new, mutually-agreed transaction. If NHTSA executes an erroneous instruction to trade credits from one holder to another through error or fraud, NHTSA will reverse the transaction if possible. If those credits have been traded away, the recipient holder is responsible for obtaining the same or equivalent credits for return to the previous holder.

**§ 536.9 Use of credits with regard to the domestically manufactured passenger automobile minimum standard.**

(a) Each manufacturer is responsible for compliance with both the minimum standard and the attribute-based standard.

(b) In any particular model year, the domestically manufactured passenger automobile compliance category credit excess or shortfall is determined by comparing the actual CAFE value against either the required standard value or the minimum standard value, whichever is larger.

(c) Transferred or traded credits may not be used, pursuant to 49 U.S.C. 32903(g)(4) and (f)(2), to meet the domestically manufactured passenger automobile minimum standard specified in 49 U.S.C. 32902(b)(4) and in 49 CFR 531.5(d).

(d) If a manufacturer's average fuel economy level for domestically manufactured passenger automobiles is lower than the attribute-based standard, but higher than the minimum standard, then the manufacturer may achieve compliance with the attribute-based standard by applying credits.

(e) If a manufacturer's average fuel economy level for domestically manufactured passenger automobiles is lower than the minimum standard, then the difference between the minimum

standard and the manufacturer's actual fuel economy level may only be relieved by the use of credits earned by that manufacturer within the domestic passenger car compliance category which have not been transferred or traded. If the manufacturer does not have available earned credits to offset a credit shortage below the minimum standard then the manufacturer can submit a carry-back plan that indicates sufficient future credits will be earned in its domestic passenger car compliance category or will be subject to penalties.

**§ 536.10 Treatment of dual-fuel and alternative fuel vehicles—consistency with 49 CFR part 538.**

(a) Statutory alternative fuel and dual-fuel vehicle fuel economy calculations are treated as a change in the underlying fuel economy of the vehicle for purposes of this part, not as a credit that may be transferred or traded. Improvements in alternative fuel or dual fuel vehicle fuel economy as calculated pursuant to 49 U.S.C. 32905 and limited by 49 U.S.C. 32906 are therefore attributable only to the particular compliance category and model year to which the alternative or dual-fuel vehicle belongs.

(b) If a manufacturer's calculated fuel economy for a particular compliance category, including any statutorily-required calculations for alternative fuel and dual fuel vehicles, is higher or lower than the applicable fuel economy standard, manufacturers will earn credits or must apply credits or pay civil penalties equal to the difference between the calculated fuel economy level in that compliance category and the applicable standard. Credits earned are the same as any other credits, and may be held, transferred, or traded by the manufacturer subject to the limitations of the statute and this part.

(c) For model years (MYs) up to and including MY 2019, if a manufacturer builds enough dual fuel vehicles (except plug-in hybrid electric vehicles) to improve the calculated fuel economy in a particular compliance category by more than the limits set forth in 49 U.S.C. 32906(a), the improvement in fuel economy for compliance purposes is restricted to the statutory limit. Manufacturers may not earn credits nor reduce the application of credits or fines for calculated improvements in fuel economy based on dual fuel vehicles beyond the statutory limit.

(d) For model years 2020 and beyond, a manufacturer must calculate the fuel economy of dual fueled vehicles in accordance with 40 CFR 600.510–12(c).

■ 4. Revise part 537 to read as follows:

**PART 537—AUTOMOTIVE FUEL ECONOMY REPORTS**

Sec.

- 537.1 Scope.
- 537.2 Purpose.
- 537.3 Applicability.
- 537.4 Definitions.
- 537.5 General requirements for reports.
- 537.6 General content of reports.
- 537.7 Pre-model year and mid-model year reports.
- 537.8 Supplementary reports.
- 537.9 Determination of fuel economy values and average fuel economy.
- 537.10 Incorporating documents into reports.
- 537.11 Public inspection of information.
- 537.12 Confidential information.

**Authority:** 49 U.S.C. 32907, delegation of authority at 49 CFR 1.95.

**§ 537.1 Scope.**

This part establishes requirements for automobile manufacturers to submit reports to the National Highway Traffic Safety Administration (NHTSA) regarding their efforts to improve automotive fuel economy.

**§ 537.2 Purpose.**

The purpose of this part is to obtain information to aid the National Highway Traffic Safety Administration in valuating automobile manufacturers' plans for complying with average fuel economy standards and in preparing an annual review of the average fuel economy standards.

**§ 537.3 Applicability.**

This part applies to automobile manufacturers, except for manufacturers subject to an alternate fuel economy standard under section 502(c) of the Act.

**§ 537.4 Definitions.**

(a) *Statutory terms.* (1) The terms *average fuel economy standard*, *fuel*, *manufacture*, and *model year* are used as defined in section 501 of the Act.

(2) The term *manufacturer* is used as defined in section 501 of the Act and in accordance with part 529 of this chapter.

(3) The terms *average fuel economy*, *fuel economy*, and *model type* are used as defined in subpart A of 40 CFR part 600.

(4) The terms *automobile*, *automobile capable of off-highway operation*, and *passenger automobile* are used as defined in section 501 of the Act and in accordance with the determinations in part 523 of this chapter.

(b) *Other terms.* (1) The term *loaded vehicle weight* is used as defined in subpart A of 40 CFR part 86.

(2) The terms *axle ratio*, *base level*, *body style*, *car line*, *combined fuel*

*economy*, *engine code*, *equivalent test weight*, *gross vehicle weight*, *inertia weight*, *transmission class*, and *vehicle configuration* are used as defined in subpart A of 40 CFR part 600.

(3) The term *light truck* is used as defined in part 523 of this chapter and in accordance with determinations in part 523.

(4) The terms *approach angle*, *axle clearance*, *brakeover angle*, *cargo carrying volume*, *departure angle*, *passenger carrying volume*, *running clearance*, and *temporary living quarters* are used as defined in part 523 of this chapter.

(5) The term *incomplete automobile manufacturer* is used as defined in part 529 of this chapter.

(6) As used in this part, unless otherwise required by the context:

(i) *Act* means the Motor Vehicle Information and Cost Savings Act (Pub. L. 92–513), as amended by the Energy Policy and Conservation Act (Pub. L. 94–163).

(ii) *Administrator* means the Administrator of the National Highway Traffic Safety Administration or the Administrator's delegate.

(iii) *Current model year* means:

(A) In the case of a pre-model year report, the full model year immediately following the period during which that report is required by § 537.5(b) to be submitted.

(B) In the case of a mid-model year report, the model year during which that report is required by § 537.5(b) to be submitted.

(iv) *Average* means a production-weighted harmonic average.

(v) *Total drive ratio* means the ratio of an automobile's engine rotational speed (in revolutions per minute) to the automobile's forward speed (in miles per hour).

**§ 537.5 General requirements for reports.**

(a) For each current model year, each manufacturer shall submit a pre-model year report, a mid-model year report, and, as required by § 537.8, supplementary reports.

(b)(1) The pre-model year report required by this part for each current model year must be submitted during the month of December (e.g., the pre-model year report for the 1983 model year must be submitted during December, 1982).

(2) The mid-model year report required by this part for each current model year must be submitted during the month of July (e.g., the mid-model year report for the 1983 model year must be submitted during July 1983).

(3) Each supplementary report must be submitted in accordance with § 537.8(c).

(c) Each report required by this part must:

(1) Identify the report as a pre-model year report, mid-model year report, or supplementary report as appropriate;

(2) Identify the manufacturer submitting the report;

(3) State the full name, title, and address of the official responsible for preparing the report;

(4) Be submitted on CD-ROM for confidential reports provided in accordance with § 537.12 and by email for non-confidential (*i.e.*, redacted) versions of reports. The content of reports must be provided in a PDF or MS Word format except for the information required in § 537.7 which must be provided in a MS Excel format. Submit 2 copies of the CD-ROM to: Administrator, National Highway Traffic Administration, 1200 New Jersey Avenue SW, Washington, DC 20590, and submit reports electronically to the following secure email address: [cafe@dot.gov](mailto:cafe@dot.gov);

(5) Identify the current model year;

(6) Be written in the English language; and

(7)(i) Specify any part of the information or data in the report that the manufacturer believes should be withheld from public disclosure as trade secret or other confidential business information.

(ii) With respect to each item of information or data requested by the manufacturer to be withheld under 5 U.S.C. 552(b)(4) and 15 U.S.C. 2005(d)(1), the manufacturer shall:

(A) Show that the item is within the scope of sections 552(b)(4) and 2005(d)(1);

(B) Show that disclosure of the item would result in significant competitive damage;

(C) Specify the period during which the item must be withheld to avoid that damage; and

(D) Show that earlier disclosure would result in that damage.

(d) Beginning with model year 2023, each manufacturer shall generate reports required by this part using the NHTSA CAFE Projections Reporting Template (Office of Management and Budget (OMB) Control No. 2127-0019, NHTSA Form 1474). The template is a fillable form.

(1) *Report type selection.* Select the option to identify the report as a pre-model year report, mid-model year report, or supplementary report as appropriate.

(2) *Required information.* Complete all required information for the manufacturer and for all vehicles produced for the current model year required to comply with corporate

average fuel economy (CAFE) standards. Identify the manufacturer submitting the report, including the full name, title, and address of the official responsible for preparing the report and a point of contact to answer questions concerning the report.

(3) *Report generation.* Use the template to generate confidential and non-confidential reports for all the domestic and import passenger cars and light truck fleet produced by the manufacturer for the current model year. Manufacturers must submit a request for confidentiality in accordance with part 512 of this chapter to withhold projected production sales volume estimates from public disclosure. If the request is granted, NHTSA will withhold the projected production sales volume estimates from public disclosure until all the vehicles produced by the manufacturer have been made available for sale (usually one year after the current model year).

(4) *Report submission.* Submit confidential reports and requests for confidentiality to NHTSA on CD-ROM in accordance with § 537.12. Email copies of non-confidential (*i.e.*, redacted) reports to NHTSA's secure email address: [cafe@dot.gov](mailto:cafe@dot.gov). Requests for confidentiality must be submitted in a PDF or MS Word format. Submit 2 copies of the CD-ROM to: Administrator, National Highway Traffic Administration, 1200 New Jersey Avenue SE, Washington, DC 20590, and submit emailed reports electronically to the following secure email address: [cafe@dot.gov](mailto:cafe@dot.gov).

(5) *Confidentiality requests.* Manufacturers can withhold information on projected production sales volumes under 5 U.S.C. 552(b)(4) and 15 U.S.C. 2005(d)(1). In accordance, the manufacturer must:

(i) Show that the item is within the scope of sections 552(b)(4) and 2005(d)(1);

(ii) Show that disclosure of the item would result in significant competitive damage;

(iii) Specify the period during which the item must be withheld to avoid that damage; and

(iv) Show that earlier disclosure would result in that damage.

(e) Each report required by this part must be based upon all information and data available to the manufacturer 30 days before the report is submitted to the Administrator.

#### § 537.6 General content of reports.

(a) *Pre-model year and mid-model year reports.* Except as provided in paragraph (c) of this section, each pre-model year report and the mid-model

year report for each model year must contain the information required by § 537.7(a).

(b) *Supplementary report.* Except as provided in paragraph (c) of this section, each supplementary report for each model year must contain the information required by § 537.7(a)(1) and (2), as appropriate for the vehicle fleets produced by the manufacturer, in accordance with § 537.8(b)(1), (2), (3), and (4) as appropriate.

(c) *Exceptions.* The pre-model year report, mid-model year report, and supplementary report(s) submitted by an incomplete automobile manufacturer for any model year are not required to contain the information specified in § 537.7(c)(4)(xv) through (xviii) and (c)(5). The information provided by the incomplete automobile manufacturer under § 537.7(c) shall be according to base level instead of model type or carline.

#### § 537.7 Pre-model year and mid-model year reports.

(a) *Report content.* (1) Provide a report with the information required by paragraphs (b) and (c) of this section for each domestic and import passenger automobile fleet, as specified in part 531 of this chapter, for the current model year.

(2) Provide a report with the information required by paragraphs (b) and (c) of this section for each light truck fleet, as specified in part 533 of this chapter, for the current model year.

(3) For model year 2023 and later, for passenger cars specified in part 531 of this chapter and light trucks specified in part 533 of this chapter, provide the information for pre-model and mid-model year reports in accordance with the NHTSA CAFE Projections Reporting Template (OMB Control No. 2127-0019, NHTSA Form 1474). The required reporting template can be downloaded from NHTSA's website.

(b) *Projected average and required fuel economy.* (1) State the projected average fuel economy for the manufacturer's automobiles determined in accordance with § 537.9 and based upon the fuel economy values and projected sales figures provided under paragraph (c)(2) of this section.

(2) State the projected final average fuel economy that the manufacturer anticipates having if changes implemented during the model year will cause that average to be different from the average fuel economy projected under paragraph (b)(1) of this section.

(3) State the projected required fuel economy for the manufacturer's passenger automobiles and light trucks determined in accordance with

§§ 531.5(c) and 533.5 of this chapter and based upon the projected sales figures provided under paragraph (c)(2) of this section. For each unique model type and footprint combination of the manufacturer's automobiles, provide the information specified in paragraphs (b)(3)(i) and (ii) of this section in tabular form. List the model types in order of increasing average inertia weight from top to bottom down the left side of the table and list the information categories in the order specified in paragraphs (b)(3)(i) and (ii) of this section from left to right across the top of the table. Other formats, such as those accepted by the EPA, which contain all the information in a readily identifiable format are also acceptable. For model year 2023 and later, for each unique model type and footprint combination of the manufacturer's automobiles, provide the information specified in paragraphs (b)(3)(i) and (ii) of this section in accordance with the CAFE Projections Reporting Template (OMB Control No. 2127-0019, NHTSA Form 1474).

(i) In the case of passenger automobiles:

(A) Beginning model year 2013, base tire as defined in § 523.2 of this chapter;

(B) Beginning model year 2013, front axle, rear axle, and average track width as defined in § 523.2 of this chapter;

(C) Beginning model year 2013, wheelbase as defined in § 523.2 of this chapter; and

(D) Beginning model year 2013, footprint as defined in § 523.2 of this chapter.

(E) The fuel economy target value for each unique model type and footprint entry listed in accordance with the equation provided in part 531 of this chapter.

(ii) In the case of light trucks:

(A) Beginning model year 2013, base tire as defined in § 523.2 of this chapter;

(B) Beginning model year 2013, front axle, rear axle, and average track width as defined in § 523.2 of this chapter;

(C) Beginning model year 2013, wheelbase as defined in § 523.2 of this chapter; and

(D) Beginning model year 2013, footprint as defined in § 523.2 of this chapter.

(E) The fuel economy target value for each unique model type and footprint entry listed in accordance with the equation provided in part 533 of this chapter.

(4) State the projected final required fuel economy that the manufacturer anticipates having if changes implemented during the model year will cause the targets to be different from the target fuel economy projected under paragraph (b)(3) of this section.

(5) State whether the manufacturer believes that the projections it provides under paragraphs (b)(2) and (4) of this section, or if it does not provide an average or target under paragraphs (b)(2) and (4), the projections it provides under paragraphs (b)(1) and (3) of this section, sufficiently represent the manufacturer's average and target fuel economy for the current model year for purposes of the Act. In the case of a manufacturer that believes that the projections are not sufficiently representative for the purposes of the preceding sentence, state the specific nature of any reason for the insufficiency and the specific additional testing or derivation of fuel economy values by analytical methods believed by the manufacturer necessary to eliminate the insufficiency and any plans of the manufacturer to undertake that testing or derivation voluntarily and submit the resulting data to the Environmental Protection Agency under 40 CFR 600.509.

(c) *Model type and configuration fuel economy and technical information.* (1) For each model type of the manufacturer's automobiles, provide the information specified in paragraph (c)(2) of this section in tabular form. List the model types in order of increasing average inertia weight from top to bottom down the left side of the table and list the information categories in the order specified in paragraph (c)(2) of this section from left to right across the top of the table. For model year 2023 and later, CAFE reports required by this part, shall for each model type of the manufacturer's automobiles, provide the information in specified in paragraph (c)(2) of this section in accordance with the NHTSA CAFE Projections Reporting Template (OMB Control No. 2127-0019, NHTSA Form 1474) and list the model types in order of increasing average inertia weight from top to bottom.

(2)(i) Combined fuel economy; and  
(ii) Projected sales for the current model year and total sales of all model types.

(3) For pre-model year reports only through model year 2022, for each vehicle configuration whose fuel economy was used to calculate the fuel economy values for a model type under paragraph (c)(2) of this section, provide the information specified in paragraph (c)(4) of this section in accordance with the NHTSA CAFE Projections Reporting Template (OMB Control No. 2127-0019, NHTSA Form 1474).

(4)(i) Loaded vehicle weight;  
(ii) Equivalent test weight;  
(iii) Engine displacement, liters;  
(iv) SAE net rated power, kilowatts;  
(v) SAE net horsepower;

(vi) Engine code;  
(vii) Fuel system (number of carburetor barrels or, if fuel injection is used, so indicate);

(viii) Emission control system;  
(ix) Transmission class;  
(x) Number of forward speeds;  
(xi) Existence of overdrive (indicate yes or no);

(xii) Total drive ratio (N/V);  
(xiii) Axle ratio;  
(xiv) Combined fuel economy;  
(xv) Projected sales for the current model year;

(xvi)(A) In the case of passenger automobiles:

(1) Interior volume index, determined in accordance with subpart D of 40 CFR part 600; and

(2) Body style;

(B) In the case of light trucks:

(1) Passenger-carrying volume; and

(2) Cargo-carrying volume;

(xvii) Frontal area;

(xviii) Road load power at 50 miles per hour, if determined by the manufacturer for purposes other than compliance with this part to differ from the road load setting prescribed in 40 CFR 86.177-11(d); and

(xix) Optional equipment that the manufacturer is required under 40 CFR parts 86 and 600 to have actually installed on the vehicle configuration, or the weight of which must be included in the curb weight computation for the vehicle configuration, for fuel economy testing purposes.

(5) For each model type of automobile which is classified as a non-passenger vehicle (light truck) under part 523 of this chapter, provide the following data:

(i) For an automobile designed to perform at least one of the following functions in accordance with § 523.5(a) of this chapter indicate (by "yes" or "no" for each function) whether the vehicle can:

(A) Transport more than 10 persons (if yes, provide actual designated seating positions);

(B) Provide temporary living quarters (if yes, provide applicable conveniences as defined in § 523.2 of this chapter);

(C) Transport property on an open bed (if yes, provide bed size width and length);

(D) Provide, as sold to the first retail purchaser, greater cargo-carrying than passenger-carrying volume, such as in a cargo van and quantify the value which should be the difference between the values provided in paragraphs (c)(4)(xvi)(B)(1) and (2) of this section; if a vehicle is sold with a second-row seat, its cargo-carrying volume is determined with that seat installed, regardless of whether the manufacturer has described that seat as optional; or

(E) Permit expanded use of the automobile for cargo-carrying purposes or other non-passenger-carrying purposes through:

(1) For non-passenger automobiles manufactured prior to model year 2012, the removal of seats to permit expanded use of the automobile for cargo-carrying purposes or other non-passenger-carrying purposes through means provided by the automobile's manufacturer or with simple tools, such as screwdrivers and wrenches, so as to create a flat, floor level, surface extending from the forward-most point of installation of those seats to the rear of the automobile's interior; or

(2) For non-passenger automobiles manufactured in model year 2008 and beyond, for vehicles equipped with at least 3 rows of designated seating positions as standard equipment, permit expanded use of the automobile for cargo-carrying purposes or other nonpassenger-carrying purposes through the removal or stowing of foldable or pivoting seats so as to create a flat, leveled cargo surface extending from the forward-most point of installation of those seats to the rear of the automobile's interior.

(ii) For an automobile capable of off-highway operation, identify which of the features below qualify the vehicle as off-road in accordance with § 523.5(b) of this chapter and quantify the values of each feature:

(A) 4-wheel drive; or

(B) A rating of more than 6,000 pounds gross vehicle weight; and

(C) Has at least four of the following characteristics calculated when the automobile is at curb weight, on a level surface, with the front wheels parallel to the automobile's longitudinal centerline, and the tires inflated to the manufacturer's recommended pressure. The exact value of each feature should be quantified:

(1) Approach angle of not less than 28 degrees.

(2) Breakover angle of not less than 14 degrees.

(3) Departure angle of not less than 20 degrees.

(4) Running clearance of not less than 20 centimeters.

(5) Front and rear axle clearances of not less than 18 centimeters each.

(6) The fuel economy values provided under paragraphs (c)(2) and (4) of this section shall be determined in accordance with § 537.9.

(7) Identify any air-conditioning (AC), off-cycle, and full-size pick-up truck technologies used each model year to calculate the average fuel economy specified in 40 CFR 600.510–12.

(i) Provide a list of each air conditioning efficiency improvement technology utilized in your fleet(s) of vehicles for each model year. For each technology identify vehicles by make and model types that have the technology, which compliance category those vehicles belong to and the number of vehicles for each model equipped with the technology. For each compliance category (domestic passenger car, import passenger car, and light truck), report the air conditioning fuel consumption improvement value in gallons/mile in accordance with the equation specified in 40 CFR 600.510–12(c)(3)(i).

(ii) Provide a list of off-cycle efficiency improvement technologies utilized in your fleet(s) of vehicles for each model year that is pending or approved by the EPA. For each technology identify vehicles by make and model types that have the technology, which compliance category those vehicles belong to, the number of vehicles for each model equipped with the technology, and the associated off-cycle credits (grams/mile) available for each technology. For each compliance category (domestic passenger car, import passenger car, and light truck), calculate the fleet off-cycle fuel consumption improvement value in gallons/mile in accordance with the equation specified in 40 CFR 600.510–12(c)(3)(ii).

(iii) Provide a list of full-size pickup trucks in your fleet that meet the mild and strong hybrid vehicle definitions as specified in 40 CFR 86.1803–01. For each mild and strong hybrid type, identify vehicles by make and model types that have the technology, the number of vehicles produced for each model equipped with the technology, the total number of full-size pickup trucks produced with and without the technology, the calculated percentage of hybrid vehicles relative to the total number of vehicles produced, and the associated full-size pickup truck credits (grams/mile) available for each technology. For the light truck compliance category, calculate the fleet pickup truck fuel consumption improvement value in gallons/mile in accordance with the equation specified in 40 CFR 600.510–12(c)(3)(iii).

#### § 537.8 Supplementary reports.

(a)(1) Except as provided in paragraph (d) of this section, each manufacturer whose most recently submitted semiannual report contained an average fuel economy projection under § 537.7(b)(2) or, if no average fuel economy was projected under that section, under § 537.7(b)(1), that was not

less than the applicable average fuel economy standard and who now projects an average fuel economy which is less than the applicable standard shall file a supplementary report containing the information specified in paragraph (b)(1) of this section.

(2) Except as provided in paragraph (d) of this section, each manufacturer that determines that its average fuel economy for the current model year as projected under § 537.7(b)(2) or, if no average fuel economy was projected under § 537.7(b)(2), as projected under § 537.7(b)(1), is less representative than the manufacturer previously reported it to be under § 537.7(b)(3), this section, or both, shall file a supplementary report containing the information specified in paragraph (b)(2) of this section.

(3) For model years through 2022, each manufacturer whose pre-model or mid-model year report omits any of the information specified in § 537.7(b) or (c) shall file a supplementary report containing the information specified in paragraph (b)(3) of this section.

(4) Starting model year 2023, each manufacturer whose pre-model or mid-model year report omits any of the information shall resubmit the information with other information required in accordance with the NHTSA CAFE Projections Reporting Template (OMB Control No. 2127–0019, NHTSA Form 1474).

(b)(1) The supplementary report required by paragraph (a)(1) of this section must contain:

(i) Such revisions of and additions to the information previously submitted by the manufacturer under this part regarding the automobiles whose projected average fuel economy has decreased as specified in paragraph (a)(1) of this section as are necessary—

(A) To reflect the decrease and its cause; and

(B) To indicate a new projected average fuel economy based upon these additional measures.

(ii) An explanation of the cause of the decrease in average fuel economy that led to the manufacturer's having to submit the supplementary report required by paragraph (a)(1) of this section.

(2) The supplementary report required by paragraph (a)(2) of this section must contain:

(i) A statement of the specific nature of and reason for the insufficiency in the representativeness of the projected average fuel economy;

(ii) A statement of specific additional testing or derivation of fuel economy values by analytical methods believed by the manufacturer necessary to eliminate the insufficiency; and

(iii) A description of any plans of the manufacturer to undertake that testing or derivation voluntarily and submit the resulting data to the Environmental Protection Agency under 40 CFR 600.509.

(3) The supplementary report required by paragraph (a)(3) of this section must contain:

(i) All of the information omitted from the pre-model year report under § 537.6(c)(2); and

(ii) Such revisions of and additions to the information submitted by the manufacturer in its pre-model year report regarding the automobiles produced during the current model year as are necessary to reflect the information provided under paragraph (b)(3)(i) of this section.

(4) The supplementary report required by paragraph (a)(4) of this section must contain:

(i) All information omitted from the pre-model or mid-model year reports under § 537.6(c)(2); and

(ii) Such revisions of and additions to the information submitted by the manufacturer in its pre-model or mid-model year reports regarding the automobiles produced during the current model year as are necessary to reflect the information provided under paragraph (b)(4)(i) of this section.

(c)(1) Each report required by paragraph (a)(1), (2), (3), or (4) of this section must be submitted in accordance with § 537.5(c) not more than 45 days after the date on which the manufacturer determined, or could have determined with reasonable diligence, that the report was required.

(2) [Reserved]

(d) A supplementary report is not required to be submitted by the manufacturer under paragraph (a)(1) or (2) of this section:

(1) With respect to information submitted under this part before the most recent semiannual report submitted by the manufacturer under this part; or

(2) When the date specified in paragraph (c) of this section occurs:

(i) During the 60-day period immediately preceding the day by which the mid-model year report for the current model year must be submitted by the manufacturer under this part; or

(ii) After the day by which the pre-model year report for the model year

immediately following the current model year must be submitted by the manufacturer under this part.

(e) For model years 2008, 2009, and 2010, each manufacturer of light trucks, as that term is defined in 49 CFR 523.5, shall submit a report, not later than 45 days following the end of the model year, indicating whether the manufacturer is opting to comply with 49 CFR 533.5(f) or (g).

#### **§ 537.9 Determination of fuel economy values and average fuel economy.**

(a) *Vehicle subconfiguration fuel economy values.* (1) For each vehicle subconfiguration for which a fuel economy value is required under paragraph (c) of this section and has been determined and approved under 40 CFR part 600, the manufacturer shall submit that fuel economy value.

(2) For each vehicle subconfiguration specified in paragraph (a)(1) of this section for which a fuel economy value approved under 40 CFR part 600, does not exist, but for which a fuel economy value determined under 40 CFR part 600 exists, the manufacturer shall submit that fuel economy value.

(3) For each vehicle subconfiguration specified in paragraph (a)(1) of this section for which a fuel economy value has been neither determined nor approved under 40 CFR part 600, the manufacturer shall submit a fuel economy value based on tests or analyses comparable to those prescribed or permitted under 40 CFR part 600 and a description of the test procedures or analytical methods used.

(4) For each vehicle configuration for which a fuel economy value is required under paragraph (c) of this section and has been determined and approved under 40 CFR part 600, the manufacturer shall submit that fuel economy value.

(b) *Base level and model type fuel economy values.* For each base level and model type, the manufacturer shall submit a fuel economy value based on the values submitted under paragraph (a) of this section and calculated in the same manner as base level and model type fuel economy values are calculated for use under subpart F of 40 CFR part 600.

(c) *Average fuel economy.* Average fuel economy must be based upon fuel economy values calculated under

paragraph (b) of this section for each model type and must be calculated in accordance with subpart F of 40 CFR part 600, except that fuel economy values for running changes and for new base levels are required only for those changes made or base levels added before the average fuel economy is required to be submitted under this part.

#### **§ 537.10 Incorporating documents into reports.**

(a) A manufacturer may incorporate by reference in a report required by this part any document other than a report, petition, or application, or portion thereof submitted to any Federal department or agency more than two model years before the current model year.

(b) A manufacturer that incorporates by references a document not previously submitted to the National Highway Traffic Safety Administration shall append that document to the report.

(c) A manufacturer that incorporates by reference a document shall clearly identify the document and, in the case of a document previously submitted to the National Highway Traffic Safety Administration, indicate the date on which and the person by whom the document was submitted to this agency.

#### **§ 537.11 Public inspection of information.**

Except as provided in § 537.12, any person may inspect the information and data submitted by a manufacturer under this part in the docket section of the National Highway Traffic Safety Administration. Any person may obtain copies of the information available for inspection under this section in accordance with the regulations of the Secretary of Transportation in part 7 of this title.

#### **§ 537.12 Confidential information.**

(a) *Granting confidential treatment.* Information made available under § 537.11 for public inspection does not include information for which confidentiality is requested under § 537.5(c)(7), is granted in accordance with section 505 of the Act and section 552(b) of Title 5 of the United States Code and is not subsequently released under paragraph (c) of this section in accordance with section 505 of the Act.

(b) *Denial of confidential treatment.* When the Administrator denies a manufacturer's request under § 537.5(c)(7) for confidential treatment of information, the Administrator gives the manufacturer written notice of the denial and reasons for it. Public disclosure of the information is not made until after the ten-day period

immediately following the giving of the notice.

(c) *Release of confidential information.* After giving written notice to a manufacturer and allowing ten days, when feasible, for the manufacturer to respond, the Administrator may make available for public inspection any information submitted under this part that is relevant to a proceeding under the Act,

including information that was granted confidential treatment by the Administrator pursuant to a request by the manufacturer under § 537.5(c)(7).

Issued on August 5, 2021, in Washington, DC, under authority delegated in 49 CFR 1.95

**Steven S. Cliff,**

*Acting Administrator.*

## EPA Announces the “Clean Trucks Plan”

**H**eavy-duty trucks and buses continue to contribute significantly to air pollution at the local, regional, and national level, often disproportionately affecting communities of color and low-income populations.

To ensure the progress needed on cleaning trucks and buses and to harness improvements in vehicle technologies, EPA will issue two major regulations over the next three years—the “Clean Trucks Plan” that will result in decreasing emissions from new heavy-duty vehicles, including long-haul tractors, buses, commercial delivery trucks, and many other types of trucks. These new rules will be major steps towards improving air quality and addressing the climate crisis.

### EPA’s Clean Trucks Plan

The Agency is working on the following actions over the next three years.

By December 2022, EPA will propose and finalize new stringent emissions standards to reduce nitrogen oxides (NO<sub>x</sub>) pollution from trucks starting in model year 2027. This action will include an update of current greenhouse gas (GHG) standards to capture market shifts to zero-emission technologies in certain segments of the heavy-duty vehicle sector.

EPA is also working on new stringent GHG emissions standards for heavy-duty engines and vehicles starting as soon as model year 2030.

Taken together, these new multi-pollutant standards will improve public health in our communities and set the U.S. on a course to achieve ambitious levels of GHG emissions reductions from commercial highway transportation over the long term.

EPA looks forward to working with all stakeholders as we move forward with these plans.

## Air Quality and Health Impacts of Heavy-Duty Vehicles

Pollution from heavy-duty trucks contributes to poor air quality and health across the country, especially in overburdened and underserved communities. Heavy-duty vehicles are the largest contributor (about 32%) to mobile source emissions of NO<sub>x</sub>, which react in the atmosphere to form ozone and particulate matter (PM). These pollutants are linked to respiratory and/or cardiovascular problems and other adverse health impacts that lead to increased medication use, hospital admissions, emergency department visits, and premature deaths.

**Mobile Source NO<sub>x</sub> (2017)**

Sources: MOVES3 for onroad and nonroad and 2017 National Emissions Inventory (NEI) for all other mobile sectors.

In addition, pollution from trucks directly affects people who live near roads and other areas of high truck activity like ports. Populations who live, work, or go to school near high-traffic roadways experience higher rates of numerous adverse health effects, and there is substantial evidence that people who live or attend school near major roadways are more likely to be low-income or people of color. NO<sub>x</sub> pollution from heavy-duty vehicles also impairs visibility and causes damage to terrestrial and aquatic ecosystems.

## Heavy-Duty Vehicles and Climate Change

Transportation is the largest source of GHG emissions in the United States, making up 29 percent of all emissions. Within the transportation sector, heavy-duty vehicles are the second-largest contributor, at 23 percent. Reducing GHG emissions is a critical step in reducing the probability of impacts from climate change, including heat waves, drought, sea level rise, extreme climate and weather events, coastal flooding, and wildfires. Some populations may be especially vulnerable to damages associated with climate change, such as the very young, the elderly, low-income people, the disabled, people of color, and indigenous populations.

## Mobile Source GHGs (2019)

Source: “Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2019,” EPA 430-R-21-005.

EPA previously took action to reduce GHG emissions from heavy-duty trucks with its Phase 1 and Phase 2 GHG standards. The Phase 2 standards began in model year 2021, with two additional steps of increasing stringency that will take effect in model years 2024 and 2027. The Phase 2 program promotes a new generation of cleaner, more fuel-efficient gasoline and diesel trucks.

## Opportunities for Significant Emissions Reductions from Heavy Duty Trucks: The Clean Trucks Plan

By December 2022, EPA will finalize a new standard for NO<sub>x</sub> emissions from heavy duty trucks starting with model year 2027. In this action, the agency will also explore updates to the Phase 2 GHG standards for certain heavy-duty fleets that are rapidly shifting toward zero-emission technologies.

EPA last revised the NO<sub>x</sub> standards for on-highway heavy-duty trucks and engines in 2001—more than 20 years ago. Although those standards achieved important NO<sub>x</sub> reductions, new technologies available today can help achieve the additional reductions we need to improve air quality and health in our communities.

Many state and local agencies across the country have asked the EPA to issue regulations that further reduce NO<sub>x</sub> emissions from heavy-duty trucks in order to protect the health of their communities. Such reductions are a critical part of many areas’ strategies to attain and maintain the health-based air quality standards, and to ensure that all communities benefit from improvements in air quality.

One area where technologies can improve emission outcomes relates to trucks operating at what are known as “low loads.” EPA’s analysis of trucking emissions has shown that current NO<sub>x</sub> controls are not effective under certain low-load operating conditions, such as when trucks idle, move

slowly, or operate in stop-and-go traffic. Emission control technologies that can help reduce NO<sub>x</sub> emissions under low-load conditions now exist, and they represent one area where EPA intends to focus as it develops a new NO<sub>x</sub> regulation.

Beyond such low-load NO<sub>x</sub> reduction technologies, the trucking sector has also seen advances in zero-emission technologies. In recent years, zero-emission heavy-duty trucks have begun entering the market in volumes that were not foreseen when EPA began the Phase 2 GHG program. Many of these zero-emission technologies are available today, and the number of products available, as well as production volumes, are expected to accelerate in the next few years. EPA will assess the impact that these zero-emission technologies will have on the overall effectiveness of the Phase 2 program and whether targeted adjustments to GHG standards in 2027 may be warranted.

Beyond 2027, heavy-duty truck manufacturers are already signaling a large-scale migration from gasoline and diesel engines to zero-emission technologies in their products. EPA is also working on revising GHG standards for all heavy-duty vehicles and engines. These standards would begin as soon as model year 2030.

## **For More Information**

For more information on these actions, please contact the U.S. Environmental Protection Agency, Office of Transportation and Air Quality through our webpage at: <https://www.epa.gov/transportation-air-pollution-and-climate-change/forms/contact-us-about-transportation-air-pollution>.

U.S. ENVIRONMENTAL PROTECTION AGENCY

# Climate Adaptation Action Plan

OCTOBER 2021

# **U.S. Environmental Protection Agency**

## **Climate Adaptation Action Plan**

October 2021

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY  
WASHINGTON, D.C. 20460

May 26, 2021

THE ADMINISTRATOR

**U.S. Environmental Protection Agency  
Policy Statement on Climate Change Adaptation**

The impacts of climate change are affecting people in every region of the country, threatening lives and livelihoods and damaging infrastructure, ecosystems, and social systems in communities across the nation. Certain communities and individuals are particularly vulnerable to these impacts, including low-income communities and communities of color, children, the elderly, tribes and indigenous people. Climate change can also exacerbate existing pollution problems and environmental stressors. All of these impacts challenge the U.S. Environmental Protection Agency's ability to accomplish its mission of protecting human health and the environment. As your Administrator, I believe we must take the actions necessary to ensure we continue to fulfill our mission even as the climate changes and work with other federal agencies to increase the resilience of the nation.

In his first week in office, President Joe Biden directed all federal agencies to integrate climate adaptation planning into their missions, programs and management functions to ensure their success in enhancing preparedness for and resilience to the climate crisis. For the EPA, this includes evaluating how climate change might affect our efforts to attain environmental standards given heat waves and more intense storms, increased use of pesticides given expanded lifespans and habitat of insects and impacts of rising seas and storm surges on hazardous waste sites and critical water infrastructure. Identifying strategies that deliver co-benefits for mitigation of greenhouse gases and other pollution, public health, economic growth and job creation, national security and environmental justice will be central to building a more resilient future.

In 2014, the EPA developed its first Climate Change Adaptation Plan and began to mainstream adaptation planning into the agency's work. We have partnered with other federal agencies, states, tribes, territories, local governments and international partners to promote climate resilience across the nation and internationally. Nevertheless, more needs to be done given the magnitude of this global challenge.

I am directing my leadership team, including assistant administrators, general counsel, associate administrators and regional administrators, to update the agency's 2014 Plan and to proactively incorporate climate adaptation planning into the agency's programs, policies, rules and operations, while we also work to reduce greenhouse-gas emissions. Specifically, I direct all EPA offices to work with the Office of Policy to complete or update their Implementation Plans, as relevant, to:

1. Integrate climate adaptation planning into EPA programs, policies and rulemaking processes.
2. Consult and partner with states, tribes, territories, local governments, environmental justice organizations, community groups, businesses and other federal agencies to strengthen adaptive capacity and increase the resilience of the nation, with a particular focus on advancing environmental justice.
3. Implement measures to protect the agency's workforce, facilities, critical infrastructure, supply chains and procurement processes from the risks posed by climate change.
4. Modernize EPA financial assistance programs to encourage climate-resilient investments across the nation.

The EPA will actively engage with organizations representing overburdened and underserved communities that are more vulnerable to climate impacts to ensure the EPA's adaptation plans reflect the principles of environmental justice and equity.

The Associate Administrator for the EPA's Office of Policy is designated as the agency's Senior Climate Change Adaptation Official and is responsible for working with EPA programs and regions to develop and carry out the activities described in the Action Plan.

Working together, we will act based on science and seize the opportunities that tackling the climate crisis presents.

A handwritten signature in black ink that reads "Michael S. Regan". The signature is written in a cursive, flowing style.

Michael S. Regan

## 1. Introduction

---

Climate change poses a real and present danger to communities all across the country. Its impacts are already being felt. President Biden’s Executive Order 14008, *Tackling the Climate Crisis at Home and Abroad*, requires federal agencies to develop Climate Action Plans that describe their agency’s climate vulnerabilities and the steps it will take to bolster adaptation and increase resilience to the impacts of climate change.

This 2021 EPA Climate Adaptation Action Plan (“Plan”) builds on a strong foundation. The agency released its first Climate Change Adaptation Plan in June 2014, followed by 17 Climate Change Adaptation Implementation Plans prepared by its National Environmental Program Offices, National Support Offices, and 10 Regional Offices. The 2021 Plan accelerates action and focuses agency attention on priority actions it will take to fulfill our mission and increase human and ecosystem resilience even as the climate changes.

This Plan will be followed by updates to the 17 *Implementation Plans* produced in 2014. Every office will report on its progress since 2014 and identify future actions to address the agency-wide priorities identified in this Plan. EPA offices will engage with states, tribes, territories, local communities, and other stakeholders when updating their plans.

## 2. Leadership

---

EPA’s FY 2023-2026 Strategic Plan includes a new goal focused on tackling the climate crisis. The goal includes three objectives that reflect priorities in Executive Order 14008, *Tackling the Climate Crisis at Home and Abroad*:

- Objective 1: Reduce Emissions that Cause Climate Change
- Objective 2: Accelerate Resilience and Adaptation to Climate Change Impacts
- Objective 3: Advance International and Subnational Climate Efforts

The 2021 EPA Climate Adaptation Action Plan contains five agency-wide priority actions and measures for evaluating performance that support Objective 2. The Plan also supports the agency’s and government-wide efforts to advance environmental justice.

The Office of Policy is responsible for the development, management, and execution of this Plan. The Associate Administrator for EPA’s Office of Policy is designated as the agency’s Senior Climate Change Adaptation Official. The official will work with the agency’s Chief Sustainability Officer and with EPA programs and regions to ensure implementation of the agency-wide priority actions and management activities described in this Plan.

The Cross-EPA Work Group on Climate Change Adaptation will support the goals of the Senior Adaptation Official and Chief Sustainability Officer by coordinating the implementation of this Plan across National Programs and Regional Offices. The work group includes representation from every National Environmental Program Office, Regional Office, and National Support Offices. The Senior Advisor for Climate Adaptation in the Office of Policy will chair the work group.

### 3. Climate Adaptation Vision for EPA

---

We live in a world in which the climate is changing. According to the U.S. Global Change Research Program, the Earth’s climate is warming and changing faster than at any point in the history of modern civilization, primarily because of emissions of heat-trapping greenhouse gases from fossil fuel combustion, deforestation, and land-use change. The changing climate is affecting people’s health and livelihoods and damaging infrastructure, ecosystems, and social systems in communities in every region of the nation.

In this changing world, the United States Environmental Protection Agency (EPA) is working to fulfill its mission to protect human health and the environment. EPA will take actions necessary to anticipate and plan for future

changes in climate and continue to fulfill its mission while advancing resilience and environmental justice across the nation. EPA will ensure its programs, policies, rules, enforcement and compliance assurance activities, and operations consider current and future impacts of climate change and how those impacts will disproportionately affect certain communities. It will develop and implement measures to protect its workforce, facilities, supply chains, and procurement processes from risks posed by climate change. Through climate change adaptation planning and implementation, EPA will continue to protect human health and the environment by reducing risks from climate change impacts while also working to reduce greenhouse gas emissions.

EPA will also work with its partners across the country to strengthen adaptive capacities and increase the resilience of the nation, with a particular focus on advancing environmental justice, in ways that support attaining the agency’s mission and that are within its statutory authority. States, tribes, territories, and local communities, as well as federal and international partners, share responsibility with EPA for protecting human health and the environment. These partnerships are critical for efficient, effective, and equitable implementation of climate adaptation strategies. EPA will also assist international partners that seek assistance on climate adaptation and capacity building issues.

EPA recognizes the need to holistically address mitigation of greenhouse gas emissions to limit the magnitude and rate of climate change while also adapting to those impacts that are unavoidable. In crafting and implementing its adaptation plan, the agency will identify strategies that deliver co-benefits for mitigation of greenhouse gases and other pollution, public health, economic growth and job creation, national security, and environmental justice—all of which will be central to building a more resilient future.

Of particular concern is that the impacts of climate change within and across U.S. regions and across the world will not be distributed equally. Certain communities and individuals are particularly vulnerable to the impacts of climate change, including low-income communities, children, the elderly, and

#### Climate Adaptation Vision

**EPA continues to fulfill its mission of protecting human health and the environment even as the climate changes and disruptive impacts increase.**

communities of color, tribes, and indigenous people. EPA will prioritize the most vulnerable populations with the goal of attaining a more equitable, just, and resilient future within and across communities.

EPA's commitments are part of a larger federal effort to pursue actions at home and abroad to avoid the most catastrophic impacts of climate change. As part of this whole-of-government approach, EPA will closely coordinate with other federal agencies on climate change adaptation challenges that cut across agency jurisdictions to improve the efficiency and effectiveness of the combined federal effort.

#### 4. Vulnerability Assessment

---

This section briefly describes the vulnerabilities of EPA's mission, facilities, and operations to climate change, and is organized by major program areas. Limitations in the adaptive capacity and resilience of our partners, the disproportionate impacts climate change has on certain communities, and the costs associated with implementing changes are also vulnerabilities for EPA across all program areas.

##### 4.1 Air quality

Although tremendous progress has been made improving air quality across the nation, climate change makes it more difficult to attain air quality standards and protect the quality of the air we breathe, posing higher risks to public health, and especially overburdened and vulnerable populations.

- *Tropospheric ozone levels may increase.* Higher temperatures and changes in circulation patterns, such as increased inversions, can increase tropospheric ozone levels and change the length of the ozone season unless ozone precursor emissions are reduced. This threatens attainment of air quality standards, thus necessitating stricter pollution controls, and increases risks of respiratory illness and premature death, especially in vulnerable populations.
- *Particulate matter (PM) concentrations may increase.* More frequent and severe wildfires due to climate change and windblown dust from regions affected by drought diminish air quality. Climate change increases the frequency of temperature inversions, which can trap particulate matter.

#### Definitions

**Climate change adaptation or climate adaptation means taking action to prepare for and adjust to both the current and projected impacts of climate change.**

**Adaptive capacity is the ability of a human or natural system to adjust to climate change (including climate variability and extremes) by moderating potential damages, taking advantage of opportunities, or coping with the consequences.**

**Climate resilience can be generally defined as the capacity of a system to maintain function in the face of stresses imposed by climate change and to adapt the system to be better prepared for future climate impacts.**

**Climate change mitigation refers to actions limiting the magnitude and rate of future climate change by reducing greenhouse gas emissions.**

**Increases in ozone due to climate change may make it more difficult to attain or maintain air quality standards.**

- *Climate change can worsen indoor air quality.* For example, changes in ambient humidity, and more frequent heavy rainfalls and floods can increase moisture in buildings, leading to higher mold concentrations, dust mites, bacteria, and other biological contaminants indoors. Wildfire smoke, airborne allergens, and other particle pollution from outdoors can infiltrate homes and buildings. More frequent power outages and use of portable generators can increase the risk of carbon monoxide poisoning indoors. Increased indoor pesticide applications in response to geographic shifts in pests and pest-borne disease can lead to higher exposures.
- *Climate change can make stratospheric ozone layer recovery more difficult.* The interactions between the changing climate and stratospheric ozone layer are complex, including changes in chemical transport, atmospheric composition, and temperature. These impacts could pose serious risks to human health, such as increased exposure to extreme heat and UV radiation.
- *Atmospheric deposition of pollutants may harm the environment.* The combination of patterns in the atmospheric deposition of sulfur, nitrogen, and mercury with global climate change has implications for the health of ecosystems, shifts of species, the chemistry of surface waters, and the production of methylmercury and its bioaccumulation in food webs.
- *The ability to measure, communicate, and model air quality may be affected.* Changes in meteorology (*i.e.*, increasing temperatures, changes in circulation, inversions) could alter where maximum concentrations occur, thereby affecting air monitoring network adequacy and EPA's ability to effectively model future air quality and provide useful information to the public. As the climate becomes less predictable and more dynamic, EPA's capacity to manage these worsening endpoints will degrade as the likelihood of extreme events increases and predictions become more difficult.

**Lower indoor air quality often disproportionately poses health risks to the young, the elderly, and other highly vulnerable people.**

## 4.2 Water quality

The quality of the nation's water bodies has substantially improved over the last half century but faces climate-related challenges.

- *Climate change degrades water quality through many pathways.* Impacts include lower stream flows or lake levels that concentrate pollutants; higher temperatures that reduce dissolved oxygen levels; higher carbon dioxide concentrations that increase the acidity of waterbodies; increased runoff of nutrients and other pollutants due to heavier precipitation events; more sewer overflows and wastewater bypasses; and, if combined with sufficiently high nutrient levels and temperatures, more harmful algal blooms, pathogens, and water related illnesses.
- *Sea level rise, higher temperatures, increasingly frequent and intense storm events, and acidification are degrading coastal ecosystems and reducing water supplies.* Coastal aquifers are already experiencing higher

**Vulnerable and underserved communities may be particularly at risk, from lack of access to clean and safe water as well as from limitations on their ability to prepare for and respond to climate-related events affecting their water infrastructure.**

salinity levels because of rising sea levels that intrude into groundwater supplies. Waterlines and coastline areas are shifting, threatening public safety and property. The inland migration of coastal wetlands can be blocked by human-made structures (e.g., levees, seawall), while higher water temperatures and salinity can alter the location of fish and coastal vegetation. These changes also lead to an increasing presence of invasive species.

- *Changes in snowpack and precipitation will affect water supplies.* Shrinking snowpack, earlier snowmelt, higher evaporation, and reduced precipitation can reduce water supplies and lead to more drying that can increase the risk of wildfires. Higher temperatures can also increase demand for water. Such impacts can increase competition for water across uses, including drinking water, agriculture, energy, recreation, and ecosystem protection.
- *Climate change is already harming water infrastructure.* Drinking water and wastewater treatment infrastructure can be overwhelmed or damaged by flooding, sea level rise, higher storm surges, and extreme events. These impacts may impede the functioning of drinking water intakes and wastewater outflows. They will also challenge the functioning and performance of stormwater infrastructure.

### 4.3 Contaminated sites

Despite ongoing progress in cleaning up contaminated sites and ensuring the safety of industrial facilities, climate change can exacerbate the already toxic conditions at contaminated sites, including polychlorinated biphenyl (PCB) cleanup sites subject to the Toxic Substances Control Act (TSCA), and can disrupt existing cleanup remedies.

- *Wildfire, more intense flooding and coastal storms, and sea level rise, can release pollution from contaminated sites and/or industrial facilities.* Wildfire ash, water inundation, and flooding may transport pollution out of sites, while increased salinity of aquifers from sea level rise may mobilize formerly stable contaminants. Many industrial areas are located near rivers, bays, harbors and other waterbodies, which makes contaminated sites more prone to releases of toxic materials to waters during floods. The release of these pollutants threatens the quality of waterways and groundwater sources of drinking water. It can also affect other services valued by the public, such as recreational opportunities.
- *Increased temperatures and changes in runoff can adversely affect cleanups.* Droughts can reduce water supplies for water-intensive remedies, while runoff from fire-scorched areas can introduce new contaminants to sites. Contaminants may become more volatile with higher temperatures, and climate change-induced changes in vegetation can affect ecological revitalization efforts. Droughts can increase wildfire frequency and intensity, which can damage containment infrastructure.
- *Unexpected, climate-driven conditions can compromise the effectiveness of cleanup remedies selected without those impacts in mind.* Sea level rise, rising groundwater tables, permafrost melt, or storm events may release formerly stable contaminants into groundwater or soil. Treatment

**Contaminated sites are often in or near overburdened and underserved communities. These communities are likely to bear greater risks and burdens from climate-driven extreme events and to have a harder time recovering.**

systems, caps, and other remedies may be rendered ineffective. For example, Alaskan landfills situated on melting permafrost are contaminating local water supplies and threatening the health of ecosystems and communities.

- *Climate impacts can increase the amount of debris sent to landfills and can also encroach on the landfills.* Climate change is expected to produce more frequent and powerful natural disasters, which will increase the amount of disaster-related wastes.

#### 4.4 Chemical safety and pollution prevention

*Rising temperatures, changes in precipitation, runoff, and soil moisture, and shifts in ecosystems can affect the presence and concentration of chemicals in the environment.*

*Climate change and subsequent alteration of ecosystems will likely result in changes in where crops are grown and in the presence of pests and diseases.* As pests move into new areas, pest management practices and application of pesticides may expand. This may lead to more chemicals present in soil and water. Chemical safety may be affected by changing chemical use patterns resulting from climate change. An increase in the frequency of new pest problems could trigger requests for emergency exemptions under the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) if currently registered pesticides are ineffective.

#### 4.5 EPA's facilities and operations

The EPA has identified the following vulnerabilities to the agency's continued safe and efficient operations (elaborated on in parts 6 and 7 of the Plan):

*Increased frequency and severity of extreme weather events can affect the agency's personnel safety, facilities, physical security, and emergency communications.* EPA facilities, particularly in coastal areas, can be damaged by more intense high winds, flooding, or storm surges. More intense or frequent flooding can also block road access to EPA facilities. Long-term environmental monitoring assets can be damaged by more high winds, floods, or lightning, which can also disrupt the supplies of electric power to EPA facilities. In addition, changes in water supply or quality can impair the agency's ability to manage its facilities and conduct important research, particularly in drought-prone areas. These impacts can also pose challenges to the EPA labs, researchers, and companies EPA works with to accomplish their work.

**Poor air quality, fires, floods, hurricanes, and other extreme events present risks to EPA employees and contractors engaged in field work, such as sampling, remediation, and inspections.**

*Flooding and other climate change hazards can damage records or monitoring equipment needed to evaluate compliance with environmental laws.* EPA's enforcement and compliance assurance and monitoring activities are based on records and site visits and/or remote monitoring by EPA and regulated facilities. Agency enforcement and compliance systems assurance activities could be compromised if EPA, state, or regulated facilities were damaged.

*The planning and management of emergency operations can be limited by increased frequency and severity of extreme weather.* Increased extreme weather can reduce availability of the agency's staff and

resources to support the dispatch of emergency management personnel to assess environmental damage and to test sites for air quality, water quality, and other human health and environmental threats.

## 5. Agency-wide Climate Adaptation Priorities

---

EPA has identified priority actions it will take to integrate climate change adaptation into its programs, policies, rules, enforcement and compliance assurance activities, and operations. These priorities represent EPA's commitment to address its programs' vulnerabilities to climate change.

The following tables provide detailed information about the work EPA will do in each of the priority areas.

### Climate Adaptation Priorities

1. Integrate climate adaptation into EPA programs, policies, rulemaking processes, and enforcement activities.
2. Consult and partner with states, tribes, territories, local governments, environmental justice organizations, community groups, businesses, and other federal agencies to strengthen adaptive capacity and increase the resilience of the nation, with a particular focus on advancing environmental justice.
3. Implement measures to protect the agency's workforce, facilities, critical infrastructure, supply chains, and procurement processes from the risks posed by climate change.
4. Measure and evaluate performance.
5. Identify and address climate adaptation science needs.

### Priority Action 1: Integrate climate adaptation into EPA programs, policies, rulemaking processes, and enforcement activities.

---

**Action Description:** As much as possible and consistent with its authorities and available resources, the EPA will account for the impacts of climate change and related environmental justice concerns as it designs, implements, and assesses its programs, policies, rules, and enforcement and compliance assurance activities to ensure they are effective and resilient to climate change. The agency will train its management and staff to integrate adaptation into decision-making processes. EPA will develop decision-support tools and provide technical assistance to enable staff to integrate climate adaptation into programs and to identify strategies that will also

---

---

yield co-benefits, such as reducing greenhouse gases and other pollution, and advancing environmental justice.

---

**Action Goal:** Effectively integrate climate adaptation planning into EPA’s programs, policies, rulemaking processes, and enforcement activities.

---

**Agency Leads:** Office of Policy and Office of Enforcement and Compliance Assurance

---

**Risk or Opportunity:** The opportunity is to enhance the agency’s ability to fulfill its mission of protecting public health and the environment even as the climate changes.

---

**Scale:** The agency will implement this priority across all the Programs and Regional Offices.

---

**Timeframe:** The agency will commence these activities in FY 2021. It is anticipated this will be an ongoing process.

---

**Implementation Methods:** To successfully achieve this priority action, EPA will:  
**Integrate climate change adaptation into rulemaking processes**  
EPA will integrate information about the impacts of climate change into rulemaking processes consistent with its authorities. EPA will consider a variety of “entry points,” including the development of the rule itself; related policy and guidance development; outreach to stakeholders, especially overburdened and underserved communities that are more vulnerable to climate impacts; post-rule permitting; and monitoring and enforcement and compliance assurance activities.

EPA will update guidance on rulemaking processes to include more explicit consideration of climate change. EPA developed this process to guide the agency’s rulemaking activities from the start of the rulemaking process through the analysis of regulatory options to the final publication of a regulation. EPA will integrate climate adaptation into these processes by:

- **Pinpointing process points where climate change adaptation considerations warrant identification and analysis.** The rulemaking process includes opportunities to discuss climate change adaptation considerations, both internally and with stakeholders.
  - **Developing guidance documents and training rule writers to understand the implications of climate change impacts and incorporate these considerations into rulemaking.** EPA will develop a guide for climate change adaptation and provide training in the same
-

---

way it has issued guidance on addressing children’s health and environmental justice for all rulemakings.

- **Engaging the most vulnerable communities from the beginning of the rulemaking process.** Meaningful engagement will help EPA to understand the disproportionate vulnerabilities of certain communities and consider these vulnerabilities throughout the rulemaking process.

#### **Integrate climate adaptation criteria into financial mechanisms**

The agency will modernize its financial assistance programs to encourage and support smarter, more climate-resilient investments by states, tribes, territories, and local communities. It will do so by integrating climate adaptation considerations, as appropriate, into discretionary and non-discretionary financial mechanisms. This includes agency grants, cooperative agreements, loans, technical assistance, contracts, and awards where the project’s desired outcomes are sensitive to climate change (*e.g.*, clean air; safe drinking water; site cleanups).

#### **Integrate climate adaptation remedy selection for cleanup sites**

EPA will update and develop policies addressing sea level rise in remedy selection for cleanup sites managed by EPA under RCRA and TSCA. EPA will develop guidance on how to address sea level rise in PCB cleanup approvals with input from PCB Regional Coordinators. EPA will update its Guidance on RCRA Corrective Action Decision Documents: Statement of Basis to address sea level rise considerations.

#### **Develop Decision-Support Tools that Enable EPA Staff and Partners to Integrate Climate Adaptation Planning into their Work**

Many standard analytical practices may be less effective unless they account for climate change. For example, standard methods used for estimating the probability and expected frequency of floods for flood plain mapping, designing infrastructure, and estimating runoff of pollutants and sediments entering rivers and streams are based on historical data rather than scientifically credible expectations of future conditions. EPA and its partners need to alter their standard practices and decision routines to account for a continuously changing climate and how climate change will disproportionately affect certain communities.

The development of decision-support tools plays a central role in EPA and our stakeholder’s efforts to adapt to climate change. Following the recommendations of the National Research Council, EPA is committed to

---

developing decision-support tools to improve the quality and efficacy of decisions sensitive to climate change and related environmental justice considerations. These tools will empower EPA staff and their partners to consider climate, as well as changes in social and economic conditions that are influenced by climate change. They will enable staff to integrate climate adaptation and justice considerations into their work and decision-making processes. Priority will be given to the development of tools that support the agency's direct program implementation requirements and benefit multiple end users within and outside EPA.

**Update National Program and Regional Office Implementation Plans**

Upon publication of this Plan, the EPA National Program Offices and Regional Offices will update their respective Implementation Plans to report on progress they have made integrating climate adaptation into their work and to identify actions they will take to address the five agency-wide priorities identified in the new EPA Climate Action Plan.

The updated Implementation Plans will ensure climate adaptation and resilience are a high priority within the core missions and priorities of the Program and Regional Offices. In addition, the Office of Policy and the Office of Enforcement and Compliance Assurance will develop plans for the first time. All Program and Regional Offices will report annually on progress with implementation efforts.

---

**Performance:**

The agency will monitor progress using the following measures:

Long-Term Measure:

- Starting in 2021, EPA will increase integration of climate change adaptation into programs, policies, and rules and is committed to developing and implementing Climate Adaptation Implementation Plans for all EPA Programs and Regions.

Interim Measures:

- Program and Regional offices will develop and implement Climate Adaptation Implementation Plans that contain goals, measures, commitments, and implementation strategies.
  - EPA programs will develop adaptation training for programs and staff.
  - EPA will train managers and staff on how to integrate climate adaptation into their job duties.
  - The number of agency employees who access the internal Adaptation Resource Center and/or the public ARC-X system for programmatic tools and information will increase by 25% per year.
-

<b>Intergovernmental Coordination:</b>	EPA will support capacity building for state, tribal, territorial, local, and international partners by working with them to develop and use effective decision-support tools. EPA will coordinate with other Federal agencies on developing decision-support tools with partners, when appropriate.
<b>Resource Implications:</b>	The agency will need additional personnel and funding resources to successfully implement this priority action.
<b>Challenges/Further Considerations:</b>	Management of limited resources (personnel and funding) to support the breadth of climate adaptation activities across all Programs and Regions.
<b>Examples of Accomplishments to Date:</b>	<ul style="list-style-type: none"> <li>• Adaptation training for all new EPA employees.</li> <li>• Training for partners: <i>Local Government Climate Adaptation Training and Understanding Climate Change Impacts on Water Resources</i>.</li> <li>• Visual mapping tool: Region 1 tool to assist EPA in assessing climate impacts on contaminated sites.</li> <li>• Integrating climate change into Superfund cleanup processes: Training and technical support for remedial project managers on conducting site-level risk assessments that incorporate information on potential impacts of climate change effects.</li> </ul>

**Priority Action 2: Consult and partner with states, tribes, territories, local governments, environmental justice organizations, community groups, businesses, and other federal agencies to strengthen adaptive capacity and increase the resilience of the nation, with a particular focus on advancing environmental justice.**

<b>Action Description:</b>	<p>States, tribes, territories, and local governments, in partnership with EPA and other Federal Agencies, share responsibility for increasing resilience and adapting to climate change in a manner that advances environmental justice. These partnerships will be critical for efficient, effective, and equitable implementation of climate adaptation strategies. EPA’s Regional and Program Offices will work with their partners, engage local stakeholders, and use a diversity of approaches to build adaptive capacity and encourage locally relevant climate action.</p> <p>The EPA will support states, tribes, territories, communities, and businesses by producing and delivering the training, tools, technical support, data, and information they need to adapt and increase resilience to climate change. The agency will also support more climate-resilient investments by states, tribes, territories, and local communities and encourage the use of more climate-friendly adaptation measures (<i>e.g.</i>, solutions that reduce, rather than increase, energy use).</p>
----------------------------	---

<b>Action Goal:</b>	Build and strengthen the adaptive capacity of states, tribes, territories, communities and businesses.
<b>Agency Lead:</b>	Office of Policy
<b>Risk or Opportunity:</b>	The opportunity is to help increase the resilience of the nation to the impacts of extreme weather events and climate change.
<b>Scale:</b>	The agency will implement this priority across all the Programs and Regional Offices.
<b>Timeframe:</b>	The agency will commence these activities in FY 2021. It is anticipated this will be an ongoing process.
<b>Implementation Methods:</b>	<p>To successfully achieve this priority action, EPA will:</p> <p><b><u>Implement Mechanisms for Building Adaptive Capacity</u></b></p> <ul style="list-style-type: none"> <li>• <u>Training</u>: increasing awareness of ways climate change may affect their ability to implement effective programs.</li> <li>• <u>Tools and information</u>: providing access to tools, data, and information to support decision making.</li> <li>• <u>Technical assistance</u>: working with states, tribes, territories, and communities to help develop and implement locally led plans</li> <li>• <u>Financial incentives</u>: supporting climate-resilient investments in communities</li> </ul> <p><b><u>Advance Environmental Justice</u></b></p> <p>The agency places special emphasis on working with overburdened and vulnerable populations to increase their resilience to climate change. Such populations include communities of color, low-income communities, children, persons with disabilities, the elderly, tribes, and indigenous people. These groups and individuals may be especially vulnerable to climate change impacts due to a variety of factors including, higher pollution burdens, disproportionate exposure to environmental contaminants, lack of financial resources, limited access to quality health care, and other barriers.</p>

---

For example, the elderly are more vulnerable to heat stress because they are often in poorer health, have chronic diseases, and are less able to regulate their body temperature during periods of extreme heat. Communities of color often face

disproportionate climate risks from the continuing impacts of inequitable treatment and discrimination.

**The Agency will support the most overburdened and vulnerable communities to improve their capacity to prepare for, cope with, and recover from climate change impacts.**

Climate change poses risks to children's health. It increases children's risk of becoming ill or dying due to extreme heat; decreases lung maturation due to exposure to ground-level ozone and particulate matter; increases asthma and other allergic respiratory diseases from exposure to aeroallergens and ozone, among others; increases illness from harmful algal blooms and other waterborne pathogens; exacerbates adverse impacts on cognitive development and the capacity of the body to regulate emotions; and has the potential to worsen depression, anxiety, phobia, and panic because of exposure to disasters and displacement.

The EPA's efforts to anticipate and adapt to the effects of climate change will help the most vulnerable people and places reduce their exposure to climate change and improve their capacity to prepare for or avoid adverse impacts. For example, EPA will actively engage with community-based organizations from overburdened and underserved communities that are more vulnerable to climate impacts to ensure National Program and Regional Office Implementation Plans reflect the principles of environmental justice and equity.

The agency will make special efforts to work with those who have been historically underrepresented in decision making, such as tribal nations and communities of color, to develop adaptation plans that improve their capacity to prepare for, cope with, and recover from climate change impacts. The agency will also continue to focus on the life stages during which people are most vulnerable to climate change. Development of effective, equitable, and just adaptation plans and strategies will require EPA to identify how pre-existing social inequities limit a community's adaptive capacity and respond accordingly.

#### **Support Tribes and Indigenous Peoples to Increase Adaptive Capacity**

EPA recognizes that tribes and indigenous peoples are disproportionately vulnerable to the impacts of climate change, due in part to their dependence on specific geographic areas for their livelihoods; unique

---

---

cultural, economic and political characteristics; and limited resources to prepare for, respond to and recover from climate-related hazards.

The agency, in keeping with the Federal Trust Responsibility, will assure that tribal concerns and interests are considered whenever EPA's actions and/or decisions may affect Indian country. Pursuant to EPA's Policy on Consultation and Coordination with Indian Tribes, EPA engages in government-to-government consultation with tribes when actions or decisions may affect their tribal interests. EPA is committed to engaging in timely consultation and coordination on a government-to-government basis to implement this plan and help tribes address their climate adaptation concerns.

The EPA Policy on Environmental Justice for Working with Federally Recognized Tribes and Indigenous Peoples (EJ Tribal/Indigenous Policy) guides how EPA conducts work with federally recognized tribes, indigenous peoples, other federal and state agencies, and other stakeholders in Indian country and throughout the United States to advance environmental justice, such as climate justice. EPA engages and works with indigenous peoples (as defined in the EPA Tribal/Indigenous Policy) separately and differently from our work with federally recognized tribes. Our work with indigenous peoples may include support for community-based climate adaptation efforts.

The agency will support the development of climate science to meet priority research needs and decision-support tools useful to the tribes and indigenous peoples. EPA will work with tribes and indigenous peoples to identify and support the use of climate change relevant traditional ecological knowledge (TEK) in decision making. EPA recognizes that TEK, as an expression of key information that links historical, cultural, and local ecological conditions, may help tribes and indigenous peoples choose how they adapt to climate change while also protecting resources and the uses of those resources important to their culture and livelihood. These efforts will leverage existing EPA partnerships with the tribes, tribal networks, indigenous peoples, and indigenous networks.

On a national level, EPA will work with other Federal agencies to collectively support tribes and indigenous peoples as they assess their vulnerabilities to climate change and plan and implement adaptation actions. Regional Offices will seek opportunities to work together with other Federal agencies' regional offices to provide strong support to tribes and indigenous peoples on their climate change challenges.

<b>Performance:</b>	The agency will monitor progress using the following measures:
	<u>Long-Term Measure:</u>
	<ul style="list-style-type: none"> <li>• EPA will strengthen the adaptive capacity of states, tribes, territories, local governments, environmental justice organizations, community groups, and businesses, with a particular focus on advancing environmental justice, by increasing the number EPA has assisted, through grants or technical assistance, to 1) develop or update their climate resilience/adaption plans and/or 2) implement an action to anticipate, prepare for, and adapt to climate change.</li> </ul>
	<u>Interim Measures:</u>
	<ul style="list-style-type: none"> <li>• Increase the number of climate adaptation or community resilience-building planning or implementation efforts in overburdened and underserved communities in which EPA contributes resources, technical assistance, and/or actively participates.</li> <li>• Increase the number of unique and returning external visitors to the ARC-X system.</li> <li>• Increase the number of state-level and regional-level versions of the ARC-X system developed by universities with EPA support.</li> <li>• Include climate adaptation evaluation criteria in Grant Guidance and Requests for Proposals.</li> <li>• Increase the number of states, territories, local governments, environmental justice organizations, community groups, and businesses, with a particular focus on advancing environmental justice, that have incorporated climate change adaptation into the implementation of their environmental programs supported by major EPA financial mechanisms.</li> <li>• Support federally recognized tribes in incorporating climate adaptation into at least one program supported by an EPA grant.</li> </ul>
<b>Intergovernmental Coordination:</b>	EPA will consult and partner with states, tribes, territories, environmental justice organizations, community groups, businesses, and other federal agencies to successfully implement this priority action.
<b>Resource Implications:</b>	The agency will need additional personnel and funding resources to successfully implement this priority action.
<b>Challenges/Further Considerations:</b>	Management of limited resources (personnel and funding) to support the breadth of climate adaptation activities across all Programs and Regions.
<b>Examples of Accomplishments to Date:</b>	<ul style="list-style-type: none"> <li>• EPA’s Climate Change Adaptation Resource Center (ARC-X) is an innovative system designed to help all 40,000 communities across the United States anticipate, prepare for, and adapt to the impacts of</li> </ul>

---

climate change ([www.epa.gov/arc-x](http://www.epa.gov/arc-x)). It provides users with an integrated package of information tailored specifically to their needs.

- EPA has supported the development of state-level and regional-level versions of the ARC-X system by universities. The Indiana University ERIT system is one example (<https://eri.iu.edu/erit/index.html>).
- EPA has modernized the financial assistance programs below to encourage climate-resilient investments. These programs now incorporate specific criteria, allow for adaptation planning, or otherwise encourage communities to anticipate, plan for, and adapt to the changing climate. Examples include:
  - Brownfields grants
  - Indian General Assistance Program
  - Environmental Justice Small Grants Program
  - State Revolving Funds
  - Wetland program grants
- EPA has provided technical support:
  - Support for tribes in the Pacific Northwest and Alaska: New EPA Region 10 webpage providing support to tribal communities on climate adaptation issues in Alaska, Idaho, Oregon, and Washington.
  - Providing adaptation planning assistance to Tribes: Support for the Pala Band of Mission Indians to build Tribal capacity to address the health effects of climate change.
- EPA has provided tools:
  - EJSCREEN: Climate is incorporated into EPA’s environmental justice mapping and screening tool.
  - Climate Resilience Evaluation and Awareness Tool (CREAT): A software tool to assist drinking water and wastewater utility owners and operators in understanding potential climate change threats and in assessing the related risks at their individual utilities.
  - Stormwater Calculator with Climate Assessment Tool: Desktop application that estimates the annual amount of rainwater and frequency of runoff from a specific site anywhere in the United States. The calculator includes future climate vulnerability scenarios.

---

### **Priority Action 3: Implement measures to protect the agency’s workforce, facilities, critical infrastructure, supply chains, and procurement processes from the risks posed by climate change.**

---

**Action Description:** The EPA is committed to the safety of its personnel, the integrity of its buildings, the efficiency of its operations, and the sustainability of the communities in which its facilities are located. However, the impacts of climate change, including more frequent and intense storms, wildfires,

---

water shortages, and sea level rise, pose risks to meeting these objectives. Climate change could disrupt the operation of the agency’s programs, compromise the safety of its staff, or affect the integrity of its physical infrastructure. Adaptation planning to protect EPA’s workforce, operations, underlying infrastructure, and supply chains is crucial.

Where appropriate, EPA will develop and implement new measures to protect its workforce and increase the resilience of its facilities and operations to climate change. More detailed information about the specific actions the agency will take to ensure climate-ready sites and facilities appears in Part 7 of this Plan. Information about the specific actions the agency will take to ensure a climate-ready supply of products and services appears in Part 8 of this Plan.

---

<b>Action Goal:</b>	Increase the resilience to climate change of the agency’s facilities and operations, including critical supply chains.
<b>Agency Lead:</b>	As the office within EPA responsible for facilities, transportation, security, health and safety, human resources, grants, and procurement, the Office of Mission Support (OMS) is responsible for ensuring the safe and continued operation of the agency’s facilities, contracts, grants, and human resources programs.
<b>Risk or Opportunity:</b>	Without specific action, climate change may (1) adversely affect critical facilities and assets across the nation, and (2) jeopardize the availability of essential services and supplies.
<b>Scale:</b>	This agency will implement these actions at mission-critical assets across the nation.
<b>Timeframe:</b>	The agency will commence these activities in FY 2021. It is anticipated this will be an ongoing process.
<b>Implementation Methods:</b>	<ul style="list-style-type: none"><li>• Where possible, EPA will enhance the resilience of existing facilities in coastal areas to protect them from severe weather, flood damage, and sea level rise.</li><li>• The agency will also work with the General Services Administration and other government agencies, including local government agencies, to account for climate change in the location, design, and construction of new facilities, or when new buildings are leased so the agency invests in long-term climate-smart infrastructure and operations.</li></ul>

---

---

**Performance:**

The agency will monitor progress using the following measures:

Long-Term Measure for Facilities:

- EPA will initiate priority climate resiliency projects for EPA-owned facilities within 24 months of a completed facility climate assessment and project prioritization.

Interim Measures for Facilities:

- EPA will 1) define climate resiliency for EPA facilities and 2) conduct a climate assessment of all 20 owned facilities to determine which facilities require investments to protect against climate and weather change.
- EPA may prioritize identified projects based on multiple factors – ability to execute, impact on facility resiliency, cost, etc.
- EPA will initiate 100% of the highest priority projects within 24 months of assessment completion and prioritization.

Interim Measures for Acquisitions:

To further advance a climate-robust supply of goods and services that prioritize climate readiness and prompt innovation in materials, products, and contracting to meet mission needs, EPA will:

- Develop and implement acquisition policy to incorporate climate change considerations in the advance acquisition planning process (requirements and solicitation development for contractor response) through consideration and assessment of climate change risks and climate change innovations associated with the goods and services to be procured.
- Develop and implement a Supply Change Management Program which will include assessment of supply chain risk, with emphasis on climate change risk assessment and mitigation to ensure consistent monitoring.
- Perform an in-depth assessment of climate change supply chain risk for EPA mission critical contracts by applying the “GSA Framework for Managing Climate Risks in Federal Supply Chains” and the seven screening questions provided by CEQ.

---

**Intergovernmental Coordination:**

OMS works in close coordination with the Federal Chief Sustainability Officer, the General Services Administration, and other Federal agencies.

---

**Resource Implications:**

The agency will need additional personnel and funding resources to successfully implement this priority action.

---

**Challenges/Further Considerations:**

Management of limited resources (personnel and funding) to support the breadth of climate adaptation activities across all Programs and Regions.

---

---

**Examples of Accomplishments to Date:**

EPA has made progress in both mitigating greenhouse gas emissions and preparing for climate change. The agency's Strategic Sustainability Performance Plan (SSPP), for example, outlines numerous goals and achievements in reducing the agency's greenhouse gas emissions, energy dependence, water use requirements, solid waste, pollution, and other environmental impacts. EPA also has in place an extensive continuity of operations plan (COOP) designed to prepare for natural disasters and other events that could interrupt agency operations.

---

**Priority Action 4: Using Measurement, Data and Evidence to Evaluate Performance**

**Action Description:**

The EPA recognizes the importance of monitoring and evaluating performance and acting on the lessons learned. The EPA will evaluate its climate change adaptation actions on an ongoing basis to assess its progress toward (1) integrating climate adaptation throughout the agency's programs, policies, rules, enforcement and compliance assurance activities, and operations; (2) modernizing financial assistance programs in ways that encourage climate-resilient investments; (3) providing the information, tools, training, and technical support that communities need to increase resilience and adapt to climate change; and (4) advancing equity and justice to support the needs of the most overburdened and vulnerable communities in responding to climate change. Through ongoing evaluation, the agency will learn how to effectively integrate climate adaptation into its activities. The EPA will evaluate what worked and why, as well as what didn't work and why not. Based on the lessons, the EPA will adjust the way adaptation is integrated into its activities.

The EPA will track and evaluate its progress toward integrating climate adaptation into the agency's programs, policies, rules, enforcement and compliance assurance activities, and operations and its progress in supporting partners to do the same. EPA is committed to building and using data, measurement, and other evidence to evaluate the effectiveness of climate adaptation tools, activities, program management, and policy approaches. Through ongoing evaluation, the agency will learn how to integrate climate adaptation planning more effectively across its programs and across the country.

Adaptation to climate change will happen in stages, and measures should reflect this evolution. The earliest changes in many programs will be changes

---

in knowledge and awareness (*e.g.*, increase in the awareness of EPA staff and their external partners of the relevance of adaptation planning to their programs). Building on this knowledge, they then will begin to change their behavior (*e.g.*, increase their use of available decision support tools to integrate adaptation planning into their work). Finally, in the long term, adaptation planning efforts will lead to changes in conditions (*e.g.*, percentage of flood-prone communities that have increased their resilience to storm events) to directly support EPA’s mission to protect human health and the environment.

The EPA will establish long-term measures under the agency’s FY 2022-2026 Strategic Plan, as well as supporting annual measures in the FY 2023 Congressional Justification and appropriate internal metrics.

---

**Action Goal:** Through ongoing evaluation, the agency will learn how to effectively integrate climate adaptation into its activities.

---

**Agency Lead:** Office of Policy

---

**Risk or Opportunity:** Limitations on the agency’s ability to use particular data collection techniques (*e.g.*, surveys of local government officials to evaluate the usefulness of EPA tools), will limit its ability to conduct informative evaluations.

---

**Scale:** All EPA Programs and Regions.

---

**Timeframe:** The agency will commence these activities in FY 2021. It is anticipated this will be an ongoing process.

---

**Implementation Methods:** The EPA will use a combination of long-term and interim measures to assess progress. However, it will be an ongoing challenge to measure the direct impact of EPA’s adaptation planning activities on the resilience of its programs and on the human health and environmental outcomes it is striving to attain. Long-term measures assess the climate adaptation outcomes we are ultimately trying to influence, but the results often come months or years after EPA provides support. The interim measures are more immediate actions EPA staff can take (*e.g.*, including adaptation criteria in grant solicitations, training,

**EPA will use performance measurement, data analysis, evaluation, and other evidence-building activities to understand which climate adaptation strategies work, what can be improved, and what information gaps exist.**

---

development of decision support tools) to move us closer to achieving our climate adaptation goals.

---

**Performance:** The agency will monitor progress using the following measures:

Long-Term Measure:

- EPA will measure its progress on enhancing the adaptive capacity of states, tribes, territories, and communities by creating a robust measurement system that includes both output and outcome measures.

Interim Measures:

- EPA will include Climate Adaptation in its 2022-2026 Strategic Plan and develop both Long-Term Performance Goals and Annual Performance Goals to track progress.
  - EPA will update this plan and report on progress annually.
  - EPA will evaluate progress on its climate adaptation support for overburdened and vulnerable communities.
- 

**Intergovernmental Coordination:** The agency will work closely with OMB to seek approval for the use of survey mechanisms.

---

**Resource Implications:** The agency will need additional personnel and funding resources to successfully implement this priority action.

---

**Challenges/Further Considerations:** Management of limited resources (personnel and funding) to support the breadth of climate adaptation activities across all Programs and Regions.

---

**Examples of Accomplishments to Date:**

- Using Google Analytics, EPA has monitored the use of its Climate Change Adaptation Resource Center (ARC-X) from October 2016 through June 2021. Data indicate: (1) a steady increase in annual repeat, unique users of the system, and (2) usage of the system in all 50 states. Desired enhancements to the system have been identified.

---

## Priority Action 5: Identify and address climate adaptation science needs.

---

**Action Description:** Implementing effective strategies to adapt to the changing climate requires that decisions be grounded in the best available science on climate change risks, impacts and vulnerabilities, and adaptive management practices. Throughout EPA, there is a growing need for up-to-date information on the existing data and information, models, and tools relevant to climate change adaptation.

EPA has made progress conducting climate-related research and developing models and tools. EPA will support an agency-wide approach to identify and update priority research needs, including social science research, related to climate change adaptation.

**EPA's Office of Research and Development will reinforce scientific integrity and coordinate with the Program and Regional Offices to identify and address priority research needs for the entire agency to support the integration of adaptation planning into the agency's activities.**

EPA will advance a rigorous exploratory and applied climate adaptation science program by conducting climate-related research in its labs and centers, supporting research through its grants program, conducting policy-relevant assessments, communicating research and assessment results, and delivering innovative and sustainable solutions. EPA will coordinate and collaborate with other agencies and the scientific community to provide access to the best available science, technologies, and practices.

---

**Action Goal:** Production and delivery of research results that benefit multiple Programs and Regional Offices across EPA, our partners, and others across the world.

---

**Agency Lead:** Office of Research and Development: The EPA Office of Research and Development (ORD) has the primary responsibility for coordinating with the Program and Regional Offices to identify the priority science needs of the agency and its partners. ORD is also EPA's primary representative to the U.S. Global Change Research Program (USGCRP).

---

**Risk or Opportunity:** The opportunity is the production of research results that yield benefits to multiple EPA Programs and Regions, as well as partners across the nation.

---

**Scale:** ORD will engage all the EPA National Program Offices and the 10 Regional Offices, other federal agencies, and partners across the nation.

---

<b>Timeframe:</b>	The agency will commence these activities in FY 2021. It is anticipated this will be an ongoing process as new scientific information emerges ( <i>e.g.</i> , with the production of the 5 <sup>th</sup> National Climate Assessment).
<b>Implementation Methods:</b>	<ul style="list-style-type: none"> <li>• A Subgroup of the Cross-EPA Work Group on Climate Adaptation will be established to oversee this priority action. ORD will chair the Subgroup.</li> <li>• The Subgroup will adhere to EPA’s Scientific Integrity Policy. This policy provides a framework intended to ensure scientific integrity throughout the EPA and promote scientific and ethical standards.</li> <li>• To facilitate the ongoing sharing of information, the EPA will establish a central repository of information and EPA tools related to climate adaptation. The repository will also include information (“lessons learned”) about methods for integrating climate adaptation that EPA offices have used that may be applicable to other users within the agency or by EPA’s federal, state, tribal, territorial, or local government partners. EPA will collaborate with other federal agencies to develop and maintain a means to ensure access to climate adaptation data.</li> <li>• ORD resources will be used to establish an EPA Regional Climate Science Network which will address the growing need in each Regional Office for <u>local</u> and <u>region-specific</u> scientific and technical expertise to inform citizens, communities, and agency decision makers in their efforts to anticipate, prepare for, adapt to, and recover from climate-driven extreme events and their impacts to clean air, water, and land.</li> </ul>
<b>Performance:</b>	<p>The agency will monitor progress using the following measures:</p> <p><u>Long-Term Measure:</u></p> <ul style="list-style-type: none"> <li>• EPA will have a rigorous exploratory and applied climate adaptation science program that provides climate-relevant data, tools and information to EPA staff and partners.</li> </ul> <p><u>Interim Measures:</u></p> <ul style="list-style-type: none"> <li>• EPA will assess priority climate adaptation science needs for its Program and Regional Offices and develop a proposal for meeting those needs.</li> <li>• ORD will support EPA Programs and Regions to base climate adaptation decisions on sound science and in alignment with the Scientific Integrity Policy.</li> <li>• EPA will establish a central repository of information and EPA tools related to climate adaptation.</li> </ul>
<b>Intergovernmental Coordination:</b>	<ul style="list-style-type: none"> <li>• ORD will play a major role representing EPA’s needs to other federal agencies and in partnering with other organizations, including those based in—or partnering with—overburdened and vulnerable communities, to develop nationally and internationally relevant research and information and the means to deliver that information to users at all levels.</li> </ul>

- ORD will coordinate with the U.S. Global Change Research Program (USGCRP) and its 13 member agencies to advance a rigorous exploratory and applied climate adaptation science program and to engage partners across the nations to identify their priority research needs.
- ORD will support development of the 5<sup>th</sup> National Climate Assessment by contributing to interagency coordination and leadership, authorship, and review.

**Resource Implications:**

The agency will need additional personnel and funding resources to successfully implement this priority action. Establishment of an EPA Regional Climate Science Network will require significant additional funds and personnel in order to support all 10 EPA Regional Offices.

**Challenges/Further Considerations:**

Management of limited resources (personnel and funding) to support the breadth of climate adaptation activities across all Programs and Regions.

**Examples of Accomplishments to Date:**

- Development and updating of EPA’s Scientific Integrity Policy.
- EPA Contributions to the 4<sup>th</sup> U.S. National Climate Assessment.
- EPA Contributions to the USGCRP report, “The Impacts of Climate Change on Human Health in the United States”
- ORD contributions to the development of numerous decision support tools for climate adaptation, such as the BASINS environmental analysis system designed to help regional, state, and local agencies perform watershed- and water quality-based studies.

**6. Enhance Climate Literacy of the EPA Workforce and Our Partners**

An organization must craft and adopt new means of achieving its goals as circumstances change. To respond to climate change, EPA needs its personnel and partners to adopt new ways of achieving its mission. EPA will build capacity through ongoing education and training. Equipped with an understanding of projected climate-related changes and adaptation approaches and trained on how to use new decision-support tools, EPA and its partners will be better able to incorporate climate adaptation into their plans and decisions.

EPA’s training, education, and outreach programs focused on climate adaptation are evolving. EPA will develop, update, and expand the existing climate adaptation training modules for its staff and partners. The training will have two primary goals. The first is to increase awareness about the importance of climate adaptation and encourage all EPA staff and partners to consider the changing climate in the normal course of business. The second is to introduce its staff and partners to specific methods and tools for integrating climate adaptation into decision-making processes.

## 7. Agency Actions to Ensure Climate-ready Sites and Facilities

---

Climate resiliency has been an integral component of EPA’s site planning and facility support for more than a decade. In preparation for severe weather effects on its buildings, infrastructure, operations, and mission-critical activities, EPA’s Office of Mission Support (OMS) has conducted climate resiliency assessments at several key facilities in coastal, plains, and mountain regions to identify vulnerabilities and opportunities for climate readiness and adaptation. EPA will conduct additional facility climate resiliency assessments to identify new vulnerabilities and determine best practices for withstanding severe weather events, enhancing IT security, ensuring resilient power supplies, and continuing EPA’s mission-related work in the event its buildings or operations are compromised by climate change.

In addition to resiliency assessments, EPA employs a variety of management strategies to ensure its buildings are safe, resilient, and sustainable. The agency will continue to audit its facilities for safety, physical security, and sustainability opportunities such as energy reduction, water conservation, and fleet efficiency to reduce the agency’s greenhouse gas emissions and climate change impacts. EPA will also use its master planning process, which revisits facility plans every five years, to consider renovations and other projects to enhance resilience and reduce the greenhouse gas emissions associated with its operations.

Based on the results of its assessments and the efficiency measures it has reported in the Federal Energy Management Program’s Compliance Tracking System (CTS), EPA will update its master plans with projects that reinforce facilities and operations to withstand and mitigate both short- and long-term climate change impacts. Through its annual Operating Plan, EPA will identify both Buildings and Facilities (B&F) and non-B&F funding, as well as the staff resources necessary to conduct some of the following efforts, where feasible, to enhance building and operational resilience:

- Strategically relocate mechanical equipment, IT infrastructure, and other mission-critical equipment if it can be disrupted by heavy wind, rain, floods, or fires.
- Review site drainage and landscaping to prevent flooding issues from intense storms.
- Commission new buildings and review existing building envelope systems for compliance with updated codes on water and wind resistance.
- Develop drought resiliency strategies for water reuse and reduction in drought-prone areas and consider creating “clear zones” around facilities in areas with wildfire risks.
- Assess and address employee thermal comfort during extreme temperature shifts through design, while also addressing additional burdens on energy and water use during peak utility use periods.
- Harness the power of procurement to ensure that the mechanical and operational equipment for its facilities—as well as materials, furnishings, and fixtures—are resilient to and mitigate the effects of

**EPA will work to ensure that its adaptation efforts do not result in adverse impacts on already vulnerable, underserved or pollution-burdened communities. EPA will give priority to addressing the impacts of climate change in and around its facilities located in these communities.**

climate change (e.g., windows, roofing, and cladding materials used in coastal areas will be both energy-efficient and able to withstand high-level hurricane winds and floods).

A variety of agency management systems will ensure comprehensive project evaluation and coordination among key real estate, safety, security, and sustainability staff at EPA, as well as with the U.S. General Services Administration (GSA). Each project is assigned a coordination checklist, provided by EPA's Office of Administration, which is currently being updated to incorporate questions about climate resiliency and greenhouse gas mitigation. The coordination checklist supports the required National Environmental Policy Act reviews conducted on all construction projects. EPA also has a GreenCheck process in place to review design drawings, specifications, and construction plans for any new construction or major repair or renovation project; this process will ensure that climate-resilient designs, materials, and methods are incorporated throughout the building process.

OMS has already identified more than 14 large and 120 small projects to enhance EPA facility resilience, support resilient power and water supply, and ensure continuity of operations and computation in the event of severe weather events. EPA will coordinate with local utilities, fire safety officials, GSA, and other stakeholders to implement resiliency best practices and prepare contingency plans as needed.

## 8. Ensuring a Climate-ready Supply of Products and Services

---

To advance a climate-robust supply of goods and services that prioritize climate readiness and prompt innovation in materials, products, and contracting to meet mission needs, EPA has done a very general, high-level assessment of potential types of contract work that may be at risk from climate change-related events. Some examples include:

**Contracts requiring personnel performing essential work onsite.** Many EPA facilities run 24/7 with a minimum number of personnel needed to maintain operations and security, including animal care contractors who must be on site and laboratory testing contractors who must be on site to ensure samples in progress are not affected. Also, some equipment in EPA facilities need to be maintained by technical contracts involving personnel with specialized expertise, such as high-dollar-value boilers for maintaining facilities and nuclear magnetometers, which, if not properly maintained, could cease to function and even destroy the buildings where they are housed. Additionally, EPA contractors maintain emergency response and other equipment in warehouses across the country; a lack of routine maintenance or calibration of that equipment could render it ineffective.

In a climate change-related emergency event, contractor personnel may not be able or willing to come to the facility to perform the essential work, and critical supplies needed to continue their performance may be in jeopardy. Adaptation could possibly include developing an "essential worker" clause for relevant contracts and broadening the scope of acquisition planning to identify and consider alternative sources to supplement or replace reduced or unavailable contractor capabilities and capacities.

**Contracts for Superfund remediation and emergency response.** Superfund sites that are in the process of clean-up may need to be temporarily closed during a climate change-related event, requiring

contractors to secure the site from further contamination and unauthorized physical access to the site. Adaptation could include assessing the current portfolio of Superfund remediation and emergency response contracts to ensure adequate site coverage.

**Contracts for desktops, laptops, and mobile devices.** Disruption in the supply chain from increased storms and drought can compromise access to the materials and other components necessary to manufacture these goods domestically and abroad. Adaptation could possibly include increasing the variety of devices that are deemed “Agency Standard” to allow for more flexible sourcing and supply chain diversity.

**Contracts involving critical intellectual property.** Intellectual property could be rendered inaccessible due to contractor unavailability because of a climate change-driven event. Adaptation could include more extensive market research to identify alternative systems and applications to reduce reliance on custom or proprietary systems, software, and applications.

To further advance a climate-robust supply of goods and services that prioritize climate readiness and prompt innovation in materials, products, and contracting to meet mission needs, EPA will:

- Develop and implement acquisition policy to incorporate climate change considerations in the advance acquisition planning process (requirements and solicitation development for contractor response) through consideration and assessment of climate change risks and climate change innovations associated with the goods and services to be procured.
- Develop and implement a Supply Change Management Program that will include assessment of supply chain risk, with emphasis on climate change risk assessment and mitigation to ensure consistent monitoring.
- Perform an in-depth assessment of climate change supply chain risk for EPA mission critical contracts by applying the “GSA Framework for Managing Climate Risks in Federal Supply Chains” and the seven screening questions provided by the Council on Environmental Quality.

## **Conclusion: Contribution to a Healthy and Prosperous Nation**

---

The priority placed on integrating climate adaptation within EPA complements efforts to encourage and integrate climate adaptation across the entire federal government. Federal agencies now recognize that climate change poses challenges to their missions, operations, and programs. Ensuring the capacity of federal government agencies to maintain essential services and achieve their missions in the face of climate change is vital to ensuring the resilience of the entire nation. The federal government has an important and unique role in climate adaptation but is only one part of a broader effort that must include public and private partners throughout the country and internationally. Partnerships with states, tribes, territories, local communities, other governments, and international organizations are essential.

EPA’s leadership and commitment to building the nation’s adaptive capacity are vital to its mission of protecting human health and the environment. Working with its partners, EPA will help promote a healthy and prosperous nation that is more resilient to a changing climate.

**ENVIRONMENTAL PROTECTION AGENCY**

[EPA-HQ-OAR-2021-0257; FRL-9325-01-OAR]

**California State Motor Vehicle Pollution Control Standards; Advanced Clean Car Program; Reconsideration of a Previous Withdrawal of a Waiver of Preemption; Notice of Decision**

**AGENCY:** Environmental Protection Agency.

**ACTION:** Notice of decision.

**SUMMARY:** The Environmental Protection Agency (EPA) has completed the reconsideration of its 2019 action withdrawing a 2013 Clean Air Act (CAA) waiver of preemption for California's greenhouse gas (GHG) emission standards and zero emission vehicle (ZEV) sale mandate, which are part of California's Advanced Clean Car (ACC) program. This decision rescinds EPA's 2019 waiver withdrawal, thus bringing back into force the 2013 ACC program waiver, including a waiver of preemption for California's ZEV sales mandate and GHG emissions standards. In addition, EPA is withdrawing the interpretive view of CAA section 177 included in its 2019 action, that States may not adopt California's GHG standards pursuant to section 177 even if EPA has granted California a waiver for such standards. Accordingly, other States may continue to adopt and enforce California's GHG standards under section 177 so long as they meet the requirements of that section.

**DATES:** Petitions for review must be filed by May 13, 2022.

**ADDRESSES:** EPA has established a docket for this action under Docket ID EPA-HQ-OAR-2021-0257. All documents relied upon in making this decision, including those submitted to EPA by CARB, are contained in the public docket. Publicly available docket materials are available electronically through [www.regulations.gov](http://www.regulations.gov). After opening the [www.regulations.gov](http://www.regulations.gov) website, enter EPA-HQ-OAR-2021-0257 in the "Enter Keyword or ID" fill-in box to view documents in the record. Although a part of the official docket, the public docket does not include Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. EPA's Office of Transportation and Air Quality (OTAQ) maintains a web page that contains general information on its review of California waiver and authorization requests. Included on that page are links to prior waiver **Federal Register** notices, some of which are cited in this notice;

the page can be accessed at <https://www.epa.gov/state-and-local-transportation/vehicle-emissions-california-waivers-and-authorizations>.

**I. Executive Summary**

CAA section 209(a) generally preempts states from adopting emission control standards for new motor vehicles. But Congress created an important exception from preemption. Under CAA section 209(b), the State of California<sup>1</sup> may seek a waiver of preemption, and EPA must grant it unless the Agency makes one of three statutory findings. California's waiver of preemption for its motor vehicle emissions standards allows other States to adopt and enforce identical standards pursuant to CAA section 177. Since the CAA was enacted, EPA has granted California dozens of waivers of preemption, permitting California to enforce its own motor vehicle emission standards.

Of particular relevance to this action, in 2013, EPA granted California's waiver request for the state's Advanced Clean Car (ACC) program (ACC program waiver).<sup>2</sup> California's ACC program includes both a Low Emission Vehicle (LEV) program, which regulates criteria pollutants and greenhouse gas (GHG) emissions, as well as a Zero Emission Vehicle (ZEV) sales mandate. These two requirements are designed to control smog- and soot-causing pollutants and GHG emissions in a single coordinated package of requirements for passenger cars, light-duty trucks, and medium-duty passenger vehicles (as well as

<sup>1</sup> The CAA section 209(b) waiver is limited "to any State which has adopted standards . . . for the control of emissions from new motor vehicles or new motor vehicle engines prior to March 30, 1966," and California is the only State that had standards in place before that date. "California" and "California Air Resources Board" (CARB) are used interchangeably in certain instances in this notice when referring to the waiver process under section 209(b).

<sup>2</sup> 78 FR 2111 (January 9, 2013).

limited requirements related to heavy-duty vehicles). Between 2013 and 2019, twelve other States adopted one or both of California's standards as their own. But in 2019, EPA partially withdrew this waiver as part of a final action entitled "The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program" (SAFE 1), marking the first time the agency withdrew a previously granted waiver.<sup>3</sup> In addition, in the context of SAFE 1, EPA provided an interpretive view of CAA section 177 asserting that other states were precluded from adopting California's GHG standards.

As Administrator of the Environmental Protection Agency (EPA), I am now rescinding EPA's 2019 actions in SAFE 1 that partially withdrew the ACC program waiver for California's ACC program. I am rescinding these actions because (1) EPA's reconsideration of the waiver under the particular facts and circumstances of this case was improper; (2) EPA's reconsideration was based on a flawed interpretation of CAA section 209(b); (3) even under that flawed interpretation, EPA misapplied the facts and inappropriately withdrew the waiver; (4) EPA erred in looking beyond the statutory factors in CAA 209(b) to action taken by another agency under another statute to justify withdrawing the waiver; (5) that agency has also since withdrawn the action EPA relied on in any event; and (6) EPA inappropriately provided an interpretive view of section 177.

As a result of this action, EPA's 2013 waiver for the ACC program, specifically the waiver for California's GHG emission standards and ZEV sales mandate requirements for model years (MYs) 2017 through 2025, comes back into force.<sup>4</sup> I am also rescinding the interpretive view set forth in SAFE 1 that States may not adopt California's GHG standards pursuant to CAA section 177 even if EPA has granted California a section 209 waiver for such standards. Accordingly, States may now adopt and enforce California's GHG standards so long as they meet the requirements of

Section 177, and EPA will evaluate any State's request to include those provisions in a SIP through a separate notice and comment process.

Section II of this action contains a detailed history of EPA's waiver adjudications leading up to this action. In summary, in 2012, CARB submitted the ACC waiver request to EPA, which included ample evidence of the criteria pollution benefits of the GHG standards and the ZEV sales mandate. As it had in all prior waiver decisions with two exceptions (including SAFE 1), in considering the request EPA relied on its "traditional" interpretation of section 209(b)(1)(B), which examines whether California needs a separate motor vehicle program as a whole—not specific standards—to address the state's compelling and extraordinary conditions. In 2013, EPA granted California's waiver request for its ACC program in full. In 2018, however, EPA proposed to withdraw portions of its waiver granted in 2013 based on a new interpretation of section 209(b)(1)(B) that looked at whether the specific standards (the GHG standards and ZEV sales mandate), as opposed to the program as a whole, continued to meet the second and third waiver prongs (found in sections 209(b)(1)(B) and (C)).<sup>5</sup> In addition, EPA proposed to look beyond the section 209(b) criteria to consider the promulgation of a NHTSA regulation and pronouncements in SAFE 1 that declared state GHG emission standards and ZEV sales mandates preempted under EPCA. In 2019, after granting CARB a waiver for its ACC program in 2013 and after 12 states had adopted all or part of the California standards under section 177, EPA withdrew portions of the waiver for CARB's GHG emission standards and ZEV sales mandates. In SAFE 1, EPA cited changed circumstances and was based on a new interpretation of the CAA and the agency's reliance on an action by NHTSA that has now been repealed.<sup>6</sup>

<sup>5</sup> EPA's 2018 proposal was jointly issued with the National Highway Traffic Safety Administration (NHTSA), 83 FR 42986 (August 24, 2018) (the "SAFE proposal"). In addition to partially withdrawing the waiver, that proposal proposed to set less stringent greenhouse gas and CAFE standards for model years 2021–2026. NHTSA also proposed to make findings related to preemption under the Energy Policy and Conservation Act (EPCA) and its relationship to state and local GHG emission standards and ZEV sales mandates.

<sup>6</sup> 84 FR 51310. In SAFE 1, NHTSA also finalized its action related to preemption under EPCA. NHTSA's action included both regulatory text and well as pronouncements within the preamble of SAFE 1. In 2020, EPA finalized its amended and less stringent carbon dioxide standards for the 2021–2026 model years in an action titled "The Safer Affordable Fuel-Efficient (SAFE) Vehicles

On January 20, 2021, President Biden issued Executive Order 13990, directing the Federal Agencies to "immediately review" SAFE 1 and to consider action "suspending, revising, or rescinding" that action by April 2021. On April 28, 2021, EPA announced its Notice of Reconsideration, including a public hearing and an opportunity for public comment.<sup>7</sup> The Agency stated its belief that there were significant issues regarding whether SAFE 1 was a valid and appropriate exercise of Agency authority, including the amount of time that had passed since EPA's ACC program waiver decision, the approach and legal interpretations used in SAFE 1, whether EPA took proper account of the environmental conditions (*e.g.*, local climate and topography, number of motor vehicles, and local and regional air quality) in California, and the environmental consequences from the waiver withdrawal in SAFE 1. Further, EPA stated it would be addressing issues raised in the related petitions for reconsideration of EPA's SAFE 1 action. In the meantime, having reconsidered its own action, and also in response to Executive Order 13990, NHTSA repealed its conclusion that state and local laws related to fuel economy standards, including GHG standards and ZEV sales mandates, were preempted under EPCA,<sup>8</sup> and EPA revised and made more stringent the Federal GHG emission standards for light-duty vehicles for 2023 and later model years, under section 202(a).<sup>9</sup>

Section III of this action outlines the principles that govern waiver reconsiderations. It sets forth the statutory background and context for the CAA preemption of new motor vehicle emission standards, the criteria for granting a waiver of preemption, and the ability of other States to adopt and enforce California's new motor vehicle emission standards where a waiver has been issued if certain CAA criteria are met. In brief, CAA section 209(a) generally preempts all States or political subdivisions from adopting and enforcing any standard relating to the control of emissions from new motor vehicles or new motor vehicle engines. But section 209(b) contains an important exception that allows only

Rule for Model Years 2021–2026 Passenger Cars and Light Trucks" (SAFE 2). 85 FR 24174 (April 30, 2020).

<sup>7</sup> "California State Motor Vehicle Pollution Control Standards; Advanced Clean Car Program; Reconsideration of a Previous Withdrawal of a Waiver of Preemption; Opportunity for Public Hearing and Public Comment." 86 FR 22421 (April 28, 2021).

<sup>8</sup> 86 FR 74236 (December 29, 2021).

<sup>9</sup> 86 FR 74434 (December 30, 2021).

<sup>3</sup> 84 FR 51310 (September 27, 2019).

<sup>4</sup> In SAFE 1, EPA did not withdraw the entire 2013 waiver, but instead only withdrew the waiver as it related to California's GHG emission standards and the ZEV sales mandate. The waiver for the low-emission vehicle (LEV III) criteria pollutant standards in the ACC program remained in place. EPA's reconsideration of SAFE 1 and the impact on the ACC waiver therefore relates only to the GHG emission standards and the ZEV sales mandate, although "ACC program waiver" is used in this document. This action rescinds the waiver withdrawal in SAFE 1. In this decision, the Agency takes no position on any impacts this decision may have on state law matters regarding implementation.

California to submit a request to waive preemption for its standards. Importantly, EPA must grant the waiver unless the Administrator makes at least one of three findings: (1) That California's determination that its standards will be, in the aggregate, at least as protective of public health and welfare as applicable Federal standards, is arbitrary and capricious (the "first waiver prong," under section 209(b)(1)(A)); (2) that California does not need such State standards to meet compelling and extraordinary conditions (the "second waiver prong," under section 209(b)(1)(B)); or (3) that California standards are not consistent with section 202(a), which contains EPA's authority to regulate motor vehicles (the "third waiver prong," under section 209(b)(1)(C)). In the 1977 amendments to the CAA, section 177 was added to allow other States that may be facing their own air quality concerns to adopt and enforce the California new motor vehicle emission standards for which California has been granted a waiver under section 209(b) if certain criteria are met.

Section III also provides more context to indicate that Congress intended that, when reviewing a request for a waiver, EPA treat with deference the policy judgments on which California's vehicle emission standards are based. It discusses the history of Congress allowing states to adopt more stringent standards. Ultimately, Congress built a structure in section 209(b) that grants California authority to address its air quality problems, and also acknowledges the needs of other states to address their air quality problems through section 177. Lastly, Section III describes the burden and standard of proof for waiver decisions.

Section IV of this action then discusses EPA's first basis for rescinding the SAFE 1 waiver withdrawal: That EPA did not appropriately exercise its limited authority to withdraw a waiver once granted. Section 209 does not provide EPA with express authority to reconsider and withdraw a waiver previously granted to California. EPA's authority thus stems from its inherent reconsideration authority. In the context of reconsidering a waiver grant, that authority may only be exercised sparingly. EPA believes its inherent authority to reconsider a waiver decision is constrained by the three waiver criteria that must be considered before granting or denying a waiver request under section 209(b). EPA's reconsideration may not be broader than the limits Congress placed on its ability to deny a waiver in the first place. EPA notes further support for limiting its

exercise of reconsideration authority, relevant in the context of a waiver withdrawal, is evidenced by Congress's creation of a state and federal regulatory framework to drive motor vehicle emissions reduction and technology innovation that depends for its success on the stable market signal of the waiver grant—automobile manufacturers must be able to depend reliably on the continuing validity of the waiver grant in order to justify the necessary investments in cleaner vehicle technology. Accordingly, EPA now believes it may only reconsider a previously granted waiver to address a clerical or factual error or mistake, or where information shows that factual circumstances or conditions related to the waiver criteria evaluated when the waiver was granted have changed so significantly that the propriety of the waiver grant is called into doubt. Even then, as with other adjudicatory actions, when choosing to undertake such a reconsideration EPA believes it should exercise its limited authority within a reasonable timeframe and be mindful of reliance interests. EPA expects such occurrences will be rare. The Agency's waiver withdrawal in SAFE 1 was not an appropriate exercise of EPA's limited authority; there was no clerical error or factual error in the ACC program waiver, and SAFE 1 did not point to any factual circumstances or conditions related to the three waiver prongs that have changed so significantly that the propriety of the waiver grant is called into doubt. Rather, the 2019 waiver withdrawal was based on a change in EPA's statutory interpretation, an incomplete assessment of the record, and another agency's action beyond the confines of section 209(b). EPA erred in reconsidering a previously granted waiver on these bases. Accordingly, EPA is rescinding its 2019 withdrawal of its 2013 ACC program waiver.

Sections V and VI further explain why, even if SAFE 1 were an appropriate exercise of EPA's limited authority to reconsider its previously-granted waiver, the Agency would still now rescind its waiver withdrawal.

As discussed in Section V, the Agency's reinterpretation of the second waiver prong in SAFE 1 was flawed. While EPA has traditionally interpreted the second waiver prong, section 209(b)(1)(B), to require a waiver unless the Agency demonstrates that California does not need its own motor vehicle emissions program, to meet compelling and extraordinary conditions, the SAFE 1 waiver withdrawal decision was based on a statutory interpretation that calls for an examination of the need for the specific standard at issue. Section V

explains why EPA believes that its traditional interpretation is, at least, the better interpretation of the second waiver prong because it is most consistent with the statutory language and supported by the legislative history. Accordingly, we reaffirm the traditional interpretation—in which EPA reviews the need for California's motor vehicle program—in this action.

Additionally, Section V explains why even if the focus is on the specific standards, when looking at the record before it, EPA erred in SAFE 1 in concluding that California does not have a compelling need for the specific standards at issue—the GHG emission standards and ZEV sales mandate. In particular, in SAFE 1, the Agency failed to take proper account of the nature and magnitude of California's serious air quality problems, including the interrelationship between criteria and GHG pollution.<sup>10</sup> Section V further discusses EPA's improper substitution in SAFE 1 of its own policy preferences for California's, and discusses the importance of deferring to California's judgment on "ambiguous and controversial matters of public policy" that relate to the health and welfare of its citizens.<sup>11</sup> Based on a complete review of the record in this action, EPA now believes that, even under the SAFE 1 interpretation, California needs the ZEV sales mandate and GHG standards at issue to address compelling and extraordinary air quality conditions in the state. EPA's findings in SAFE 1, which were based on the Agency's inaccurate belief that these standards were either not intended to or did not result in criteria emission reductions to address California's National Ambient Air Quality Standard (NAAQS) obligations, are withdrawn.

Section VI discusses SAFE 1's other basis for withdrawing the ACC program waiver, EPCA. In SAFE 1, EPA reached beyond the waiver criteria in section 209(b)(1) and considered NHTSA's regulations in SAFE 1 that state or local regulation of carbon dioxide emission from new motor vehicles (including

<sup>10</sup> As explained herein, the requirements in the ACC program were designed to work together in terms of the technologies that would be used to both lower criteria emissions and GHG emissions. The standards, including the ZEV sales mandate and the GHG emission standards, were designed to address the short- and long-term air quality goals in California in terms of the criteria emission reductions (including upstream reductions) along GHG emission reductions. The air quality issues and pollutants addressed in the ACC program are interconnected in terms of the impacts of climate change on such local air quality concerns such as ozone exacerbation and climate effects on wildfires that affect local air quality.

<sup>11</sup> 40 FR 23102, 23104 (May 28, 1975); 58 FR 4166 (January 13, 1993).

California's ZEV sales mandate and GHG standards) are related to fuel economy and as such are preempted under EPCA. NHTSA has since issued a final rule that repeals all regulatory text and additional pronouncements regarding preemption under EPCA set forth in SAFE 1.<sup>12</sup> This action by NHTSA effectively removes the underpinning and any possible reasoned basis for EPA's withdrawal decision based on preemption under EPCA in SAFE 1. Additionally, the Agency has historically refrained from consideration of factors beyond the scope of the waiver criteria in section 209(b)(1) and the 2013 ACC program waiver decision was undertaken consistent with this practice. EPA believes that the consideration of EPCA preemption in SAFE 1 led the Agency to improperly withdraw the ACC program waiver on this non-CAA basis. EPA's explanation that withdrawal on this basis was justified because SAFE 1 was a joint action, and its announcement that this would be a single occurrence, does not justify the ACC waiver withdrawal. Thus, EPA is rescinding the withdrawal of those aspects of the ACC program waiver that were based on NHTSA's actions in SAFE 1.

Section VII addresses SAFE 1's interpretive view of section 177 that States adopting California's new motor vehicle emission standards could not adopt California's GHG standards.<sup>13</sup> EPA believes it was both unnecessary and inappropriate in a waiver proceeding to provide an interpretive view of the authority of states to adopt California standards when section 177 does not assign EPA any approval role in states' adoption of the standards. Therefore, as more fully explained in Section VII, the Agency is rescinding the interpretive view on section 177 set out in SAFE 1. Section VIII discusses certain other considerations, including the equal sovereignty doctrine and California's deemed-to-comply provision, and concludes that they do not disturb EPA's decision to rescind the 2019 waiver withdrawal action.

Section IX contains the final decision to rescind the withdrawal of the 2013 ACC program waiver. In summary, I find that although EPA has inherent authority to reconsider its prior waiver decisions, that authority to reconsider is limited and may be exercised only when EPA has made a clerical or factual error or mistake, or where information shows that factual circumstances or conditions related to the waiver criteria evaluated

when the waiver was granted have changed so significantly that the propriety of the waiver grant is called into doubt. Further, EPA's reconsideration may not be broader than the limits Congress placed on its ability to deny a waiver in the first place. Even where those conditions are met, I believe that any waiver withdrawal decision should consider other factors such as the length of time since the initial decision and California and others' reliance on the initial decision. Because there were no factual or clerical errors or such significantly changed factual circumstances or conditions necessary to trigger EPA's authority to reconsider its previously granted waiver during the SAFE 1 proceeding, I believe SAFE 1 was not an appropriate exercise of EPA's authority to reconsider. In addition, even if it were an appropriate exercise, EPA should not have departed from its traditional interpretation of the second waiver prong (section 209(b)(1)(B)), which is properly focused on California's need for a separate motor vehicle emission program—not specific standards—to meet compelling and extraordinary conditions. And even under EPA's SAFE 1 interpretation of the second waiver prong, a complete review of the factual record demonstrates that California does need the GHG emission standards and ZEV sales mandate to meet compelling and extraordinary conditions in the State. Therefore, EPA should not have withdrawn the ACC program waiver based upon the second waiver prong in SAFE 1 and rescission of the withdrawal is warranted. Additionally, I find that EPA inappropriately relied on NHTSA's finding of preemption, now withdrawn, to support its waiver withdrawal, and rescind the waiver withdrawal on that basis as well. Finally, independently in this action, I am rescinding the interpretive views of section 177 that were set forth in SAFE 1, because it was inappropriate to include those views as part of this waiver proceeding.

For these reasons, I am rescinding EPA's part of SAFE 1 related to the CAA preemption of California's standards. This rescission has the effect of bringing the ACC program waiver back into force.

## II. Background

This section provides background information needed to understand EPA's decision process in SAFE 1, and this decision. This context includes: A summary of California's ACC program including the record on the criteria pollutant benefits of its ZEV sales mandate and GHG emission standards; a review of the prior GHG emission standards waivers in order to explain

EPA's historical evaluation of the second waiver prong; an overview of the SAFE 1 decision; a review of the petitions for reconsideration filed subsequent to SAFE 1; and a description of the bases and scope of EPA's reconsideration of SAFE 1. EPA's sole purpose in soliciting public comment on its reconsideration was to determine whether SAFE 1 was a valid and appropriate exercise of the Agency's authority. In the Notice of Reconsideration, EPA therefore noted that reconsideration was limited to SAFE 1 and that the Agency was not reopening the ACC program waiver decision.

### A. California's Advanced Clean Car (ACC) Program and EPA's 2013 Waiver

On June 27, 2012, CARB notified EPA of its adoption of the ACC program regulatory package that contained amendments to its LEV III and ZEV sales mandate, and requested a waiver of preemption under section 209(b) to enforce regulations pertaining to this program.<sup>14</sup> The ACC program combined the control of smog- and soot-causing pollutants and GHG emissions into a single coordinated package of requirements for passenger cars, light-duty trucks, and medium-duty passenger vehicles (as well as limited requirements related to heavy-duty vehicles for certain model years).<sup>15</sup>

In its 2012 waiver request, CARB noted that the 2012 ZEV amendments would also result in additional criteria pollutant benefits in California in comparison to the earlier ZEV regulations and would likely provide benefits beyond those achieved by

<sup>14</sup> 2012 Waiver Request, EPA-HQ-OAR-2012-0562-0004 (2012 Waiver Request) at 1, 3–6. CARB's LEV III standards include both its criteria emission standards and its GHG emission standards. SAFE 1 did not address the LEV III criteria emission standards and as such the ACC program waiver remained in place. SAFE 1 did address CARB's GHG emission standards and ZEV sales mandate and this action addresses these two standards as well. As noted in CARB's 2012 Waiver Request, these three standards are interrelated and comprehensive in order to address the State's serious air quality problems including its criteria pollutants and climate change challenges.

<sup>15</sup> As noted in CARB's waiver request, “[a]t the December 2009 hearing, the Board adopted Resolution 09–66, reaffirming its commitment to meeting California's long term air quality and climate change reduction goals through commercialization of ZEV technologies. The Board further directed staff to consider shifting the focus of the ZEV regulation to both GHG and criteria pollutant emission reductions, commercializing ZEVs and PHEVs in order to meet the 2050 goals, and to take into consideration the new LEV fleet standards and propose revisions to the ZEV regulation accordingly.” 2012 Waiver Request at 2 (emphasis added). EPA stated in SAFE 1 that California's ZEV standard initially targeted only criteria pollutants. 84 FR at 51329. See also 78 FR at 2118.

<sup>12</sup> 86 FR 74236.

<sup>13</sup> 84 FR at 51310, 51350.

complying with the LEV III criteria pollutant standard for conventional vehicles only. CARB attributed these benefits not to vehicle emissions reductions specifically, but to increased electricity and hydrogen use that would be more than offset by decreased gasoline production and refinery emissions.<sup>16</sup> CARB's waiver request attributed the criteria emissions benefits to its LEV III criteria pollutant fleet standard and did not include similar benefits from its ZEV sales mandate. According to the request, the fleet would become cleaner regardless of the ZEV sales mandate because the ZEV sales mandate is a way to comply with the LEV III standards and, regardless of the ZEV sales mandate, manufacturers might adjust their compliance response to the standard by making less polluting conventional vehicles. CARB further explained that because upstream criteria and PM emissions are not captured in the LEV III criteria pollutant standard, net upstream emissions are reduced through the increased use of electricity and concomitant reductions in fuel production.<sup>17</sup>

On August 31, 2012, EPA issued a notice of opportunity for public hearing and written comment on CARB's request and solicited comment on all aspects of a full waiver analysis for such request under the criteria of section 209(b).<sup>18</sup> Commenters opposing the waiver asked EPA to deny the waiver under the second waiver prong, section 209(b)(1)(B), as it applied to the GHG provisions in the ACC Program, calling on EPA to adopt an alternative interpretation of that provision focusing on California's need for the specific standards. Following public notice and comment and based on its traditional interpretation of section 209(b), on January 9, 2013, EPA granted California's request for a waiver of preemption to enforce the ACC program regulations.<sup>19</sup> The traditional interpretation, which EPA stated is the better interpretation of section 209(b)(1)(B), calls for evaluating California's need for a separate motor vehicle emission program to meet compelling and extraordinary

conditions.<sup>20</sup> As explained, EPA must grant a waiver to California unless the Administrator makes at least one of the three statutorily-prescribed findings in section 209(b)(1). Concluding that opponents of the waiver did not meet their burden of proof to demonstrate that California does not have such need, EPA found that it could not deny the waiver under the second waiver prong.<sup>21</sup>

Without adopting the alternative interpretation, EPA noted that, to the extent that it was appropriate to examine the need for CARB's specific GHG standards to meet compelling and extraordinary conditions, EPA had explained at length in its earlier 2009 GHG waiver decision that California does have compelling and extraordinary conditions directly related to regulation of GHGs. This conclusion was supported by additional evidence submitted by CARB in the ACC program waiver proceeding, including reports that demonstrate record-setting wildfires, deadly heat waves, destructive storm surges, and loss of winter snowpack. Many of these extreme weather events and other conditions have the potential to dramatically affect human health and well-being.<sup>22</sup> Similarly, to the extent

<sup>20</sup> *Id.* at 2128 (“The better interpretation of the text and legislative history of this provision is that Congress did not intend this criterion to limit California’s discretion to a certain category of air pollution problems, to the exclusion of others. In this context it is important to note that air pollution problems, including local or regional air pollution problems, do not occur in isolation. Ozone and PM air pollution, traditionally seen as local or regional air pollution problems, occur in a context that to some extent can involve long range transport of this air pollution or its precursors. This long range or global aspect of ozone and PM can have an impact on local or regional levels, as part of the background in which the local or regional air pollution problem occurs.”).

<sup>21</sup> Because EPA received comment on this issue during the ACC program waiver proceeding, as it pertained to both CARB’s GHG emission standards and ZEV sales mandate, the Agency recounted the interpretive history associated with standards for both GHG emissions and criteria air pollutants to explain EPA’s belief that section 209(b)(1)(B) should be interpreted the same way for all air pollutants. *Id.* at 2125–31 (“As discussed above, EPA believes that the better interpretation of the section 209(b)(1)(B) criterion is the traditional approach of evaluating California’s need for a separate motor vehicle emission program to meet compelling and extraordinary conditions. Applying this approach with the reasoning noted above, with due deference to California, I cannot deny the waiver.”).

<sup>22</sup> *Id.* at 2126–29. Within the 2009 GHG waiver, and again in the 2013 ACC program waiver, EPA explained that the traditional approach does not make section 209(b)(1)(B) a nullity, as EPA must still determine whether California does not need its motor vehicle program to meet compelling and extraordinary conditions as discussed in the legislative history. Conditions in California may one day improve such that it may no longer have a need for its motor vehicle program.

that it was appropriate to examine the need for CARB’s ZEV sales mandate, EPA noted that the ZEV sales mandate in the ACC program enables California to meet both its air quality and climate goals into the future. EPA recognized that CARB’s coordinated strategies reflected in the ACC program for addressing both criteria pollutants and GHGs and the magnitude of the technology and energy transformation needed to meet such goals.<sup>23</sup> Therefore, EPA determined that, to the extent the second waiver prong should be interpreted to mean a need for the specific standards at issue, CARB’s GHG emission standards and ZEV sales mandate satisfy such a finding.

In the context of assessing the need for the specific ZEV sales mandate in the ACC program waiver, EPA noted CARB’s intent in the redesign of the ZEV regulation of addressing both criteria pollutants and GHG emissions, and CARB’s demonstration of “the magnitude of the technology and energy transformation needed from the transportation sector and associated energy production to meet . . . the goals set forth by California’s climate change requirements” and found that the ZEV standards would help California achieve those “long term emission benefits as well as . . . some [short-term] reduction in criteria pollutant emissions.”<sup>24</sup>

#### B. Prior Waivers for GHG Standards

For over fifty years, EPA has evaluated California’s requests for waivers of preemption under section 209(b), primarily considering CARB’s motor vehicle emission program for criteria pollutants.<sup>25</sup> More recently, the Agency has worked to determine how

<sup>23</sup> *Id.* at 2131 (“Whether or not the ZEV standards achieve additional reductions by themselves above and beyond the LEV III GHG and criteria pollutant standards, the LEV III program overall does achieve such reductions, and EPA defers to California’s policy choice of the appropriate technology path to pursue to achieve these emissions reductions. The ZEV standards are a reasonable pathway to reach the LEV III goals, in the context of California’s longer-term goals.”).

<sup>24</sup> *Id.* at 2130–31. *See also* 2012 Waiver Request at 15–16; CARB Supplemental Comments, EPA–HQ–OAR–2012–0562–0373 at 4 (submitted November 14, 2012).

<sup>25</sup> EPA notes that the 1990 amendments to the CAA added subsection (e) to section 209. Subsection (e) addresses the preemption of State or political subdivision regulation of emissions from nonroad engines or vehicles. Section 209(e)(2)(A) sets forth language similar to section 209(b) in terms of the criteria associated with EPA waiving preemption, in this instance for California nonroad vehicle and engine emission standards. Congress directed EPA to implement subsection (e). *See* 40 CFR part 1074. EPA review of CARB requests submitted under section 209(e)(2)(A)(ii) includes consideration of whether CARB needs its nonroad vehicle and engine program to meet compelling and extraordinary conditions. *See* 78 FR 58090 (September 20, 2013).

<sup>16</sup> 2012 Waiver Request at 6.

<sup>17</sup> *Id.* at 15–16.

<sup>18</sup> 77 FR 53119 (August 31, 2012).

<sup>19</sup> Set forth in the ACC program waiver decision is a summary discussion of EPA’s earlier decision to depart from its traditional interpretation of section 209(b)(1)(B) (the second waiver prong) in the 2008 waiver denial for CARB’s initial GHG standards for certain earlier model years along with EPA’s return to the traditional interpretation of the second prong in the waiver issued in 2009. 78 FR at 2125–31. These interpretations are discussed more fully in Section III.

section 209(b)(1)(B) should be interpreted and applied to GHG standards, including consideration of the relationship of GHG standards to California's historical air quality problems, the public health impacts of GHG emissions on NAAQS pollutants, and the direct impacts of GHG emissions and climate change on California and its inhabitants. While the SAFE 1 withdrawal and revocation of the waiver for CARB's ACC program represents a singular snapshot of this task, it is important to examine EPA's long-standing and consistent waiver practice in general, including EPA's interpretations in prior waiver decisions pertaining to CARB's GHG emission standards, in order to determine whether EPA properly applied the waiver criterion in section 209(b)(1)(B) in SAFE 1.<sup>26</sup>

Historically, EPA has consistently interpreted and applied the second waiver prong by considering whether California needed a separate motor vehicle emission program as compared to the specific standards at issue to meet compelling and extraordinary conditions.<sup>27</sup> At the same time, in response to commenters that have argued that EPA is required to examine the specific standards at issue in the waiver request, EPA's practice has been to nevertheless review the specific standards to determine whether California needs those individual standards to meet compelling and extraordinary conditions.<sup>28</sup> This does not mean that EPA has adopted an "alternative approach" and required a demonstration for the need for specific standards; rather, this additional Agency review has been afforded to

<sup>26</sup> EPA notes that, in the history of EPA waiver decisions, it has only denied a waiver once (in 2008) and withdrawn a waiver once (in 2019). Each instance was under this second waiver prong in section 209(b)(1)(B).

<sup>27</sup> 49 FR 18887, 18890 (May 3, 1984).

<sup>28</sup> For example, in EPA's 2009 GHG waiver that reconsidered the 2008 GHG waiver denial, the Agency noted that "Given the comments submitted, however, EPA has also considered an alternative interpretation, which would evaluate whether the program or standards has a rational relationship to contributing to amelioration of the air pollution problems in California. Even under this approach, EPA's inquiry would end there. California's policy judgment that an incremental, directional improvement will occur and is worth pursuing is entitled, in EPA's judgment, to great deference. EPA's consistent view is that it should give deference to California's policy judgments, as it has in past waiver decisions, on California's choice of mechanism used to address air pollution problems. EPA does not second-guess the wisdom or efficacy of California's standards. EPA has also considered this approach with respect to the specific GHG standards themselves, as well as California's motor vehicle emissions program." 74 FR at 32766 (citing to *Motor & Equip. Mfrs. Ass'n, Inc. v. EPA*, 627 F.2d 1095, 1110–11 (D.C. Cir. 1979)).

address commenters' concerns and this secondary analysis has been done to support the Agency's primary assessment. For example, EPA granted an authorization for CARB's In-use Off-road Diesel Standards (Fleet Requirements) that included an analysis under both approaches.<sup>29</sup> The only two departures from this traditional approach occurred first in 2008 when EPA adopted an "alternative approach" to the second waiver prong and second in 2019 when EPA adopted the "SAFE 1 interpretation" of the second waiver criterion.

EPA's task of interpreting and applying section 209(b)(1)(B) to California's GHG standards and consideration of the State's historical air quality problems that now include the public health and welfare challenge of climate change began in 2005, with CARB's waiver request for 2009 and subsequent model years' GHG emission standards. On March 6, 2008, EPA denied the waiver request based on a new interpretive finding that section 209(b) was intended for California to enforce new motor vehicle emission standards that address local or regional air pollution problems, and an Agency belief that California could not demonstrate a "need" under section 209(b)(1)(B) for standards intended to address global climate change problems. EPA also employed this new alternative interpretation to state a belief that the effects of climate change in California are not compelling and extraordinary in comparison with the rest of the country. Therefore, in the 2008 waiver denial, EPA did not evaluate whether California had a need for its motor vehicle emission program to meet compelling and extraordinary conditions (the traditional interpretation) but rather focused on the specific GHG emission standard in isolation and not in conjunction with the other motor vehicle emission standards for criteria pollutants.

In 2009, EPA initiated a reconsideration of the 2008 waiver denial. The reconsideration resulted in granting CARB a waiver for its GHG emission standards commencing in the

<sup>29</sup> 78 FR at 58090. The United States Court of Appeals for the Ninth Circuit reviewed EPA's grant of a waiver of preemption under the traditional approach, and because of comments seeking an alternative interpretation, an assessment of the need for the standards contained in California's request. *Dalton Trucking v. EPA*, No. 13–74019 (9th Cir. 2021) (finding that EPA was not arbitrary in granting the waiver of preemption under either approach). The court opinion noted that "[t]his disposition is not appropriate for publication and is not precedent except as provided by Ninth Circuit Rule 36–3."

2009 model year.<sup>30</sup> In granting the waiver, EPA rejected the Agency's alternative interpretation of the second waiver prong announced in the 2008 waiver denial. Instead, EPA returned to its traditional approach of evaluating California's need for a separate motor vehicle emission program to meet compelling and extraordinary conditions because the Agency viewed it as the better interpretation of the second waiver prong. Under the traditional interpretation, EPA found that the opponents of the waiver had not met their burden of proof to demonstrate that California did not need its motor vehicle emission program to meet compelling and extraordinary conditions. In responding to comments on this issue, EPA also determined that, even if the alternative interpretation were to be applied, the opponents of the waiver had not demonstrated that California did not need its GHG emissions standards to meet compelling and extraordinary conditions.<sup>31</sup>

Since EPA's 2009 GHG waiver decision and before SAFE 1 the Agency applied the traditional interpretation of the second waiver prong in its GHG-related waiver proceedings, including the on-going review of California's GHG emission standards for vehicles. In the first instance, in 2009, CARB adopted amendments to its certification requirements that would accept demonstration to the Federal GHG standards as compliance with CARB's GHG program. This provision is known as a "deemed-to-comply" provision.<sup>32</sup> In 2011, EPA determined that this deemed-to-comply provision was within-the-scope of the waiver issued in July 2009, relying on the traditional interpretation of the second waiver prong.<sup>33</sup> As such, in the June 14, 2011

<sup>30</sup> 74 FR 32743, 32745 (July 8, 2009).

<sup>31</sup> 74 FR at 32759–67. For example, EPA noted that the analysis of the need for CARB's GHG standards in the 2008 waiver denial failed to consider that although the factors that cause ozone are primarily local in nature and that ozone is a local or regional air pollution problem, the impacts of global climate change can nevertheless exacerbate this local air pollution problem. EPA noted that California had made a case that its greenhouse gas standards are linked to amelioration of its smog problems. *See also* 76 FR 34693 (June 14, 2011).

<sup>32</sup> California Code of Regulations, Title 13 1961(a)(1)(B). Under this provision, automakers could comply with the California GHG standards for model years 2017–2025 by meeting Federal GHG standards for the same model years.

<sup>33</sup> 76 FR 34693. EPA's "within-the-scope" decisions are generally performed when CARB has amended its regulations that were previously waived by EPA under section 209(b)(1) and include an analysis of whether EPA's prior evaluation of the waiver criteria has been undermined by CARB's amendments. EPA received comment during the

within-the-scope decision EPA determined that CARB's 2009 amendments did not affect or undermine the Agency's prior determination made in the 2009 GHG waiver decision, including the technological feasibility findings in section 209(b)(1)(C).<sup>34</sup> EPA also acted on two requests for waivers of preemption for CARB's heavy-duty (HD) tractor-trailer GHG emission standards.<sup>35</sup> Once again, EPA relied upon its traditional approach of evaluating California's need for a separate motor vehicle emission program to meet compelling and extraordinary conditions and found that no evidence had been submitted to demonstrate that California no longer needed its motor vehicle emission program to meet compelling and extraordinary conditions.<sup>36</sup> EPA's

reconsideration of SAFE 1 that questioned whether CARB needed its GHG standards if it was otherwise accepting compliance with the Federal GHG standards. EPA addressed the issue in its final decision (76 FR at 34696–98) and continues to believe EPA's analysis applies. The existence of federal emission standards that CARB may choose to harmonize with or deem as compliance with its own State standards (or that CARB may choose to set more stringent standards) does not on its own render California's as not needed. CARB continues to administer an integrated and comprehensive motor vehicle emission program (including its ZEV sales mandate and GHG emission standards and other applicable emission standards for light-duty vehicles) and this program continues to evolve to address California's serious air quality issues. CARB's decision to select some federal emission standards as sufficient to comply with its own State emission standards does not negate the overall design and purpose of section 209 of the CAA. In the within-the-scope decision issued in 2011, EPA agreed with Global Automakers comment that the deemed-to-comply provision renders emission benefits equally protective as between California and Federal programs. *Id.* at 34696.

<sup>34</sup> *Id.* at 34696–97.

<sup>35</sup> The first HD GHG emissions standard waiver related to certain new 2011 and subsequent model year tractor-trailers. 79 FR 46256 (August 7, 2014). In this waiver decision EPA responded to comments regarding whether CARB had quantified how the GHG regulations would contribute to attainment of ozone or particulate matter standards by noting that nothing in section 209(b)(1)(B) calls for California to quantify specifically how its regulations would affect attainment of the NAAQS in the State. Rather, EPA noted, the relevant question is whether California needs its own motor vehicle emission program and not whether there is a need for specific standards. The second HD GHG emissions standard waiver related to CARB's "Phase I" regulation for 2014 and subsequent model year tractor-trailers. 81 FR 95982 (December 29, 2016).

<sup>36</sup> Relatedly, California explained the need for these standards based on projected "reductions in NO<sub>x</sub> emissions of 3.1 tons per day in 2014 and one ton per day in 2020 due to the HD GHG Regulations. California state[d] that these emissions reductions will help California in its efforts to attain applicable air quality standards. California further projects that the HD GHG Regulations will reduce GHG emissions in California by approximately 0.7 million metric tons (MMT) of carbon dioxide equivalent emissions (CO<sub>2</sub>e) by 2020." 79 FR at 46261. *See also* 81 FR at 95982.

second waiver for the HD GHG emission standards made a similar finding that California's compelling and extraordinary conditions continue to exist under the traditional approach for the interpretation of the second waiver criterion.<sup>37</sup>

### C. SAFE 1 Decision

In 2018, NHTSA issued a proposal for new Corporate Average Fuel Economy (CAFE) standards that must be achieved by each manufacturer for its car and light-duty truck fleet while EPA revisited its light-duty vehicle GHG emissions standards for certain model years in the SAFE Proposal.<sup>38</sup> EPA also proposed to withdraw the waiver for the ACC program GHG emission standards and ZEV sales mandate, referencing both sections 209(b)(1)(B) and (C). EPA posited that since the grant of the initial waiver a reassessment of California's need for its GHG standards and ZEV sales mandate under the second waiver prong, section 209(b)(1)(B), was appropriate. EPA further posited that its own Federal GHG rulemaking in the SAFE proposal raised questions about the feasibility of CARB's standards under the third waiver prong, section 209(b)(1)(C).<sup>39</sup> In addition, EPA reasoned that the SAFE proposal presented a unique situation that required EPA to consider the implications of NHTSA's proposed conclusion that California's GHG emission standards and ZEV sales mandate were preempted by EPCA.<sup>40</sup>

<sup>37</sup> 81 FR at 95987. At the time of CARB's Board adoption of the HD Phase I GHG regulation, CARB determined in Resolution 13–50 that California continues to need its own motor vehicle program to meet serious ongoing air pollution problems. CARB asserted that "[t]he geographical and climatic conditions and the tremendous growth in vehicle population and use that moved Congress to authorize California to establish vehicle standards in 1967 still exist today. EPA has long confirmed CARB's judgment, on behalf of the State of California, on this matter." *See* EPA Air Docket at [regulations.gov](https://www.regulations.gov) at EPA–HQ–OAR–2016–0179–0012. In enacting the California Global Warming Solutions Act of 2006, the Legislature found and declared that "Global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California. The potential adverse impacts of global warming include the exacerbation of air quality problems, a reduction in the quality and supply of water to the state from the Sierra snowpack, a rise in sea levels resulting in the displacement of thousands of coastal businesses and residences, damage to the marine ecosystems and the natural environment, and an increase in the incidences of infectious diseases, asthma, and other health-related problems."

<sup>38</sup> The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021–2026 Passenger Cars and Light Trucks, 83 FR at 42986.

<sup>39</sup> As explained below, EPA did not make a determination regarding section 209(b)(1)(C) in SAFE 1.

<sup>40</sup> "To the extent that NHTSA has determined that these standards are void *ab initio* because EPCA

EPA thus also posited that state standards preempted under EPCA cannot be afforded a valid section 209(b) waiver and then proposed that it would be necessary to withdraw the waiver separate and apart from section 209(b)(1)(B) and (C) if NHTSA finalized its interpretation regarding preemption under EPCA.

During the SAFE 1 proceeding, EPA received additional information demonstrating that the ZEV sales mandate plays a role in reducing criteria pollution, including CARB's comments that EPA's prior findings in the ACC program waiver were correct. As noted by a number of States and Cities, "[f]or example, CARB modeled the consequences of the actions proposed in SAFE, which included withdrawing California's waiver for its GHG and ZEV standards and freezing the federal GHG standards at MY 2020 levels. CARB concluded these actions, which would eliminate California's ZEV and GHG standards and leave in place only federal GHG standards at MY 2020 levels, would increase NO<sub>x</sub> emissions in the South Coast air basin alone by 1.24 tons per day."<sup>41</sup> The SAFE 1 record also includes information that demonstrates that California is "one of the most climate challenged" regions of North America, and that it is home to some of the country's hottest and driest areas, which are particularly threatened by record-breaking heatwaves, sustained droughts, and wildfire, as a result of GHG emissions.<sup>42</sup> This record also includes information from the United States *Fourth National Climate Assessment* that documents the impact of climate change in exacerbating California's record-breaking fires seasons, multi-year drought, heat waves, and flood risk, and notes that California faces a particular threat from sea-level rise and ocean acidification and that the State has "the most valuable ocean-based economy in the country."<sup>43</sup> EPA

preempts standards that relate to fuel economy, that determination presents an independent basis for EPA to consider the validity of the initial grant of a waiver for these standards, separate and apart from EPA's analysis under the criteria that invalidate a waiver request." 84 FR at 51338.

received information during the SAFE 1 public comment period regarding the criteria emission benefits of CARB's ZEV sales mandate and GHG emission standards.<sup>44</sup>

On September 27, 2019, EPA and NHTSA published the final SAFE 1 action that promulgated preemption regulations which supported NHTSA's conclusion that EPCA preempted California's GHG standards and ZEV sales mandate. In the same action, EPA withdrew the waiver of preemption for California to enforce the ACC program GHG and ZEV sales mandate on two grounds.<sup>45</sup>

First, in SAFE 1 the Agency posited that standards preempted under EPCA could not be afforded a valid waiver of preemption under section 209(b). EPA explained that Agency pronouncements in the ACC program waiver decision on the historical practice of disregarding the preemptive effect of EPCA in the context of evaluating California's waiver applications were "inappropriately broad, to the extent it suggested that EPA is categorically forbidden from ever determining that a waiver is inappropriate due to consideration of anything other than the 'criteria' or 'prongs' at section 209(b)(1)(B)(A)–(C)."<sup>46</sup> EPA further explained that those pronouncements were made in waiver

Beach and Oakland, several international airports, many homes, and high-value infrastructure lie along the coast. In addition, much of the Sacramento–San Joaquin River Delta is near sea level. California has the most valuable ocean-based economy in the country, employing over half a million people and generating \$20 billion in wages and \$42 billion in economic production in 2014.10 Coastal wetlands buffer against storms, protect water quality, provide habitat for plants and wildlife, and supply nutrients to fisheries. Sea level rise, storm surges, ocean warming, and ocean acidification are altering the coastal shoreline and ecosystems.<sup>47</sup>

<sup>44</sup> During the current reconsideration proceeding, EPA received additional comment regarding the criteria pollution benefits of California's GHG and ZEV standards. The States and Cities at 10–11. Likewise, CARB notes this connection in comments on the SAFE proposal. Multi-State SAFE Comments, EPA–HQ–OAR–2018–0283–5481 at 24. The States and Cities provided supplemental information in response to the Notice of Reconsideration by submitting California's latest analyses of the criteria pollutant benefits of its GHG standards. For example, CARB estimated those benefits for calendar years by which the South Coast air basin must meet increasingly stringent NAAQS for ozone: 2023, 2031, and 2037. States and Cities app. A at 2–4, app. C at 8–9.

<sup>45</sup> 84 FR at 51328–29. Parties subsequently brought litigation against EPA on its SAFE 1 decision. See generally *Union of Concerned Scientists, et al. v. NHTSA, et al.*, No. 19–1230 (D.C. Cir. filed Oct. 28, 2019) (on February 8, 2021, the D.C. Circuit granted the Agencies' motion to hold the case in abeyance in light of the reconsideration of the SAFE 1 action). EPA also received three petitions for reconsideration of this waiver withdrawal.

<sup>46</sup> 84 FR at 51338.

proceedings where the Agency was acting solely on its own in contrast to a joint action with NHTSA such as SAFE 1. Additionally, EPA expressed its intention not to consider factors other than statutory criteria set out in section 209(b)(1)(A)–(C) in future waiver proceedings, explaining that addressing the preemptive effect of EPCA and its implications for EPA's waiver for California's GHG standards and ZEV sales mandate was uniquely called for in SAFE 1 because EPA and NHTSA were coordinating regulatory actions in a single notice.<sup>47</sup>

Second, EPA withdrew the waiver for the GHG standards and ZEV sales mandate under the second waiver prong, section 209(b)(1)(B), on two alternative grounds. Specifically, EPA determined first that California does not need the GHG standards "to meet compelling and extraordinary conditions," under section 209(b)(1)(B), and second, even if California does have compelling and extraordinary conditions in the context of global climate change, California does not "need" the specific GHG standards under section 209(b)(1)(B) because they will not meaningfully address global air pollution problems of the type associated with GHG emissions.<sup>48</sup> EPA also reasoned that because CARB had characterized the ZEV sales mandate as a compliance mechanism for GHG standards, both were "closely interrelated" given the overlapping compliance regimes for the ACC program, and as a result the ZEV sales mandate was inextricably interconnected with CARB's GHG standards.<sup>49</sup> In support of its overall determination that the ZEV sales mandate was not needed to meet compelling and extraordinary conditions, EPA relied on a single statement in the ACC program waiver support document where CARB did not attribute criteria emission reductions to the ZEV sales mandate, but rather noted its LEV III criteria pollutant fleet standard was responsible for those emission reductions.<sup>50</sup> Relying on this reasoning, EPA also withdrew the waiver for the ZEV sales mandate under the second waiver prong finding that California had no "need" for its own ZEV sales mandate.

In withdrawing the waiver, EPA relied on an alternative view of the scope of the Agency's analysis of California waiver requests and posited that reading "such State standards" as

<sup>47</sup> *Id.*

<sup>48</sup> *Id.* at 51341–42.

<sup>49</sup> *Id.* at 51337.

<sup>50</sup> *Id.* at 51330.

requiring EPA to only and always consider California's entire motor vehicle program would limit the application of this waiver prong in a way that EPA did not believe Congress intended.<sup>51</sup> EPA further noted that the Supreme Court had found that CAA provisions may apply differently to GHGs than they do to traditional pollutants in *UARG v. EPA*, 134 S. Ct. 2427 (2014) (partially reversing the GHG "Tailoring" Rule on grounds that the CAA section 202(a) endangerment finding for GHG emissions from motor vehicles did not compel regulation of all sources of GHG emissions under the Prevention of Significant Deterioration and Title V permit programs). EPA then interpreted section 209(b)(1)(B) as requiring a particularized, local nexus between (1) pollutant emissions from sources, (2) air pollution, and (3) resulting impact on health and welfare.<sup>52</sup> Interpreting section 209(b)(1)(C) to be limited to the specific standards under the waiver, EPA stated that "such State standards" in sections 209(b)(1)(B) and (C) should be read consistently with each other, which EPA asserted was a departure from the traditional approach where this phrase in section 209(b)(1)(B) is read as referring back to "in the aggregate" in section 209(b)(1).<sup>53</sup>

In the SAFE proposal, as an additional basis for the waiver withdrawal, EPA proposed to find that CARB's ZEV sales mandate and GHG

<sup>51</sup> In other words, EPA asserted that once it determines that California needed its very first set of submitted standards to meet extraordinary and compelling conditions, EPA would never have the discretion to determine that California did not need any subsequent standards for which it sought a successive waiver. EPA based its reading also on an assertion of ambiguity in the meaning of "such State standards" in section 209(b)(1)(B).

<sup>52</sup> *Id.* at 51339–40.

<sup>53</sup> *Id.* at 51344–45. EPA notes that this SAFE 1 position was taken despite the Agency previously stating in the ACC program waiver that "Similarly, although the Dealers might suggest that EPA only be obligated to determine whether each of CARB's ACC regulatory components, in isolation, is consistent with section 202(a) we believe the better approach is to determine the technological feasibility of each standard in the context of the entire regulatory program for the particular industry category. In this case, we believe CARB has in fact recognized the interrelated, integrated approach the industry must take in order to address the regulatory components of the ACC program. As noted above, the House Committee Report explained as part of the 1977 amendments to the Clean Air Act that California was to be afforded flexibility to adopt a complete program of motor vehicle emission controls (emphasis added). As such, EPA believes that Congress intended EPA to afford California the broadest possible discretion in selecting the best means to protect the health of its citizens and the public welfare.<sup>32</sup> EPA believes this intent extends to CARB's flexibility in designing its motor vehicle emission program and evaluating the aggregate effect of regulations within the program." 78 FR at 2217.

standards are not consistent with section 202(a) of the CAA under the third waiver prong, section 209(b)(1)(C).<sup>54</sup> However, in the final SAFE 1 action, EPA and NHTSA explained they were not finalizing the proposed assessment regarding the technological feasibility of the Federal GHG and CAFE standards for MY 2021 through 2025 in SAFE 1, and thus EPA did not finalize any determination with respect to section 209(b)(1)(C).<sup>55</sup>

In justifying the withdrawal action in SAFE 1, EPA opined that the text, structure, and context of section 209(b) supported EPA's authority to reconsider prior waiver grants. Specifically, EPA asserted that the Agency's authority to reconsider the grant of ACC program waiver was implicit in section 209(b) given that revocation of a waiver is implied in the authority to grant a waiver. The Agency noted that further support for the authority to reconsider could be found in a single sentence in the 1967 legislative history of provisions now codified in sections 209(a) and (b) and the judicial principle that agencies possess inherent authority to reconsider their decisions. According to the Senate report from the 1967 CAA amendments, the Administrator has "the right . . . to withdraw the waiver at any time [if] after notice and an opportunity for public hearing he finds that the State of California no longer complies with the conditions of the waiver."<sup>56</sup> EPA also noted that, subject to certain limitations, administrative agencies possess inherent authority to reconsider their decisions in response to changed circumstances: "It is well settled that EPA has inherent authority to reconsider, revise, or repeal past decisions to the extent permitted by law so long as the Agency provides a reasoned explanation."<sup>57</sup> This authority exists in part because EPA's interpretations of the statutes it administers "are not carved in stone."<sup>58</sup>

Finally, in SAFE 1, EPA provided an interpretive view of section 177 as not authorizing other states to adopt California's GHG standards for which EPA had granted a waiver of preemption under section 209(b). Although section 177 does not require states that adopt California's emission standards to

submit such regulations for EPA review and provides no statutory role for EPA in states' decision to adopt California's standards, EPA chose to nevertheless provide an interpretation that this provision is available only to states with approved nonattainment plans. EPA stated that nonattainment designations exist only as to criteria pollutants and GHGs are not criteria pollutants; therefore, states could not adopt GHG standards under section 177. Notably, California in previous waiver requests addressed the criteria pollutant benefits of GHG emissions reductions, specifically related to ground level ozone.

#### *D. Petitions for Reconsideration*

After issuing SAFE 1, EPA received three petitions for reconsideration urging the Agency to reconsider the waiver withdrawal of the ACC program's GHG standards and ZEV sales mandate and to rescind part or all of the SAFE 1 action.<sup>59</sup> The first Petition for Clarification/Reconsideration was submitted by the State of California and a number of States and Cities on October 9, 2019 (California Petition for Clarification).<sup>60</sup> These Petitioners sought both clarification and reconsideration of the scope of SAFE 1. Citing somewhat contradictory statements in the action, they claimed that SAFE 1 created confusion regarding which model years of the ACC program were affected by the waiver withdrawal.<sup>61</sup> They based their request for reconsideration of the withdrawal on the grounds that the SAFE 1 action relied on analyses and justifications not presented at proposal and, thus, was beyond the scope of the proposal.

A second Petition for Reconsideration was submitted by several non-governmental organizations on

November 25, 2019 (NGOs' Petition).<sup>62</sup> These Petitioners claimed that EPA's reconsideration of the ACC program waiver was not a proper exercise of agency authority because the Agency failed to consider comments submitted after the formal comment period—which they charged as inadequate—and because the EPA's rationale was a pretextual cover for the Administration's political animosity towards California and the oil industry's influence. The late comments summarized in the Petition address SAFE 1's EPCA preemption and second waiver prong arguments. On EPCA preemption, the summarized comments asserted that EPCA does not preempt GHG standards because GHG emission standards are not the "functional equivalent" of fuel economy standards, as SAFE 1 claimed. On the second waiver prong, the summarized comments asserted both that GHG and ZEV standards do have criteria pollutant benefits, and that the threat of climate change is compelling and extraordinary and will have California-specific impacts. In addition to objections to SAFE 1's EPCA preemption and second waiver prong arguments, the summarized comments asserted that ZEV standards play a key role in SIPs, which were disrupted by SAFE 1. This disruption, Petitioners claimed, violated "conformity" rules prohibiting federal actions from undermining state's air quality plans.<sup>63</sup>

A third Petition for Reconsideration was submitted by several states and cities on November 26, 2019 (States and Cities' Petition).<sup>64</sup> These Petitioners sought reconsideration of the withdrawal on the grounds that EPA failed to provide an opportunity to comment on various rationales and determinations, in particular on its authority to revoke argument, flawed re-interpretation and application of the second waiver prong, its flawed new

<sup>59</sup> The California Petition for Clarification only sought reconsideration of SAFE 1 to the extent it withdrew the ACC program waiver for model years outside those proposed. The other two petitions sought reconsideration of the full SAFE 1 action.

<sup>60</sup> EPA-OAR-2021-0257-0015.

<sup>61</sup> The California Petition for Clarification notes that, "[i]n the Final Actions, EPA makes statements that are creating confusion, and, indeed, appear contradictory, concerning the temporal scope of its action(s)—specifically, which model years are covered by the purported withdrawal of California's waiver for its GHG and ZEV standards. In some places, EPA's statements indicate that it has limited its action(s) to the model years for which it proposed to withdraw and for which it now claims to have authority to withdraw—namely model years 2021 through 2025. In other places, however, EPA's statements suggest action(s) with a broader scope—one that would include earlier model years." *Id.* at 2. In SAFE 1, EPA withdrew the waiver for California's GHG and ZEV standards for model years 2017–2025 on the basis of EPCA preemption and for model years 2021–2025 on the basis of the second waiver prong.

<sup>62</sup> EPA-HQ-OAR-2021-0257-0014. This Petition was joined by The Center for Biological Diversity, Chesapeake Bay Foundation, Environment America, Environmental Defense Fund, Environmental Law & Policy Center, Natural Resources Defense Council, Public Citizen, Inc., Sierra Club, and the Union of Concerned Scientists.

<sup>63</sup> These "late comments" can be found in the "Appendix of Exhibits" attached to the Petition for Reconsideration. These comments are considered part of EPA's record for purposes of the reconsideration of SAFE 1.

<sup>64</sup> See EPA-HQ-OAR-2021-0257-0029. This Petition was joined by the States of California, Colorado, Connecticut, Delaware, Hawaii, Illinois, Maine, Maryland, Minnesota, Nevada, New Jersey, New Mexico, New York, North Carolina, Oregon, Rhode Island, Vermont, Washington, Wisconsin, Michigan, the Commonwealths of Massachusetts, Pennsylvania, and Virginia, the District of Columbia, and the Cities of Los Angeles, New York, San Francisco, and San Jose.

<sup>54</sup> 83 FR at 43240.

<sup>55</sup> 84 FR at 51350. EPA explained that it may make a determination in connection with a future final action with regard to Federal standards. EPA's subsequent regulation to issue Federal standards did not address this issue. 85 FR 24174.

<sup>56</sup> 84 FR at 51332 (citing S. Rep. No. 90–403, at 34 (1967)).

<sup>57</sup> *Id.* at 51333.

<sup>58</sup> *Chevron U.S.A. Inc. v. NRDC, Inc.*, 467 U.S. 837, 863 (1984).

rationale for considering factors outside section 209(b) (namely, EPA preemption), and its determination that states cannot adopt California's GHG standards under section 177. For example, these Petitioners claimed they did not have an adequate opportunity to comment on EPA's use of equal sovereignty or the endangerment finding as rationales for its new "particularized nexus" interpretation of the second waiver prong. These Petitioners also claimed that EPA's statements concerning the burden of proof applicable to a waiver revocation were either unclear or inaccurate, particularly whether the Agency bears the burden of proof in withdrawing a previously granted waiver and, if not, how and why this burden of proof is different from the burden of proof for denying a waiver request.<sup>65</sup> Finally, these Petitioners asserted that the Agency failed to consider comments, submitted after the formal comment period, that challenged EPA's interpretation of the second waiver prong, including new evidence of California's need for its GHG emission standards and ZEV sales mandate, and alleged that EPA's rationale was pretextual and based on the Administration's political animosity towards California and on the oil industry's influence.

EPA notified the petitioners in the above-noted Petitions for Reconsideration that the Agency would be considering issues raised in their petitions as part of the proceeding to reconsider SAFE 1. This action addresses these petitions in the broader context of EPA's adjudicatory reconsideration of SAFE 1 commenced in response to a number of significant issues with SAFE 1.

### III. Principles Governing This Review

The CAA has been a paradigmatic example of cooperative federalism, under which "States and the Federal Government [are] partners in the struggle against air pollution."<sup>66</sup> In Title II, Congress authorized EPA to promulgate emission standards for mobile sources and generally preempted states from adopting their own standards.<sup>67</sup> At the same time, Congress

created an important exception for the State of California.

#### A. Scope of Preemption and Waiver Criteria Under the Clean Air Act

The legal framework for this decision stems from the waiver provision first adopted by Congress in 1967, and subsequent amendments. In Title II of the CAA, Congress established only two programs for control of emissions from new motor vehicles—EPA emission standards adopted under the CAA and California emission standards adopted under its state law. Congress accomplished this by preempting all state and local governments from adopting or enforcing emission standards for new motor vehicles, while at the same time providing that California could receive a waiver of preemption for its emission standards and enforcement procedures in keeping with its prior experience regulating motor vehicles and its serious air quality problems. Accordingly, section 209(a) preempts states or political subdivisions from adopting or attempting to enforce any standard relating to the control of emissions from new motor vehicles.<sup>68</sup> Under the terms of section 209(b)(1), after notice and opportunity for public hearing, EPA must waive the application of section 209(a) to California unless the Administrator finds at least one of three criteria to deny a waiver in section 209(b)(1)(A)–(C) has been met.<sup>69</sup> EPA may thus deny a waiver only if it makes at least one of these three findings based on evidence in the record, including

programs" nationwide. See *Motor & Equip. Mfrs. Ass'n, Inc. v. EPA*, 627 F.2d 1095, 1109 (D.C. Cir. 1979) (*MEMA I*).

<sup>68</sup> 42 U.S.C. 7543(a)–(a) Prohibition No State or any political subdivision thereof shall adopt or attempt to enforce any standard relating to the control of emissions from new motor vehicles or new motor vehicle engines subject to this part. No State shall require certification, inspection, or any other approval relating to the control of emissions from any new motor vehicle or new motor vehicle engine as condition precedent to the initial retail sale, titling (if any), or registration of such motor vehicle, motor vehicle engine, or equipment.

<sup>69</sup> 42 U.S.C. 7543(b)(1):

(1) The Administrator shall, after notice and opportunity for public hearing, waive application of this section to any State which has adopted standards (other than crankcase emission standards) for the control of emissions from new motor vehicles or new motor vehicle engines prior to March 30, 1966, if the State determines that the State standards will be, in the aggregate, at least as protective of public health and welfare as applicable Federal standards. No such waiver shall be granted if the Administrator finds that—

(A) the determination of the State is arbitrary and capricious,

(B) such State does not need such State standards to meet compelling and extraordinary conditions, or

(C) such State standards and accompanying enforcement procedures are not consistent with section 7521(a) of this title.

arguments that opponents of the waiver have provided. This framework struck an important balance that protected manufacturers from multiple and different state emission standards and preserved a pivotal role for California in the control of emissions from new motor vehicles. Congress intentionally structured this waiver provision to restrict and limit EPA's ability to deny a waiver and did this to ensure that California had broad discretion in selecting the means it determined best to protect the health and welfare of its citizens in recognition of both the harsh reality of California's air pollution and to allow California to serve as a pioneer and a laboratory for the nation in setting new motor vehicle emission standards and developing control technology.<sup>70</sup> Accordingly, section 209(b) specifies that EPA must grant California a waiver if California determines that its standards are, in the aggregate, at least as protective of the public health and welfare as applicable Federal standards.

EPA has consistently interpreted the waiver provision as placing the burden on the opponents of a waiver and EPA to demonstrate that one of the criteria for a denial has been met. In this context, since 1970, EPA has recognized its limited discretion in reviewing California waiver requests. For over fifty years, therefore, EPA's role upon receiving a request for waiver of preemption from California has been limited and remains only to determine whether it is appropriate to make any of the three findings specified by the CAA. If the Agency cannot make at least one of the three findings, then the waiver must be granted. The three waiver criteria are also properly seen as criteria for a denial. This reversal of the normal statutory structure embodies and is consistent with the congressional intent of providing deference to California to maintain its own new motor vehicle emission program.

The 1970 CAA Amendments strengthened EPA's authority to regulate vehicular "emission[s] of any air pollutant," while reaffirming the corresponding breadth of California's entitlement to regulate those emissions (amending CAA section 202 and recodifying the waiver provision as section 209(b), respectively). Congress also established the NAAQS program,

<sup>70</sup> See, e.g., S. Rep. No. 403, 90th Cong., 1st Sess. 33 (1967) (The waiver of preemption is for California's "unique problems and pioneering efforts."); 113 Cong. Rec. 30950, 32478 ("[T]he State will act as a testing agent for various types of controls and the country as a whole will be the beneficiary of this research.") (Statement of Sen. Murphy); *MEMA I*, 627 F.2d 1095, 1111 (D.C. Cir. 1979).

<sup>65</sup> The applicable burden of proof for a waiver withdrawal is discussed in Section III of this decision.

<sup>66</sup> *General Motors Corp. v. United States*, 496 U.S. 530, 532 (1990).

<sup>67</sup> "The regulatory difference [between Titles I and II] is explained in part by the difficulty of subjecting motor vehicles, which readily move across state boundaries, to control by individual states." *Engine Mfrs. Ass'n v. EPA*, 88 F.3d 1075, 1079 (D.C. Cir. 1996). Congress also asserted federal control in this area to avoid "the specter of an anarchic patchwork of federal and state regulatory

under which EPA issues air quality criteria and sets standards for so-called “criteria” pollutants, and states with regions that have not “attained” those federal standards must submit SIPs indicating how they plan to attain the NAAQS (which is often a multi-year, comprehensive plan). With the CAA Amendments of 1977, Congress allowed California to consider the protectiveness of its standards “in the aggregate,” rather than requiring that each standard proposed by the State be as or more stringent than its federal counterpart.<sup>71</sup> Congress also approved EPA’s interpretation of the waiver provision as providing appropriate deference to California’s policy goals and consistent with Congress’s intent “to permit California to proceed with its own regulatory program” for new motor vehicle emissions.<sup>72</sup>

In previous waiver decisions, EPA has noted that the statute specifies particular and limited grounds for rejecting a waiver and has therefore limited its review to those grounds. EPA has also noted that the structure Congress established for reviewing California’s decision-making is deliberately narrow, which further supports this approach. This has led EPA to reject arguments that are not specified in the statute as grounds for denying a waiver:

The law makes it clear that the waiver requests cannot be denied unless the specific findings designated in the statute can properly be made. The issue of whether a proposed California requirement is likely to result in only marginal improvement in air quality not commensurate with its cost or is otherwise an arguably unwise exercise of regulatory power is not legally pertinent to my decision under section 209, so long as the California requirement is consistent with section 202(a) and is more stringent than applicable Federal requirements in the sense that it may result in some further reduction in air pollution in California. Thus, my consideration of all the evidence submitted concerning a waiver decision is circumscribed by its relevance to those questions that I may consider under section 209(b).<sup>73</sup>

Given the text, legislative history, and judicial precedent, EPA has consistently interpreted section 209(b) as requiring it to grant a waiver unless opponents of a waiver can demonstrate that one of the criteria for a denial has been met.<sup>74</sup>

The 1977 CAA Amendments additionally demonstrated the significance of California’s standards to the Nation as a whole with Congress’ adoption of a new section 177. Section 177 permits other states addressing their own air pollution problems to adopt and enforce California new motor vehicle standards “for which a waiver has been granted if certain criteria are met.”<sup>75</sup> Also known as the “opt-in” provision, section 177 of the Act, 42 U.S.C. 7507, provides:

Notwithstanding section 7543(a) of this title, any State which has plan provisions approved under this part may adopt and enforce for any model year standards relating to control of emissions from new motor vehicles or new motor vehicle engines and take such other actions as are referred to in section 7543(a) of this title respecting such vehicles if—

(1) such standards are identical to the California standards for which a waiver has been granted for such model year, and

(2) California and such State adopt such standards at least two years before commencement of such model year (as determined by regulations of the Administrator).

Nothing in this section or in Subchapter II of this chapter shall be construed as authorizing any such State to prohibit or limit, directly or indirectly, the manufacture or sale of a new motor vehicle or motor vehicle engine that is certified in California as meeting California standards, or to take any action of any kind to create, or have the effect of creating, a motor vehicle or motor vehicle engine different that a motor vehicle or engine certified in California under

burden of proving otherwise is on whoever attacks them.”); *Motor & Equip. Mfrs. Ass’n, Inc. v. Nichols*, 142 F.3d 449, 462 (D.C. Cir. 1998) (*MEMA II*) (“[S]ection 209(b) sets forth the only waiver standards with which California must comply. . . . If EPA concludes that California’s standards pass this test, it is obligated to approve California’s waiver application.”).

<sup>75</sup> This provision was intended to continue the balance, carefully drawn in 1967, between states’ need to meet increasingly stringent federal air pollution limits and the burden of compliance on auto-manufacturers. See, e.g., H.R. Rep. No. 294, 95th Cong., 1st Sess. 309–10 (1977) (“[S]ection 221 of the bill broadens State authority, so that a State other than California . . . is authorized to adopt and enforce new motor vehicle emission standards which are identical to California’s standards. Here again, however, strict limits are applied . . . . This new State authority should not place an undue burden on vehicle manufacturers . . . .”); *Motor Vehicle Mfrs. Ass’n v. NYS Dep’t of Env’t Conservation*, 17 F.3d 521, 527 (2d Cir. 1994) (“Many states, including New York, are in danger of not meeting increasingly stringent federal air pollution limits . . . . It was in an effort to assist those states struggling to meet federal pollution standards that Congress, as noted earlier, directed in 1977 that other states could promulgate regulations requiring vehicles sold in their state to be in compliance with California’s emission standards or to “piggyback” onto California’s preemption exemption. This opt-in authority, set forth in § 177 of the Act, 42 U.S.C. 7507, is carefully circumscribed to avoid placing an undue burden on the automobile manufacturing industry.”).

California standards (a “third vehicle”) or otherwise create such a “third vehicle.”

Any state with qualifying SIP provisions may exercise this option and become a “Section 177 State,” without first seeking the approval from EPA.<sup>76</sup> Thus, over time, Congress has recognized the important state role, for example, by making it easier (by allowing California to consider its standards “in the aggregate”) and by expanding the opportunity (via section 177) for states to adopt standards different from EPA’s standards.<sup>77</sup>

#### B. Deference to California

EPA has consistently noted that the text, structure, and history of the California waiver provision clearly indicate both congressional intent and appropriate EPA practice of leaving the decision on “ambiguous and controversial matters of public policy” to California’s judgment. In waiver decisions, EPA has thus recognized that congressional intent in creating a limited review of California waiver requests based on the section 209(b)(1) criteria was to ensure that the federal government did not second-guess the wisdom of state policy. In an early waiver decision EPA highlighted this deference:

It is worth noting \* \* \* I would feel constrained to approve a California approach to the problem which I might also feel unable to adopt at the federal level in my own capacity as a regulator. The whole approach of the Clean Air Act is to force the development of new types of emission

<sup>76</sup> In 1990 Congress amended the CAA by adding section 209(e) to section 209. Section 209(e) sets forth the terms of CAA preemption for nonroad engines and vehicles and the ability of States to adopt California emissions standards for such vehicles and engines if certain criteria are met. 42 U.S.C. 7543(e)(2)(B) (“Any State other than California which has plan provisions approved under part D of subchapter I may adopt and enforce, after notice to the Administrator, for any period, standards relating to control of emissions from nonroad vehicles or engines . . . if (i) such standards and implementation and enforcement are identical, for the period concerned, to the California standards . . . .”). Courts have interpreted these amendments as reinforcing the important role Congress assigned to California. See *Engine Mfrs. Ass’n v. EPA*, 88 F.3d 1075, 1090 (“Given the indications before Congress that California’s regulatory proposals for nonroad sources were ahead of the EPA’s development of its own proposals and the Congressional history of permitting California to enjoy coordinated regulatory authority over mobile sources with the EPA, the decision to identify California as the lead state is comprehensible. California has served for almost 30 years as a ‘laboratory’ for motor vehicle regulation.”); *MEMA I*, 627 F.2d 1095, 1110 (D.C. Cir. 1979) (“Its severe air pollution problems, diverse industrial and agricultural base, and variety of climatic and geographical conditions suit it well for a similar role with respect to nonroad sources.”).

<sup>77</sup> 40 FR at 23104; see also LEV I waiver at 58 FR 4166, Decision Document at 64.

<sup>71</sup> 42 U.S.C. 7543(b)(1).

<sup>72</sup> H.R. Rep. No. 95–294, at 301 (1977).

<sup>73</sup> 78 FR at 2115 (footnote omitted).

<sup>74</sup> *MEMA I*, 627 F.2d at 1120–21 (“The language of the statute and its legislative history indicate that California’s regulations, and California’s determination that they comply with the statute, when presented to the Administrator are presumed to satisfy the waiver requirements and that the

control technology where that is needed by compelling the industry to “catch up” to some degree with newly promulgated standards. Such an approach \* \* \* may be attended with costs, in the shape of reduced product offering, or price or fuel economy penalties, and by risks that a wider number of vehicle classes may not be able to complete their development work in time. Since a balancing of these risks and costs against the potential benefits from reduced emissions is a central policy decision for any regulatory agency under the statutory scheme outlined above, I believe I am required to give very substantial deference to California’s judgments on this score.<sup>78</sup>

As noted above, Congress amended the CAA in 1977. Within these amendments, Congress had the opportunity to reexamine the waiver provision and elected to expand California’s flexibility to adopt a complete program of motor vehicle emission controls. The House Committee Report explained that “[t]he amendment is intended to ratify and strengthen the California waiver provision and to affirm the underlying intent of that provision, *i.e.*, to afford California the broadest possible discretion in selecting the best means to protect the health of its citizens and the public welfare.”<sup>79</sup>

SAFE 1 was a departure from congressional intent and EPA’s typical practice of deference to California on matters of state public policy regarding how best to address its serious air quality problems. In SAFE 1, EPA adopted a new interpretation of section 209(b)(1)(B) more than five years after the initial grant of the ACC program waiver and applied it to CARB’s GHG standards and ZEV sales mandate. Specifically, EPA premised its finding on a consideration of California’s “need” for the specific standards, instead of the “need” for a separate motor vehicle emission program to meet compelling and extraordinary conditions, stating that “such State standards” in section 209(b)(1)(B) was ambiguous with respect to the scope of the Agency’s analysis. EPA further determined that California did not need the ZEV sales mandate to meet compelling and extraordinary conditions by relying on a single statement in the ACC program waiver support document taken out of context, where it noted that the ZEV sales

mandate had no criteria emissions benefits in terms of vehicle emissions and its LEV III criteria pollutant fleet standard was responsible for those emission reductions. In response to the SAFE 1 proposal, California had provided further context and additional data on net upstream emissions benefits of the ZEV sales mandate, but EPA did not consider them in arriving at the findings and conclusions in SAFE 1. The final decision in SAFE 1 was not based on the third waiver prong.<sup>80</sup> EPA also explained in SAFE 1 that the task of interpreting section 209(b)(1)(B) required no deference to California.<sup>81</sup>

### C. Standard and Burden of Proof

In *Motor and Equipment Manufacturers’ Association v. EPA*, 627 F.2d 1095 (D.C. Cir. 1979) (*MEMA I*), the U.S. Court of Appeals for the District of Columbia stated, with regard to the standard and burden of proof, that the Administrator’s role in a section 209 proceeding is to “consider all evidence that passes the threshold test of materiality and . . . thereafter assess such material evidence against a standard of proof to determine whether the parties favoring a denial of the waiver have shown that the factual circumstances exist in which Congress intended a denial of the waiver.”<sup>82</sup> The court in *MEMA I* considered the standards of proof under section 209 for the two findings necessary to grant a waiver for an “accompanying enforcement procedure” (as opposed to the standards themselves): (1) Protectiveness in the aggregate and (2) consistency with CAA section 202(a) findings. The court instructed that “the standard of proof must take account of the nature of the risk of error involved in any given decision, and it therefore varies with the finding involved. We need not decide how this standard operates in every waiver decision.”<sup>83</sup> The court upheld the Administrator’s position that to deny a waiver, there must be clear and compelling evidence to show that the proposed procedures undermine the protectiveness of California’s standards. The court noted that this standard of proof also accords with the congressional intent to provide California with the broadest possible discretion in setting regulations it finds protective of the public health and

welfare.<sup>84</sup> With respect to the consistency finding, the court did not articulate a standard of proof applicable to all proceedings but found that the opponents of the waiver were unable to meet their burden of proof even if the standard were a mere preponderance of the evidence.

Although *MEMA I* did not explicitly consider the standards of proof under section 209 concerning a waiver request for “standards,” as compared to accompanying enforcement procedures, there is nothing in the opinion to suggest that the court’s analysis would not apply with equal force to such determinations. EPA’s past waiver decisions have consistently made clear that: “[E]ven in the two areas concededly reserved for Federal judgment by this legislation—the existence of compelling and extraordinary conditions and whether the standards are technologically feasible—Congress intended that the standard of EPA review of the State decision to be a narrow one.”<sup>85</sup> Although EPA evaluates whether there are compelling and extraordinary conditions in California, the Agency nevertheless accords deference to California on its choices for how best to address such conditions in light of the legislative history of section 209(b).

As noted earlier, the burden of proof in a waiver proceeding is on EPA and the opponents of the waiver. This is clear from the statutory language stating that EPA “shall . . . waive” preemption unless one of three statutory factors is met. This reading was upheld by the D.C. Circuit in *MEMA I*, which concluded that this obligation rests firmly with opponents of the waiver in a section 209 proceeding, holding that: “[t]he language of the statute and its legislative history indicate that California’s regulations, and California’s determinations that they must comply with the statute, when presented to the Administrator are presumed to satisfy the waiver requirements and that the burden of proving otherwise is on whoever attacks them. California must present its regulations and findings at

<sup>84</sup> *Id.*

<sup>85</sup> *See, e.g.*, 40 FR at 23102–03. *See also MEMA I*, 627 F.2d at 1109 (“Congress had an opportunity to restrict the waiver provision in making the 1977 amendments, and it instead elected to expand California’s flexibility to adopt a complete program of motor vehicle emissions control. Under the 1977 amendments, California need only determine that its standards will be ‘in the aggregate, at least as protective of public health and welfare than applicable Federal standards,’ rather than the ‘more stringent’ standard contained in the 1967 Act.”) (citing H.R. Rep. No. 294, 95th Cong., 1st Sess. 301–02 (1977), U.S. Code Cong. & Admin. News 1977, p. 1380).

<sup>78</sup> 40 FR at 23104.

<sup>79</sup> *MEMA I*, 627 F.2d at 1110 (citing H.R. Rep. No. 294, 95th Cong., 1st Sess. 301–02 (1977)). Congress amended section 209(b)(1)(A) regarding California’s determination that its standards are as at least as protective as applicable Federal standards so that such determination may be done “in the aggregate” looking at the summation of the standards within the vehicle program.

<sup>80</sup> 84 FR at 51322–33. EPA notes that when reviewing California’s standards under the third waiver prong, the Agency may grant a waiver to California for standards that EPA may choose not to adopt at the federal level due to different considerations. *See* 78 FR at 2133.

<sup>81</sup> 84 FR at 51339–40.

<sup>82</sup> *MEMA I*, 627 F.2d at 1122.

<sup>83</sup> *Id.*

the hearing and thereafter the parties opposing the waiver request bear the burden of persuading the Administrator that the waiver request should be denied.”<sup>86</sup>

The Administrator’s burden, on the other hand, is to make a reasonable evaluation of the information in the record in coming to the waiver decision. As the court in *MEMA I* stated, “Here, too, if the Administrator ignores evidence demonstrating that the waiver should not be granted, or if he seeks to overcome that evidence with unsupported assumptions of his own, he runs the risk of having his waiver decision set aside as ‘arbitrary and capricious.’”<sup>87</sup> Therefore, the Administrator’s burden is to act “reasonably.”<sup>88</sup>

In this instance, EPA has withdrawn a previously granted waiver and is now reconsidering whether that withdrawal was an appropriate exercise of authority, whether the reinterpretation of the second waiver prong was appropriate, and whether EPA’s evaluation and findings of fact under the second waiver prong meet the applicable burden of proof in the context of deference to California’s policy choices. EPA believes that the same burden that is applicable to those opposed to an initial waiver request from CARB (this applies to any party including the Administrator as explained in *MEMA I*) is also applicable to EPA’s actions in SAFE 1 (e.g., the burden of proof of whether California does not need its standards to meet compelling and extraordinary conditions rests on those opposing a waiver for California).<sup>89</sup>

<sup>86</sup> *MEMA I*, 627 F.2d at 1121.

<sup>87</sup> *Id.* at 1126.

<sup>88</sup> *Id.*

<sup>89</sup> In EPA’s 2009 evaluation of the 2008 GHG waiver denial the Agency applied a similar test. See 74 FR at 32745 (“After a thorough evaluation of the record, I am withdrawing EPA’s March 6, 2008 Denial and have determined that the most appropriate action in response to California’s greenhouse gas waiver request is to grant that request. I have determined that the waiver opponents have not met their burden of proof in order for me to deny the waiver under any of the three criteria in section 209(b)(1).”). In the context of 2009 GHG waiver that reconsidered the Agency’s 2008 GHG waiver denial, EPA determined it was appropriate to apply the same burden of proof during the reconsideration as would apply at the time of the initial waiver evaluation. EPA received comment suggesting that the entire burden of proof shifts to California in order for the prior 2008 denial to be reversed. EPA, in response, stated that “. . . regardless of the previous waiver denial, once California makes its protectiveness determination the burden of proof falls on the opponents of the waiver. . . . This is consistent with the legislative history, which indicates that Congress intended a narrow review by EPA and to preserve the broadest possible discretion for California.” *Id.* at 32749. EPA acknowledges that in SAFE 1 the Agency not

#### IV. EPA Did Not Appropriately Exercise Its Limited Authority To Reconsider the ACC Program Waiver in SAFE 1

The first question this final action tackles is whether the agency properly exercised its reconsideration authority to withdraw its previously-granted waiver in SAFE 1. EPA concludes that it did not, and on that independent basis rescinds SAFE 1’s waiver withdrawal.

Section 209 does not provide EPA with express authority to reconsider and withdraw a waiver previously granted to California. EPA’s authority thus stems from its inherent reconsideration authority. For several reasons, in the context of reconsidering a waiver grant, that authority may only be exercised sparingly. First, EPA believes its inherent authority to reconsider a waiver decision is constrained by the three waiver criteria that must be considered before granting or denying a waiver request under section 209(b). A contrary approach, which treats reconsiderations as more broadly appropriate, would undermine Congress’ intent that California be able to exercise its policy judgments and develop motor vehicle controls programs to address California’s air pollution problems, and make advances which could be built on by EPA or adopted by other states. Second, EPA believes it may only reconsider a previously granted waiver to address a clerical or factual error or mistake, or where information shows that factual circumstances or conditions related to the waiver criteria evaluated when the waiver was granted have changed so significantly that the propriety of the waiver grant is called into doubt. Even when EPA is acting within the appropriate bounds of its authority to reconsider, during that reconsideration EPA should exercise its limited

only adopted an interpretation of the second waiver prong which was similar to the previously rejected interpretation, but that in doing so also questioned its previous position that the burden of proof in evaluating the need for standards at issue resides with those that oppose the waiver, including EPA. See 84 FR at 51344 n.268. In this action, however, EPA now finds that the historical deference provided to California regarding its policy choices on how best to address its serious air quality conditions also requires that the burden of proof should reside in those seeking to demonstrate that standards are not needed under the second waiver prong regardless of whether the rationale is characterized as a new interpretation or not. The language of section 209(b)(1) requires California to make a protectiveness finding under the first waiver prong. Moreover, nothing in section 209(b) could be read as support for drawing a distinction between the burden of proof when the Agency considers an initial waiver request and one where the Agency reconsiders a waiver decision based on a new interpretation of the statutory criteria. That burden properly resides with opponents of the waiver.

authority within a reasonable timeframe and be mindful of reliance interests.

The Agency’s reconsideration in SAFE 1 was not an appropriate exercise of authority; there was no clerical error or factual error in the ACC program waiver, and SAFE 1 did not point to any factual circumstances or conditions related to the three waiver prongs that had changed so significantly that the propriety of the waiver grant is called into doubt. Rather, the 2019 waiver withdrawal was based on a change in EPA’s statutory interpretation, an incomplete and inaccurate assessment of the record, and another agency’s action beyond the confines of section 209(b). EPA erred in reconsidering a previously granted waiver on these bases. Moreover, in considering the passage of time between the initial waiver and the SAFE 1 action, and the development of reliance interests based on the waiver, EPA finds those factors do not support the reconsideration of the ACC program waiver that occurred in SAFE 1. Accordingly, as explained in detail below, EPA is rescinding SAFE 1’s withdrawal of its 2013 ACC program waiver because it was an inappropriate exercise of reconsideration authority.

#### A. Comments Received

EPA received several comments in the reconsideration proceeding on the Agency’s authority to reconsider waivers. Comments on explicit authority focused on whether any language in section 209(b)(1), on its face, permits EPA to reconsider a previously granted waiver. Some of these commenters also distinguished between the denial of the 2008 waiver and the reconsideration and grant of the GHG waiver in 2009, and EPA’s grant of the ACC program waiver in 2013 and the reconsideration and withdrawal of the ACC program waiver in 2019.

EPA received comments in support of and against the view that EPA has inherent authority to reconsider waivers. As support for EPA’s implied authority to reconsider, one commenter cited relevant language from the Senate Committee Report from 1967 that stated, “implicit in [§ 209] is the right of [EPA] to withdraw the waiver [if] at any time after notice and an opportunity for public hearing he finds that the State of California no longer complies with the conditions of that waiver.”<sup>90</sup> According to the commenter because “the waiver authorizes future regulation, which always remains open to change,” EPA must have the authority to reconsider a

<sup>90</sup> Urban Air Initiative (Urban Air), Docket No. EPA-HQ-OAR-2021-0257-0223 at 22 (quoting S. Rep. 90-403, at 34 (1967)).

waiver. Otherwise, EPA would be unable to monitor CARB's continued compliance with the waiver conditions in light of updated information.<sup>91</sup> The same commenter also argued that an agency generally retains the authority to reconsider and correct any earlier decision unless Congress acts to displace the authority with a process to rectify the Agency's mistakes and that explicit statutory authority to withdraw a waiver is therefore not necessary, because "the power to reconsider is inherent in the power to decide."<sup>92</sup> The commenter claimed that, under *Chevron*, "[a]n agency has a 'continuing' statutory obligation to consider the 'wisdom of its policy.'" <sup>93</sup>

In contrast, several commenters maintained that section 209(b) strongly indicates that EPA's authority to withdraw a previously issued waiver is, at most, limited. Several commenters argued that, absent language in a statute, administrative agencies lack inherent authority to reconsider adjudicatory decisions.<sup>94</sup> These commenters noted that courts highly scrutinize administrative revocations and are "unwilling[] to wrest a standardless and open-ended revocation authority from a silent statute."<sup>95</sup> Instead, these commenters argued, EPA may act only with the authorities conferred upon it by Congress, and thus the Agency may only act if the CAA explicitly or

implicitly grants it power to do so.<sup>96</sup> According to these commenters, section 209(b) is silent on waiver withdrawal, its text indicates that EPA may only consider 209(b)'s three factors before either granting or denying a waiver, and its purpose and structure affords broad deference to California's standards. "Taken together, these factors indicate that EPA may not withdraw a previously-issued waiver based solely upon a reconsideration of its initial judgment."<sup>97</sup> Commenters suggested that Congress, by listing the three waiver criteria and directing that EPA evaluate such criteria prior to granting the waiver, only authorized EPA to perform the evaluation once and that it "cannot later second-guess the wisdom of legal and policy judgments made as part of that evaluation."<sup>98</sup> Similarly, commenters noted that section 209 does not textually "provide" EPA any authority nor specify any process by which EPA might revoke the rights given by an earlier-granted waiver.<sup>99</sup> In response to SAFE 1's claim of inherent

reconsideration authority and the other commenters' reliance on the relevant excerpt from the 1967 Senate Report, these commenters argued that this "single sentence . . . does not establish any withdrawal authority," either generally or for the SAFE 1 withdrawal specifically.<sup>100</sup> That statement, commenters argued, "predate[s] the creation of the NAAQS program and Congress's invitations to development of numerous state reliance interests."<sup>101</sup> Moreover, according to these commenters, the statement only discusses authority in the case that "California no longer complies with the conditions of the waiver," which commenters believe means California's "compliance with waiver conditions and, specifically, its cooperation with EPA concerning enforcement and certification procedures," not "redefined waiver criteria."<sup>102</sup>

In response to the argument made by EPA in SAFE 1 that, given the "considerable degree of future prediction" required by the third waiver prong, "where circumstances arise that suggest that such predictions may have been inaccurate, it necessarily follows that EPA has authority to revisit those predictions,"<sup>103</sup> some commenters claimed that California's standards do not become inconsistent with federal standards simply because they become more stringent than federal standards (in other words, a weakening of the federal standards does not necessarily create an inconsistency). The commenters noted also that EPA did not in fact revise its section 202(a) standards between issuing and withdrawing the waiver at issue, nor did EPA in fact make any final findings under the third waiver prong.<sup>104</sup>

Many commenters stated that in order to exercise any implied or inherent authority, an agency must provide a "detailed justification" when departing from a policy that has "engendered serious reliance interests" and should not "rest on mere 'policy changes'"

<sup>91</sup> *Id.* at 21 ("A determination that California's state standards are technologically feasible and appropriate requires complex technical projections at the frontiers of science, which must be continually updated 'if the actual future course of technology diverges from expectation.'" (quoting *NRDC Inc. v. EPA*, 655 F.2d 318, 329 (D.C. Cir. 1981))).

<sup>92</sup> *Urban Air* at 20 (citing *Ivy Sports Med., LLC v. Burwell*, 767 F.3d 81, 86, 93 (D.C. Cir. 2014)). This commenter also notes that, in EPA's 2009 action to reconsider its prior denial of a GHG waiver in 2008, CARB submitted a letter to EPA stating that "California believes EPA has inherent authority to reconsider the denial and should do so in order to restore the interpretations and applications of the Clean Air Act to continue California's longstanding leadership role in setting emission standards." *Id.*

This language charges EPA "with undertaking a single review in which [the Administrator] applies the deferential standards set forth in Section 209(b) to California and either grants or denies a waiver." *Ford Motor Co. v. EPA*, 606 F.2d 1293, 1302 (D.C. Cir. 1979). It evinces no intent to provide EPA with the different and greater authority to withdraw a previously granted waiver, thereby arresting the State's ongoing implementation of its own laws.")

<sup>99</sup> See South Coast Air Quality Management District (SCAQMD), Docket No. EPA-HQ-OAR-2021-0257-0228 at 3. This commenter argued that section 116 of the CAA (which explicitly references section 209) provides that there needs to be a textual basis for any exercise of authority to deny California the right (which it achieved via the 2013 waiver) to enforce its emission standards. Thus, the commenter continued, because there is no language in section 209 that gives any authority nor specifies any process for EPA to revoke the rights/waiver previously granted then EPA may not do so by the terms of section 116.

<sup>102</sup> Twelve Public Interest Organizations app. 1 at 34. See also States and Cities at 16 (arguing that, although EPA proposed to withdraw the waiver on multiple grounds, such as the third waiver prong, "EPA's final action was based entirely on its own changed policy positions, namely its interpretation of Section 209(b)(1) to create a categorical bar against state regulation of vehicular GHG emissions and its decision to rely on another agency's newly articulated views of a different statute [EPCA].").

<sup>103</sup> 84 FR at 51332.

<sup>104</sup> Institute for Policy Integrity at 2.

alone.<sup>105</sup> Thus, supporters and opponents of SAFE 1 also provided comments on whether, assuming EPA did have authority to reconsider the ACC program waiver—either because of language in the CAA or because of its inherent authority to reevaluate decisions because of changed conditions—it was appropriate to exercise that authority in SAFE 1. Some commenters summarized precedent as requiring that the Agency consider reliance interests that have attached to its original decision, that reversals of informal adjudications occur within a reasonable time after the original decision, and that the reversal is not for the sole purpose of applying some change in administrative policy.<sup>106</sup> Opponents and supporters of SAFE 1 did, however, disagree on the significance of each of these factors.<sup>107</sup>

Commenters who argued that reliance interests were relevant to EPA's authority to reconsider also offered evidence of reliance interests that had accrued over the five years the ACC program waiver had been in effect, with several commenters providing specific details regarding their reliance on the GHG and ZEV standards. As commenters noted, California's standards are incorporated into plans and regulations aimed at achieving state and federal air pollution goals. These plans can be complex and cannot "change on a dime."<sup>108</sup> According to one commenter "[w]ithout the full Waiver, past decision-making was blighted and planned-for reductions to meet Air District goals need to be reassessed. The emission reductions are

<sup>115</sup> See Ford Motor Company (Ford), Docket No. EPA–HQ–OAR–2021–0257–0028 at 1 ("Ford supports EPA's rescission of its SAFE 1 action, which withdrew California's waiver for zero emission vehicle (ZEV) mandate and greenhouse gas (GHG) emission standards within California's Advanced Clean Car (ACC) program. Ford does not believe this previous action was appropriate. Ford firmly supports recognition of California's authority to implement ZEV and GHG standards in support of its air quality targets pursuant to its 2012 waiver application. We have relied on California's actions pursuant to the waiver and California's related pronouncements in negotiating and agreeing to the California Framework Agreement, and in the development of our own product and compliance plans. Ultimately, Ford considered EPA's and NHTSA's rationales and California's statements regarding SAFE 1 and took action in the best interests of the company and of the environment."). See also Tesla, Docket No. EPA–HQ–OAR–2021–0257–0136 at 4 ("Because of the sizeable investments required to develop alternative fuel and advanced technology vehicles, regulatory stability is vital for ensuring the level of manufacturer and investor confidence necessary to facilitate innovation.") and at n.5 (quoting comments from several automakers and auto industry groups about reliance interests on the waiver from the MTE). See also Toyota, Docket No. EPA–HQ–OAR–2021–0381 ("Should EPA reinstate California's waiver, we request it be reinstated as it was originally granted, including the "deemed-to-comply" provision that was so important in establishing One National Program (ONP) over a decade ago. . . . Reinstatement of California's waiver for model years 2021 and 2022 poses significant lead time challenges considering that 2021 model year is well underway, and 2022 model year vehicles are generally already designed, sourced, certified to various regulatory requirements, and ready to begin production. Some manufacturers may have already begun production of 2022 model year vehicles. As a result, a reinstatement of California's waiver by EPA should apply prospectively to model years 2023 and later.").

Transportation, an industry coalition group, stated “NCAT members have invested billions of dollars with the well-founded expectation that increased demand for electric vehicles would be propelled by California and the section 177 States’ continued ability to drive technology innovation and emission reductions.”<sup>116</sup> EPA also received comment from CARB, by and through the comments of the States and Cities, that provided data on manufacturer compliance.<sup>117</sup>

According to commenters, these reliance interests were compounded by the considerable passage of time between the granting of the ACC program waiver in 2013 and SAFE 1’s withdrawal in 2019. Commenters also remarked that the more than five years that had passed was too long a delay and well beyond the “weeks, not years” sometimes referenced as guidance for reasonableness.<sup>118</sup> SAFE 1, they noted “comes years after the waiver was granted, years after multiple sovereign States adopted California’s standards, and years into long-term plans States developed in reliance on anticipated emission reductions from those standards—including, but not limited to, multiple EPA approved State Implementation Plans.”<sup>119</sup>

Other commenters argued that SAFE 1 did not upend reliance interests and was not untimely. They agreed with the SAFE 1 decision that the 2018 Mid-Term Evaluation (MTE), which was agreed to in 2013, prevented any reliance interests from accruing.<sup>120</sup> Although this MTE was for the federal GHG standards for MYs 2022–2025, not the California GHG standards approved under the ACC program waiver, these commenters argued that the two were linked through the “deemed to comply”

provision approved in the ACC program waiver, which allowed manufacturers to comply with the California standards by meeting the federal standards.<sup>121</sup> They also noted that California separately agreed to a 2016 mid-term evaluation of its own state standards for the same model years.<sup>122</sup> Therefore, they argued, because the initial grant of the waiver was contingent on two subsequent mid-term evaluations, no one could have reasonably believed the ACC program waiver was “set in stone.” Additionally, at least one commenter argued that California and other states’ purported reliance interests were further undermined because they “have known for years that NHTSA’s longstanding position is that state carbon dioxide regulations and zero-emissions vehicle mandates are related to average fuel economy standards and therefore preempted by CAFE” and “could not have reasonably believed that EPA would continue to ignore NHTSA’s view of the law in perpetuity.”<sup>123</sup>

Some commenters also argued that even if reliance interests are relevant, automakers and industry groups have reliance interests of their own affected by CARB’s 2018 deemed to comply amendments and the SAFE 1 action itself. One commenter wrote that “CARB tossed automakers’ reliance interests out the window when it refused to be bound by the results of the EPA and NHTSA’s Mid-Term Evaluation (MTE) . . . and refused to honor its ‘deemed to comply’ pledge to automakers unless they complied with the standards set by the EPA in 2012 and 2017.”<sup>124</sup> Another commenter noted that “[w]hatever ‘reliance interests’ are disturbed when EPA reverses a waiver grant are no more real, and no more serious for the parties involved, than the reliance interests upended by reversal of a waiver denial.”<sup>125</sup>

Some commenters also argued that SAFE 1 was timely, disputing opponents’ claims that a “reasonable” amount of time is measured in “weeks, not years.” Commenters noted that “courts have not reached consensus on the amount of time that is reasonable.”<sup>126</sup> Moreover, one commenter argued that “timeliness depends on reliance interests” and, because those could not have accrued prior to the MTE, the time period at issue is only four months (between the conclusion of the MTE and the reconsideration of the ACC program waiver, starting in 2018).<sup>127</sup> This “short time,” the commenter claimed, “lies in the acceptable range given the intervening events.”<sup>128</sup> Another commenter argued that, if “time elapsed” is a factor to be considered in the appropriateness of an action, it cuts in favor of SAFE 1, as thirty years passed between EPCA’s enactment in 1975 and California’s first request for a “waiver implicitly authorizing the State to regulate fuel economy.”<sup>129</sup> Even if the time period at issue was nearly six years between the grant of the ACC program and the final SAFE 1 action, that commenter wrote, such a length of time is not unreasonable, since “[i]f six years locks a policy in place and puts it beyond revision or repeal by the next administration, elections no longer matter.”<sup>130</sup>

In addition to reliance interests and timeliness, some commenters claimed that EPA’s authority to revoke, if it existed, requires the Agency to have a purpose other than “applying some . . . change in administrative policy.”<sup>131</sup> SAFE 1, they argued, did not meet this requirement. Instead, in SAFE 1, EPA “chose to *sua sponte* reconsider its 2013 Waiver Grant for the sole purpose of applying new policy determinations,” specifically “NHTSA’s views of EPCA preemption” and “new interpretations

decision,’ the grant of a waiver is as liable to change as the denial of a waiver. No greater reliance interests attach to the grant of a waiver authorizing regulation than to the denial of a waiver preventing regulation, so reliance interests provide no support for California’s ratchet argument.”)

<sup>126</sup> Urban Air at 23–24.

<sup>127</sup> *Id.* at 24. Another commenter disagreed with this accounting of time, stating that “timeliness for reconsidering an adjudication is measured from the date of the agency’s decision, not from the date of activity resulting from that decision. *E.g., Am. Methyl*, 749 F.2d at 835 (tethering timeliness to period for appeal of agency decision).” Twelve Public Interest Organizations app. 1 at 38.

<sup>120</sup> America Fuel & Petrochemical Manufacturers, EPA–HQ–OAR–2021–0257–0139 (AFPM) at 26 (“And no reliance interests derive from this decision because one could not reasonably expect that the standards approved in that waiver would remain untouched. As part of the 2013 waiver decision, EPA and CARB committed to a 2018 mid-term evaluation of the federal standards for MYs 2022–2025.”); Urban Air at 22; NADA at 6 (“as discussed at length repeatedly in EPA’s 2013 CAA preemption waiver rule, a coordinated mid-term evaluation (MTE) involving EPA and NHTSA’s MY 2022–2025 rules was expected to be conducted.”).

<sup>121</sup> AFPM at 26 (“Because California’s deemed-to-comply provision linked those standards to compliance with its own state program, any change in federal standards from the mid-term review would have required an equal overhaul of California’s emissions program for those future MYs.”); Urban Air at 22–23 (“The 2018-re-evaluation is relevant because California’s deemed-to-comply provision allowed a manufacturer to satisfy state GHG standards simply by complying with federal standards.”); NADA at 6 (“[A]s noted above, CA’s GHG mandates included both a “deem-to-comply” rule enabling vehicle manufacturers to meet those mandates by complying with applicable federal rules, and a commitment on the part of the state to conduct a mid-term evaluation of its own GHG standards.”).

<sup>122</sup> AFPM at 26–27; Urban Air at 22; NADA at 6.

<sup>123</sup> Urban Air at 23.

<sup>124</sup> CEI at 9.

<sup>125</sup> AFPM at 27. See also Urban Air at 20–21 (“And under the presumption that ‘an agency retains authority to reconsider and correct an earlier

[of section 209(b)(1)(B)] that served only to categorically bar state standards that reduce vehicular GHG emissions.”<sup>132</sup> Still, another commenter disagreed, arguing that EPA’s reconsideration was an appropriate reevaluation of the legal interpretation and facts upon which the initial waiver determination was based because—“reconsideration determinations do not become ‘policy’ decisions simply because they address substantive errors.”<sup>133</sup>

EPA also received comment on whether EPA’s actions were inappropriate because the Agency failed to satisfy the “requirements of reasoned decision-making.” Some commenters noted that EPA had taken the position in SAFE 1 that “reducing criteria pollution is of overriding importance” yet failed to “consider[] the criteria-pollution and SIP consequences of its Waiver Withdrawal and Section 177 Determination.”<sup>134</sup> Similarly, EPA received comments claiming that the decision to apply a new approach to the ACC program waiver section 209(b)(1)(B) was both unnecessary and unjustified because, as EPA acknowledged in SAFE 1, the Agency has consistently posited that section 209(b)(1)(B) calls for determining whether the State needs its own regulatory program, separate from that of the federal government, not whether the State needs each specific standard or package of standards for which it seeks a waiver.<sup>135</sup> One of these commenters pointed out that EPA also acknowledged that the phrase “such State standards” could reasonably remain the program-level interpretation (EPA’s traditional interpretation) yet the Agency chose to adopt a new interpretation and apply it to the more than five-year old ACC program waiver, impacting expectations and reliance interests.

The Agency also received comments on whether NHTSA’s finding of preemption under EPCA in the joint action granted EPA authority to reconsider the ACC program waiver. Commenters argued that NHTSA is charged with interpreting and

implementing EPCA and that its finding “that Congress prohibited California’s standards” in the same action cannot be ignored.<sup>136</sup> Still other commenters pointed to the language of section 209(b)(1) itself, where only three criteria are provided by which EPA can deny a waiver. As such, they argued, EPA cannot have broad, implicit authority to revoke a waiver on entirely different grounds than by which it may deny a waiver.<sup>137</sup> The commenters also argued that the joint context of the action did not grant the Agency special authority to reconsider, explaining that “[w]hat Congress directed EPA to consider when it wrote Section 209(b)(1) does not change depending on whether EPA acts alone or with another agency.”<sup>138</sup> Some commenters also pointedly noted that SAFE 1’s distinction between single-agency and joint actions is arbitrary and capricious and therefore not a valid basis for reconsideration because EPA stated it “does not intend in future waiver proceedings concerning submissions of California programs in other subject areas to consider factors outside the statutory criteria in section 209(b)(1)(A)–(C),”<sup>139</sup> and because NHTSA and EPA now consider SAFE 1 as “two severable actions.”<sup>140</sup>

#### *B. Analysis: EPA Inappropriately Exercised Its Limited Authority To Reconsider*

EPA finds it does have authority to reconsider waivers, although its reconsideration of previously-granted waivers is limited and circumscribed. In the context of adjudicatory decisions (as contrasted to rulemakings), administrative law principles and case law support limited reconsideration authority for waiver proceedings. For example, in *Ivy Sports Med., LLC v. Burwell*, 767 F.3d 81, 86, 93 (D.C. Cir. 2014), the D.C. Circuit noted that where a statute “does not contain an express provision granting [the agency] authority to reconsider,” “administrative agencies are assumed to possess at least some inherent authority to revisit prior decisions, at least if done in a timely fashion,” noting the baseline limitations of such inherent authority. And in *Chapman v. El Paso Nat. Gas Co.*, 204 F.2d 46, 53–54 (D.C. Cir. 1953), the D.C. Circuit made clear that once concluded, an adjudicatory decision

granting a right “may not be repudiated for the sole purpose of applying some quirk or change in administrative policy.”<sup>141</sup> These precedents suggest that, while agencies do generally possess some inherent authority to reconsider previous adjudicatory decisions, that authority is limited in scope.

Section 209 does not provide EPA with express authority to reconsider and withdraw a waiver previously granted to California. EPA’s authority thus stems from its inherent reconsideration authority. The 1967 legislative history provides some indication of congressional intent to preserve some implied authority for EPA to reconsider previous waiver decisions, but also to place limitations on it. This legislative history explains: “[i]mplicit in this provision is the right of the [Administrator] to withdraw the waiver at any time [if] after notice and an opportunity for public hearing he finds that the State of California no longer complies with the conditions of the waiver.”<sup>142</sup> Thus, from the earliest days of the program it has been understood that any withdrawal of a waiver should be tied to the statutory criteria and California’s compliance with them. This legislative history must be taken into account along with Congress’s intent expressed in the 1977 legislative history, which, as discussed previously, sought to ensure deference to California and to strengthen that state’s role in driving emissions-reducing technological innovation. Congress was also mindful to ensure the ability of other states to adopt California’s standards.<sup>143</sup> Ultimately, EPA concludes it has authority to reconsider previously-granted waivers, but that this authority may only be exercised sparingly. As discussed below, there are several considerations that support narrow authority to reconsider waiver grants.

First and most important, EPA believes its inherent authority to reconsider a waiver decision is

<sup>132</sup> *Id.* at 8, 19 (“No statute compelled EPA to reconsider the 2013 waiver at all, let alone to apply new policies to that long-settled decision rather than to new waiver requests.”); Twelve Public Interest Organizations app. 1 at 35 (“EPA relied exclusively on its purported discretion to reinterpret Section 209(b)(1)(B) of the Clean Air Act . . . and its purported discretion to consider factors not enumerated in Section 209(b)(1).”). See also SCAQMD at 3 (“Because the 2013 waiver decision was not pending judicial review in 2019 and was a long-closed matter, the EPA could not rightfully reopen its adjudication.”).

<sup>143</sup> See *supra* Section III.B.

constrained by the three waiver criteria that must be considered before granting or denying a waiver request under section 209(b). It would be inappropriate and inconsistent with congressional intent for EPA to reconsider and withdraw a waiver on a ground outside the limited scope of those which Congress specified for EPA to consider when reviewing a waiver in the first place.<sup>144</sup> In the few instances where the Agency reconsidered prior waiver decisions prior to SAFE 1, EPA focused its review on the section 209(b) statutory waiver criteria.<sup>145</sup>

A circumscribed approach to reconsideration of waivers is consistent with the deference to California's policy judgment that Congress built into the waiver process.<sup>146</sup> Congress explicitly required that EPA "shall" grant the waiver unless one of three limited criteria are met. The use of the word "shall" (versus "may") was heavily debated by the enacting Congress, with the successful proponents of "shall" explaining that such language would "guarantee" that California could regulate with the burden placed on EPA to demonstrate why California should not be allowed to go beyond federal limitations.<sup>147</sup> Congress's legislative enactments since its creation of the waiver program—including adding section 177 to allow other states to adopt California's standards in 1977 and section 209(e)(2)(A) to create parallel deference for nonroad engines and vehicles in 1990—reinforce the important role it envisioned for, and deference it afforded to, California.<sup>148</sup>

In SAFE 1, EPA argued instead that deference to California was not merited where the Agency was interpreting its "own statute."<sup>149</sup> But in Title II of the Clean Air Act, Congress envisioned two standards—California and Federal.<sup>150</sup>

Congress recognized California's early attempts to address motor vehicle emissions intended to address its extraordinary environmental conditions as well as being a laboratory for motor vehicle emissions control.<sup>151</sup> Congress called for EPA deference to California in implementing section 209(b) by not only limiting EPA review of California waiver requests to three specific criteria but also instructing that EPA is "to afford California the broadest possible discretion in selecting the best means to protect the health of its citizens and the public welfare."<sup>152</sup> Similarly, "[t]he Administrator, . . . is not to overturn California's judgment lightly. Nor is he to substitute his judgment for that of the State."<sup>153</sup> Additionally, the D.C. Circuit has explained that "Congress consciously chose to permit California to blaze its own trail with a minimum of federal oversight" and "[t]he statute does not provide for any probing substantive review of the California standards by federal officials."<sup>154</sup> Further, "[t]here is no indication in either the statute or the legislative history that . . . the Administrator is supposed to determine whether California's standards are in fact sagacious and beneficial."<sup>155</sup> Thus, early in the waiver program's history, EPA explained the deference that Congress intended for the Agency's review of waiver requests by noting that it would feel constrained to approve a California approach to a problem that the EPA Administrator might not feel able to adopt at the federal level as a regulator. EPA explained that the balancing of risks and costs against potential benefits from reduced emissions is a central policy decision for any regulatory agency and substantial deference should be provided to California's judgement on such matters.<sup>156</sup>

In addition, limiting reconsideration of waivers undergirds Congress' intent that California would be a laboratory for the country driving emissions-reducing

technological innovation when it created the program in the first place. As the D.C. Circuit explained in *MEMA I*: "The history of congressional consideration of the California waiver provision, from its original enactment up through 1977, indicates that Congress intended the State to continue and expand its pioneering efforts at adopting and enforcing motor vehicle emission standards different from and in large measure more advanced than the corresponding federal program; in short, to act as a kind of laboratory for innovation."<sup>157</sup> Indeed, broad authority to reconsider waiver grants could undermine the very structure that Congress built in Title II. Specifically, while EPA does not consider section 177 when reviewing waiver requests under section 209, Congress built a structure wherein EPA must grant California a waiver under section 209 unless one of the three statutory criteria are met, and then other states may adopt California's standards under section 177 as part of their overall air quality programs. Limited inherent authority to reconsider previously-granted waivers as described in this action is important to the success of Congress's structure.

Finally, even the sentence in the legislative history that suggests EPA has inherent reconsideration authority in the first place, and which SAFE 1 relied on for its assertion of inherent reconsideration authority, lends weight to the view that this authority is limited. According to the Senate report from the 1967 CAA amendments, the Administrator has "the right . . . to withdraw the waiver at any time [if] after notice and an opportunity for public hearing he finds that the State of California no longer complies with the conditions of the waiver."<sup>158</sup> That specific circumstance—where California does not comply with the conditions of a waiver—should not be expanded to include a gaping hole for discretionary administrative policy changes.

Given all of the above considerations, several principles emerge. EPA's authority to reconsider a grant of a waiver, which is an adjudicatory action by the Administrator, is not open-ended. Any reconsideration is constrained to the criteria that Congress set out in section 209(b). Even within those statutory criteria, considering all of the factors that weigh in favor of a narrow interpretation of the Agency's authority and the importance of not disrupting Congress's scheme, EPA believes reconsideration is limited to situations where the Agency has made

<sup>144</sup> See *MEMA I*, 627 F.2d at 1115 (noting that section 209(b) creates "a narrowly circumscribed proceeding requiring no broad policy judgments").

<sup>145</sup> EPA initiated reconsideration of certain motorcycle standards, under the third waiver prong, section 209(b)(1)(C), in order to "vacate that portion of the waiver previously granted under section 209(b)." 47 FR 7306, 7309 (February 18, 1982). a clerical or factual error or mistake, or where information shows that factual circumstances or conditions related to the waiver criteria evaluated when the waiver was granted have changed so significantly that the propriety of the waiver grant is called into doubt.

Even if the bases for EPA's reconsideration did satisfy one of the foregoing conditions such that reconsideration may be appropriate, during that reconsideration EPA believes it should consider the passage of time and reliance interests. In the context of CAA waiver grants in general, and the 2013 ACC program waiver grant in particular, California is relying on its standards to meet short- and long-term emission reduction goals.<sup>159</sup> In addition, by the time the SAFE proposal was published, twelve states had already adopted at least one or both of the GHG and ZEV standards.<sup>160</sup> Several of these states incorporated these adopted standards into their SIPs.<sup>161</sup> Several automakers and industry groups have also indicated reliance on these standards.<sup>162</sup>

Reconsideration thus must carefully consider the factors noted and should not be undertaken where immense degrees of uncertainty are introduced in settled expectations of California, other states, and regulated industry or to allow for the continual questioning of EPA's decisions, thus impairing needed finality. Such reconsideration could frustrate congressional intent in designing the waiver program and ultimately discourage reliance by the recipient of EPA's waiver decision (CARB), states that may have adopted CARB's regulations under the terms of section 177 (and are permitted to enforce the regulations once EPA grants

a waiver to California) as well as the regulated industry.

We now turn to whether the reconsideration in SAFE 1 was a proper exercise of EPA's inherent reconsideration authority. As an initial matter, SAFE 1 did not assert that any clerical or factual error or mistake was made in the 2013 ACC program waiver. Nor did SAFE 1 point to any evidence showing that factual circumstances or conditions related to the waiver criteria evaluated when the waiver was granted have changed so significantly that the propriety of the waiver grant is called into doubt. For example, SAFE 1 did not assert that California was not complying with the terms of the waiver. Instead, SAFE 1's reconsideration was premised on retroactive application of discretionary policy changes. Therefore, EPA believes it did not appropriately exercise its inherent authority in SAFE 1 to reconsider the prior ACC program waiver. Upon reconsideration, and as further shown in Sections V and VI, EPA now believes that SAFE 1 amounted to an improper exercise of the Agency's limited inherent authority to reconsider.<sup>163</sup>

SAFE 1 gave two primary reasons for withdrawing the 2013 ACC program waiver. Neither was an appropriate basis for reconsideration. First, SAFE 1 premised the revocation on its interpretation of the second waiver prong, section 209(b)(1)(B), that called for the Agency's scrutiny of specific standards under the waiver rather than California's program as a whole. As explained in detail in Section V of this final action, that statutory interpretation is flawed, and EPA does not believe a new statutory interpretation should be

the basis of reconsidering the grant of a waiver.

SAFE 1 premised the withdrawal of the ACC program waiver under section 209(b)(1)(B) on the perceived lack of record support on the causal link between GHG emission standards and air quality conditions in California.<sup>164</sup> Yet, the underlying record from the ACC program waiver, and the record of SAFE 1, have shown that CARB's ZEV sales mandate and GHG emission standards are designed to address California's serious air quality problems, including both its NAAQS pollutants and a variety of climate impacts from GHG emissions. As discussed in greater detail in Section V, EPA has since at least 2009 recognized that greenhouse gas pollution exacerbates criteria pollution, and climate change impacts on California's air quality conditions (*e.g.*, heat exacerbation of ozone).<sup>165</sup> The ACC program was especially designed to

<sup>164</sup> "California's approach in its ACC program waiver request differed from the state's approach in its waiver request for MY 2011 and subsequent heavy-duty tractor-trailer GHG standards, where California quantified NO<sub>x</sub> emissions reductions attributed to GHG standards and explained that they would contribute to PM and ozone NAAQS attainment." 84 FR at 51337 n.252 (citing 79 FR at 46256, 46257 n.15, 46261, 46262 n.75).

<sup>165</sup> The first HD GHG emissions standard waiver related to certain new 2011 and subsequent model year tractor-trailers. 79 FR 46256 (August 7, 2014). CARB projected, for example, "reductions in NO<sub>x</sub> emissions of 3.1 tons per day in 2014 and one ton per day in 2020" in California. *Id.* at 46261. The second HD GHG emissions standard waiver related to CARB's "Phase I" regulation for 2014 and subsequent model year tractor-trailers. 81 FR 95982 (December 29, 2016).

CARB also noted the scientific findings since EPA's 2009 GHG waiver including the report titled "Our Changing Climate 2012 Vulnerability & Adaptation to the Increasing Risks from Climate Change in California." The summary report highlights new insights for the energy, water, agriculture, public health, coastal, transportation, and ecological resource sectors that are vital to California residents and businesses. The study also predicts that peak concentrations of dangerous airborne particles will increase in the San Joaquin Valley because of climate change on wind patterns. This study provides further evidence of what is known as the "climate penalty," where rising temperatures increase ground-level ozone and health-damaging particles, despite the reductions achieved by successful programs targeting smog-forming emissions from cars, trucks, and industrial sources. *Id.* at 8–9. *See also* "The Impacts of Climate Change on Human Health in the United States: A Scientific Assessment" Chapter 3 Air Quality Impacts—Key Finding ("Climate change will make it harder for any given regulatory approach to reduce ground-level ozone pollution in the future as meteorological conditions become increasingly conducive to forming ozone over most of the United States. Unless offset by additional emissions reductions, these climate-driven increases in ozone will cause premature deaths, hospital visits, lost school days, and acute respiratory symptoms.") at <https://health2016.globalchange.gov/air-quality-impacts/>; Chapter 13: Air Quality, Fourth National Climate Assessment at <https://nca2018.globalchange.gov/chapter/13/>.

<sup>161</sup> *Id.* at 10; Wisconsin Department of Natural Resources (Wisconsin), Docket No. EPA–HQ–OAR–2021–0257–0095 at 1 ("These standards provide important and necessary reductions in both GHG and criteria pollutant emissions needed to meet state and local air quality goals and address federal CAA requirements."); Connecticut at 2 ("These programs enable long-term planning and yield critical emission reductions that are critical to meeting Connecticut's climate goals as well as our statutory obligations to reach attainment with the ozone NAAQS."); Delaware 2 ("Delaware adopted the California LEV regulation and incorporated the LEV and GHG standards into the State Implementation Plan. . . . Delaware will not meet air quality goals without more protective vehicle emission standards."); Maine at 1 ("[T]he LEV program was initially created to help attain and maintain the health-based National Ambient Air Quality Standards (NAAQS) . . . The California ZEV and GHG programs enable long-term planning for both the states and the regulated community and have been drivers of technological change across the industry.').

<sup>162</sup> *E.g.*, Ford at 1; Tesla at n.5, 4; Rivian (as a member of NCAT) at 13–14.

<sup>163</sup> EPA acknowledges that, in the SAFE 1 proceedings, it had noted that at the time of proposal that CARB had given notice that it was considering amending its "deemed to comply" provision and that by the time of SAFE 1, California had entered into agreements with several automobile manufacturers to accept less stringent standards than the California program or the Federal standards as promulgated in 2012. As noted in SAFE 1, EPA believed that neither of these matters were necessary for EPA's action in SAFE 1, but that they provided further support for the action. 84 FR at 51334 n.230. By this action, EPA finds that neither of these matters amounted to a change in circumstances or conditions associated with the three waiver criteria and EPA's evaluation of the criteria in the ACC program waiver. EPA did not predicate its ACC program waiver on CARB's deemed-to-comply provision or any changes to the deemed-to-comply provision. (EPA does not take a position as to whether that provision has changed in its purpose as a result of CARB's 2018 amendment). Further, to the extent CARB utilized a deemed-to-comply provision or uses non-regulatory mechanisms to achieve its air quality objectives, this had no bearing on EPA's assessment of whether CARB has a need for its standards under the second waiver prong at the time of SAFE 1 or now.

address both criteria and GHG pollution, including the effects of GHG pollution on criteria pollution in California.<sup>166</sup> As also further discussed in Section V, in SAFE 1 the Agency dismissed the criteria pollutant benefits of California's ZEV sales mandate requirements based on a snippet from the 2012 waiver request, taken out of context.<sup>167</sup> This was also remarkable considering EPA's prior waivers for ZEV sales mandate requirements that demonstrated criteria pollutant emissions reduction benefits.<sup>168</sup> The record also includes information that demonstrates that a withdrawal of the waiver for the GHG emission standards and ZEV sales mandate (and leaving the Federal GHG standards at the 2020 levels as proposed in SAFE) would increase NOx emissions in the South Coast air basin alone by 1.24 tons per day.<sup>169</sup> In sum, EPA opted to elide the available ample technical support from the ACC program waiver proceedings. EPA's factual predicates in SAFE 1—that there was no criteria pollutant benefit of the GHG standards and ZEV sales mandate—for reconsideration based on the second waiver prong were simply inaccurate and inappropriate. Reconsideration was thus improper on this basis because there were no factual errors in the ACC program waiver and EPA should not be exercising authority to reconsider prior valid waivers that present no factual errors based on different statutory interpretations.

Second, SAFE 1 premised its revocation on NHTSA's finding of preemption under EPCA. This, too, was an inappropriate ground for reconsideration. As earlier noted, EPA believes its inherent authority to reconsider a waiver decision is constrained by the three waiver criteria that must be considered before granting or denying a waiver request under section 209(b). Preemption under EPCA is not one of these criteria and was not considered in CARB's ACC program

<sup>166</sup> 2012 Waiver Request at 1, 9–11, 15–17 (“[A]s detailed below, the ACC program will result in reductions of both criteria pollutants and GHG emissions that, in the aggregate, are more protective than the federal standards that exist.”). 78 FR at 2122 ([T]he ACC program will result in reductions of both criteria pollutants and GHG emissions.”).

<sup>167</sup> 84 FR at 51337 (quoting CARB's statement that “[t]here is no criteria emissions benefit from including the ZEV proposal in terms of vehicle (tank-to-wheel or TTW) emissions.”). As explained in more detail below, this statement merely reflected how CARB attributed pollution reductions between its different standards and compliance mandates, not the reality of how those standards and mandates actually drive pollution reductions.

<sup>168</sup> 58 FR 4156, 71 FR 78190 (December 28, 2006); 75 FR 11878 (March 12, 2010) and 76 FR 61095 (October 3, 2011).

<sup>169</sup> States and Cities at 10.

waiver request or in EPA's granting of that waiver. In fact, in its waiver grant, the Agency expressly found that consideration of preemption under EPCA would be inappropriate and unnecessary. In SAFE 1, the Agency did not premise its consideration of preemption under EPCA on any of the three statutory criteria. Therefore, EPA believes that SAFE 1 was not a proper exercise of the authority to reconsider on this basis, and any subsequent action in SAFE 1 to withdraw the ACC program waiver was inappropriate.

Although SAFE 1 was an inappropriate exercise of inherent authority given that the Agency did not correct a factual error and there was no change in factual circumstances so significant that the propriety of the waiver would be called into doubt, it is nevertheless relevant to note that SAFE 1 did not give appropriate consideration to the passage of time and the reliance interests that had developed between the granting and the revocation of the ACC program waiver. Several automakers and industry groups have also indicated reliance on these standards, as previously discussed.<sup>170</sup> California and section 177 states were, by the time of the reconsideration, into the long-term plans they had developed relying on the ACC program waiver standards.<sup>171</sup> California and other states

<sup>170</sup> *E.g.*, Ford at 1; Tesla at n.5, 4; Rivian (as a member of NCAT) at 13–14. EPA notes that it received limited comment on whether reliance interests had formed since the issuance of SAFE 1 but nothing to demonstrate error in the findings regarding section 209(b)(1)(C) made within the ACC program waiver. See Toyota, Docket No. EPA–HQ–OAR–2021–0381 (“Reinstatement of California's waiver for model years 2021 and 2022 poses significant lead time challenges considering that 2021 model year is well underway, and 2022 model year vehicles are generally already designed, sourced, certified to various regulatory requirements, and ready to begin production.”). Further, as discussed elsewhere, the short passage of time since the promulgation of SAFE 1 and ongoing litigation over that action has, as automakers have noted in that briefing, prevented automakers from relying on the waiver revocation. See also Twelve Public Interest Organizations at 11 (noting filings by automakers suggesting lack of reliance on the waiver withdrawal).

<sup>171</sup> *E.g.*, States and Cities at 17 (the length between the waiver grant and reconsideration was too long “by any measure.”); Twelve Public Interest Organizations at app. 36. EPA acknowledges the commenter who argued that “timeliness depends on reliance interests” and, because the standards were not final before the MTE, the time period at issue is the four months between the MTE and the SAFE 1 proposal. Urban Air at 24. EPA also received comment that disagreed with this accounting of time stating that timeliness for reconsidering an adjudication is measured from the date of the agency's decision, not from the date of activity resulting from that decision. *E.g.*, *Am. Methyl*, 749 F.2d at 835 (tethering timeliness to period for appeal of agency decision.” Twelve Public Interest Organizations app. 1 at 38. EPA believes it is not necessary to resolve the

rely on waivers that EPA has approved to meet short- and long-term emission reduction goals.<sup>172</sup> In addition, by the time the SAFE proposal was published, twelve states had already adopted at least one or both of the GHG and ZEV standards.<sup>173</sup> Several of these states incorporated these adopted standards into their SIPs.<sup>174</sup>

SAFE 1 barely mentioned these reliance interests, explaining only that the Agency “will consider whether and how to address SIP implications of this action, to the extent that they exist, in separate actions; EPA believes that it is not necessary to resolve those implications in the course of this action.”<sup>175</sup> EPA now believes that,

permissible amount of time, or the existence or lack of a bright line, that may pass before reconsideration of its prior adjudication is no longer appropriate. However, EPA did not “condition” its ACC program waiver on any subsequent actions, including the MTE, which explicitly applied to the federal standards. See 78 FR at 2137. EPA expects its waiver adjudications to be final and that appropriate reliance may flow to affected parties. Moreover, in this instance EPA did not make any final determination regarding the third waiver prong at section 209(b)(1)(C). EPA notes that it has administered the California waiver program for a number of decades and acknowledges that emission standards continue to evolve at the California and the federal levels. This evolution in the standards has rested on regulatory certainty and the enforceability of CARB's emission standards once a waiver has been issued by EPA under section 209(b) of the CAA. As for the inclusion of the deemed-to-comply provision in the California standards, California provided documentation demonstrating that the deemed-to-comply provision was reliant upon the federal standards having a certain level of stringency, a fact that EPA had recognized. See States and Cities at 18–19 n. 14, 57–60. EPA found that the California standards were feasible even without the deemed-to-comply provision, 78 FR at 2138, making it irrelevant to the waiver grant. California's own actions with respect to its standards, such as its independent review of the ACC program, cannot disturb California's or other state's reliance on the federal waiver.

<sup>172</sup> States and Cities at 17–18.

<sup>173</sup> *Id.* at 17.

<sup>174</sup> *Id.* at 10; Wisconsin Department of Natural Resources (Wisconsin), Docket No. EPA–HQ–OAR–2021–0257–0095 at 1 (“These standards provide important and necessary reductions in both GHG and criteria pollutant emissions needed to meet state and local air quality goals and address federal CAA requirements.”); Connecticut at 2 (“These programs enable long-term planning and yield critical emission reductions that are critical to meeting Connecticut's climate goals as well as our statutory obligations to reach attainment with the ozone NAAQs.”); Delaware 2 (“Delaware adopted the California LEV regulation and incorporated the LEV and GHG standards into the State Implementation Plan. . . . Delaware will not meet air quality goals without more protective vehicle emission standards.”); Maine at 1 (“[T]he LEV program was initially created to help attain and maintain the health-based National Ambient Air Quality Standards (NAAQS). . . . The California ZEV and GHG programs enable long-term planning for both the states and the regulated community and have been drivers of technological change across the industry.”).

<sup>175</sup> *Id.* at 51324 n.167.

when exercising its inherent authority to reconsider the 2013 waiver decision, it was inappropriate to ignore these possible reliance interests and to “resolve” any potential implications at a later time. In the SAFE 1 context, while it was not necessary to resolve the status of every SIP, it was inappropriate to not even consider the reliance interests raised by the adoption of California standards by section 177 states (including, but not limited to, their adoption into SIPs). EPA has consistently recognized the importance of long-term planning in the attainment and maintenance of NAAQS.<sup>176</sup> Given the long-term nature of these plans, it is “challenging (if not impossible) to change them quickly,” and any changes in one part of a SIP can affect multiple sectors of the economy.<sup>177</sup>

As noted above, EPA also received other comments regarding reliance interests, including those noting that the midterm evaluation (MTE) was an indication that the technological feasibility of the GHG emission standards was not a settled matter and hence no certainty or reliance could accrue. EPA, however, did not “condition” its ACC program waiver on any subsequent actions, including the

<sup>176</sup> EPA is responsible for approving SIPs and SIP amendments, which span years. *See, e.g.*, 82 FR 42233 (September 7, 2017) (approval of Maine’s SIP revision including updates to be consistent with California’s updated LEV program); 80 FR 13768 (March 17, 2015) (approval of Connecticut’s SIP revision, including the adoption of elements of California’s LEV program). For example, states with areas that achieve attainment for any air pollutant must submit for EPA approval a revised SIP that sets out the State’s plan for maintaining attainment for at least ten years after the redesignation. At the end of that ten-year period, the State must submit another ten-year maintenance plan to EPA for approval. 42 U.S.C. 7505a.

<sup>177</sup> Twelve Public Interest Organizations app. 1 at 29, 30. Several states also commented, during this reconsideration, that they rely on the California GHG standards and ZEV sales mandate to reach their own state emission reduction goals. *E.g.*, Connecticut at 2 (“Reducing GHG emissions from the transportation sector is required to achieve Connecticut’s economy-wide targets of at least 45 percent below 2001 levels by 2030 and 80 percent below 2001 levels by 2050, as required by the 2008 Global Warming Solutions Act (GWSA) and the 2018 Act Concerning Climate Change Planning and Resiliency.”); Minnesota at 2 (“[California’s standards] are vitally important in helping our state achieve our GHG emission reduction goals and reduce other harmful air pollutants, especially in communities of color and lower-income communities, which are disproportionately impacted by vehicle pollution. The MPCA found that these rules are needed to address GHG emissions in our state and take steps towards achieving Minnesota’s statutory Next Generation Energy Act GHG reduction goals. On May 7, 2021, an independent Administrative Law Judge affirmed the MPCA findings.”); Maine at 1 n.3 (“Maine statute at 38 M.R.S 576–A establishes tiered GHG emission reduction requirements culminating in gross annual reductions of at least 80% from 1990 baseline levels.”).

MTE.<sup>178</sup> EPA expects its waiver adjudications to be final and that appropriate reliance may flow to affected parties. Moreover, in this instance EPA did not make any final determination regarding the third waiver prong at section 209(b)(1)(C). EPA notes that it has administered the California waiver program for a number of decades and acknowledges that emission standards continue to evolve at the California and the federal levels. This evolution in the standards has rested on regulatory certainty and the enforceability of CARB’s emission standards once a waiver has been issued by EPA under section 209(b) of the CAA.

EPA’s historic practice of properly affording broad discretion to California has meant that in almost fifty years of administering the California waiver program the Agency had never withdrawn any waiver prior to SAFE 1. And while SAFE 1 cited prior reconsideration actions as support for the Agency’s authority to reconsider prior waiver decisions, as previously noted, EPA has historically limited reconsideration of prior waived standards to statutory criteria and most important, none of these prior reconsideration actions resulted in a revocation.<sup>179</sup> As further shown in Sections V and VI, SAFE 1 was the result of a “probing substantive review of the California standards,” with the Agency substituting its own judgment for California’s contrary to both congressional exhortation of deference to California and the Agency’s review practice.

This present reconsideration is an appropriate exercise of the Agency’s reconsideration authority. It is not at all clear that the reasons for limiting reconsideration of waiver grants apply to the same degree to reconsideration of waiver denials and withdrawals. However, EPA need not resolve the question in this action, because this action falls well within the bounds of even the limited authority this action concludes the Agency possesses for reconsideration of waiver grants. First, this action corrects factual errors made in the SAFE 1 waiver withdrawal. Specifically, even under SAFE 1’s flawed interpretation of section 209(b)(1)(B), SAFE 1 ignored facts demonstrating that California does need the specific standards at issue to meet compelling and extraordinary

<sup>178</sup> *See* 78 FR at 2137.

<sup>179</sup> *See, e.g.*, 43 FR at 7310 (affirming the grant of the waiver in the absence of “findings necessary to revoke California’s waiver of Federal preemption for its motorcycle fill-pipe and fuel tank opening regulations.”).

conditions. Second, in this reconsideration EPA properly constrains its analysis to whether SAFE 1 made one of the three statutory findings necessary to deny a waiver. Third, this reconsideration is timely with respect to the finalization of SAFE 1 and limited, if any, reliance interests have developed as a result of SAFE 1 (which has been subject to judicial review since its promulgation).

### C. Conclusion

In SAFE 1, EPA inappropriately exercised its limited inherent authority to reconsider the ACC program waiver for several reasons. EPA believes its exercise of reconsideration authority to reinterpret the language of section 209(b)(1)(B) was not taken to correct any factual or clerical error or based upon factual circumstances or conditions related to the waiver criteria evaluated when the waiver was granted that have changed so significantly that the propriety of the waiver grant is called into doubt. Rather, as discussed in detail in Section V, it was based upon a flawed statutory interpretation and a misapplication of the facts under that interpretation. Likewise, EPA’s decision to reconsider the ACC program waiver based on NHTSA’s rulemaking within SAFE 1, which raised issues beyond the statutory waiver criteria, was inappropriate. For these reasons EPA now believes it is appropriate to rescind its actions within SAFE 1.

### V. The SAFE 1 Interpretation of Section 209(b)(1)(B) was Inappropriate and, in any Event, California met its Requirements

Even if SAFE 1’s reconsideration of the 2013 program waiver grant was appropriate, EPA concludes for two independent reasons that its waiver withdrawal in SAFE 1 based upon its new statutory interpretation was flawed. First, EPA concludes that the SAFE 1 interpretation of the second waiver prong was not an appropriate reading of that second waiver prong, section 209(b)(1)(B). It bears noting that the traditional interpretation is, at least, the better interpretation. Informed by but separate from the factual analysis discussed next, the Agency finds that the new interpretation set out in SAFE 1 was inconsistent with congressional intent and contrary to the purpose of section 209(b). Under the traditional interpretation of the second waiver prong, California’s need for its own motor vehicle program, including its GHG emission standards and ZEV sales mandate, to meet compelling and extraordinary conditions is clear and the

waiver should not have been withdrawn.

Second, even if the interpretation in SAFE 1 were appropriate, EPA concludes that SAFE 1 incorrectly found that California did not have a need for its specific standards. EPA has evaluated California's need for both requirements by applying both the traditional and the SAFE 1 interpretations of section 209(b)(1)(B). In doing so, EPA reviewed the record from the ACC program waiver proceedings, including CARB's ACC program waiver request and supporting documents, as well as the comments received as part of the SAFE 1 proceeding and the comments received under the present reconsideration of SAFE 1.<sup>180</sup> The record review focused on salient pronouncements and findings in the ACC program waiver decision, such as the relationship of both criteria and GHG pollutants and the impacts of climate change on California's serious air quality conditions. For example, the effects of climate change and the heat exacerbation of tropospheric ozone is well established. California's ACC program is established, in part, to address this. California's program, including its GHG emission standards, is also designed to address upstream criteria emission pollutants. The review did so primarily because SAFE 1 premised the withdrawal of the GHG standards at issue on the lack of a causal link between GHG standards and air quality conditions in California. The review included EPA's prior findings regarding heat exacerbation of ozone, a serious air quality issue recognized by EPA as presenting compelling and extraordinary conditions under the second waiver prong.

On completion of this review, EPA finds no basis for discounting the ample record support on California's need for both the GHG standards and the ZEV sales mandate to address compelling and extraordinary conditions in California when using both the

traditional and SAFE 1 interpretation to the second waiver prong. Additionally, because of the way CARB's motor vehicle emission standards operate in tandem and are designed to reduce both criteria and GHG pollution and the ways in which GHG pollution exacerbates California's serious air quality problems, including the heat exacerbation of ozone, the Agency in SAFE 1 should not have evaluated California's specific "need" for GHG standards. In sum, in reconsidering SAFE 1, and after having now reviewed and evaluated the complete factual record, EPA reaffirms that California needs the GHG standards and ZEV sales mandate at issue to "meet compelling and extraordinary conditions."

#### A. Historical Practice

Under section 209(b)(1)(B), EPA shall not grant a waiver if California "does not need such State standards to meet compelling and extraordinary conditions." For nearly the entire history of the waiver program, EPA has read the phrase "such State standards" in section 209(b)(1)(B) as referring back to standards "in the aggregate," in the root paragraph of section 209(b)(1), which calls for California to make a protectiveness finding for its standards. EPA has interpreted the phrase "in the aggregate" as referring to California's program as a whole, rather than each State standard, and as such not calling for the Agency's standard-by-standard analysis of California's waiver request.<sup>181</sup> EPA has thus reasoned that both statutory provisions must be read together so that the Agency reviews the same standards that California considers in making its protectiveness determination and to afford California discretion.<sup>182</sup> The D.C. Circuit has also stated that "[t]he expansive statutory language gives California (and in turn EPA) a good deal of flexibility in assessing California's regulatory needs. We therefore find no basis to disturb

EPA's reasonable interpretation of the second criterion."<sup>183</sup>

In addressing the Agency's reading of section 209(b)(1)(B), for example, in the 1983 LEV waiver request EPA explained that:

This approach to the "need" criterion is also consistent with the fact that because California standards must be as protective as Federal standards in the aggregate, it is permissible for a particular California standard or standards to be less protective than the corresponding Federal standard. For example, for many years, California chose to allow a carbon monoxide standard for passenger cars that was less stringent than the corresponding Federal standard as a "trade-off" for California's stringent nitrogen oxide standard. Under a standard of review like that proposed by MVMA/AIAM, EPA could not approve a waiver request for only a less stringent California standard because such a standard, in isolation, necessarily could be found to be contributing to rather than helping, California's air pollution problems.<sup>184</sup>

In 1994, EPA again had cause to explain the Agency's reading of section 209(b)(1)(B) in the context of California's particulate matter standards waiver request:

[T]o find that the 'compelling and extraordinary conditions' test should apply to each pollutant would conflict with the amendment to section 209 in 1977 allowing California to select standards 'in the aggregate' at least as protective as federal standards. In enacting that change, Congress explicitly recognized that California's mix of standards could 'include some less stringent than the corresponding federal standards.' See H.R. Rep. No. 294, 95th Cong., 1st Sess. 302 (1977). Congress could not have given this flexibility to California and simultaneously assigned to the state the

<sup>180</sup> EPA notes that it reviewed the factual record within the ACC program waiver proceeding and finds there was no factual error in its evaluation of whether CARB's standards satisfied the second waiver prong. EPA also notes, merely as confirming the finding it made at the time of the ACC program waiver but not for purposes of making a new factual finding from that made at the time of the ACC program waiver decision, that the record and information contained in the SAFE 1 proceeding as well as the record and information contained in the Agency's reconsideration of SAFE 1 (including late comments submitted during the SAFE 1 proceeding and, in some cases, resubmitted during the Agency's reconsideration of SAFE 1) at each point in time clearly demonstrates the need of California's standards (whether evaluated as a program or as specific standards) to meet compelling and extraordinary conditions within California.

<sup>181</sup> "The interpretation that my inquiry under (b)(1)(B) goes to California's need for its own mobile source program is borne out not only by the legislative history, but by the plain meaning of the statute as well." 49 FR at 18890.

<sup>182</sup> 74 FR at 32751 n. 44; 32761 n.104. EPA cited *Entergy Corp. v. Riverkeeper, Inc.*, 129 S. Ct. 1498 (2009) ("That view governs if it is a reasonable interpretation of the statute—not necessarily the only possible interpretation, nor even the interpretation deemed most reasonable by the courts"), and *Chevron U.S.A. Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837, 843–844 (1984). ("It seems to us, therefore, that the phrase 'best available,'" even with the added specification "for minimizing adverse environmental impact," does not unambiguously preclude cost-benefit analysis."). EPA*, No. 13–74019 (9th Cir. 2021) ("The EPA was not arbitrary and capricious in declining to find that 'California does not need such California standards to meet compelling and extraordinary conditions,' § 7543(e)(2)(A)(ii), under the alternative version of the needs test, which requires 'a review of whether the Fleet Requirements are per se needed to meet compelling and extraordinary conditions,' 78 FR at 58,103. The EPA considered 'the relevant factors,' *Motor Vehicle Mfrs. Ass'n of U.S. v. State Farm Mut. Auto. Ins. Co., Inc.*, 463 U.S. 29, 42–43 (1983), including statewide air quality, 78 FR 58,104, the state's compliance with federal National Ambient Air Quality standards for ozone and PM<sub>2.5</sub> on a statewide basis, *id.* at 58,103–04, the statewide public health benefits, *id.* at 58,104, and the utility of the Fleet Requirements in assisting California to meet its goals, *id.* at 58,110. Contrary to Dalton's argument, the EPA did not limit its review to two of California's fourteen air quality regions. The EPA examined the relevant data provided by CARB, and it articulated a 'satisfactory explanation for its action including a rational connection between the facts found and the choice made.' See *Motor Vehicle Mfrs. Ass'n of U.S., Inc.*, 463 U.S. at 43, 103 S.Ct. 2856 (cleaned up).")

<sup>184</sup> 58 FR 4166, LEV Waiver Decision Document at 50–51.

seemingly impossible task of establishing that ‘extraordinary and compelling conditions’ exist for each standard.<sup>185</sup>

Congress has also not disturbed this reading of section 209(b)(1)(B) as calling for EPA review of California’s whole program. With two noted exceptions described below, EPA has consistently interpreted this provision as requiring the Agency to consider whether California needs a separate motor vehicle emission program as compared to the specific standards in the waiver request at issue to meet compelling and extraordinary conditions.

Congress intended to allow California to address its extraordinary environmental conditions and foster its role as a laboratory for motor vehicle emissions control. The Agency’s long-standing practice therefore has been to evaluate CARB’s waiver requests with the broadest possible discretion to allow California to select the means it determines best to protect the health and welfare of its citizens in recognition of both the harsh reality of California’s air pollution and to serve as a pioneer and a laboratory for the nation in setting new motor vehicle emission standards and developing control technology.<sup>186</sup> EPA notes that “the statute does not provide for any probing substantive review of the California standards by federal officials.”<sup>187</sup>

As a general matter, EPA has applied the traditional interpretation in the same way for all air pollutants, criteria and GHG pollutants alike.<sup>188</sup> As discussed in Section II, there have only been two exceptions to this practice: one in 2008 and one in 2019. In 2008, EPA for the first time analyzed California’s waiver request under an alternative approach and denied CARB’s waiver request. EPA concluded that section 209(b) was intended to allow California to promulgate state standards applicable to emissions from new motor vehicles to address air pollution problems that are local or regional, but that section 209(b)(1)(B) was not intended to allow California to promulgate state standards for emissions from new motor vehicles designed to address global climate change problems. Or, in the alternative,

EPA concluded that effects of climate change in California were not compelling and extraordinary compared to the effects in the rest of the country.<sup>189</sup> EPA rejected this view a little over a year later in 2009 by applying the traditional interpretation in granting California’s waiver request for the same GHG standard, finding no support in the statute or congressional intent for the alternative application of the statute.<sup>190</sup>

In evaluating the ACC program waiver in 2013, EPA applied the traditional interpretation to the ACC program waiver request and found that the Agency could not deny the waiver request under the second waiver prong.<sup>191</sup> Further, without adopting the alternative interpretation that had been applied in the 2008 GHG waiver denial, EPA assessed California’s need for the GHG standards at issue and found that the Agency could not deny the ACC program waiver request, even applying the alternative interpretation. EPA noted that to the extent that it was appropriate to examine the CARB’s need for the GHG standards at issue to meet compelling and extraordinary conditions, the Agency had discussed at length in the 2009 GHG waiver decision that California has compelling and extraordinary conditions directly related to regulations of GHGs.<sup>192</sup> Similarly,

<sup>189</sup> 73 FR at 12160–64.

<sup>190</sup> 74 FR at 32744, 32746, 32763 (“The text of section 209(b) and the legislative history, when viewed together, lead me to reject the interpretation adopted in the March 6, 2008 Denial, and to apply the traditional interpretation to the evaluation of California’s greenhouse gas standards for motor vehicles. If California needs a separate motor vehicle program to address the kinds of compelling and extraordinary conditions discussed in the traditional interpretation, then Congress intended that California could have such a program. Congress also intentionally provided California the broadest possible discretion in adopting the kind of standards in its motor vehicle program that California determines are appropriate to address air pollution problems and protect the health and welfare of its citizens. The better interpretation of the text and legislative history of this provision is that Congress did not use this criterion to limit California’s discretion to a certain category of air pollution problems, to the exclusion of others. EPA concluded that even under this alternative approach California GHG standards were intended at least in part to address a local or regional problem because of the ‘logical link between the local air pollution problem of ozone and GHG.’”).

<sup>191</sup> 78 FR at 2129 (“CARB has repeatedly demonstrated the need for its motor vehicle program to address compelling and extraordinary conditions in California. As discussed above, the term compelling and extraordinary conditions ‘does not refer to the levels of pollution directly.’ Instead, the term refers primarily to the factors that tend to produce higher levels of pollution—geographical and climatic conditions (like thermal inversions) that, when combined with large numbers and high concentrations of automobiles, create serious air pollution problems. California still faces such conditions.”).

<sup>192</sup> *Id.* at 2129–30.

EPA explained that to the extent it was appropriate to examine California’s need for the ZEV sales mandate, these requirements would enable California to meet both air quality and climate goals into the future.<sup>193</sup> Additionally, EPA recognized CARB’s coordinated strategies reflected in the technologies envisioned to meet the ACC program requirements and in turn addressing both criteria pollutants and GHGs and the magnitude of the technology and energy transformation needed to meet such goals.<sup>194</sup>

<sup>193</sup> *Id.* at 2129 (“[A]s EPA discussed at length in its 2009 GHG waiver decision, California does have compelling and extraordinary conditions directly related to regulations of GHG. EPA’s prior GHG waiver contained extensive discussion regarding the impacts of climate change in California. In addition, CARB has submitted additional evidence in comment on the ACC waiver request that evidences sufficiently different circumstances in California. CARB notes that “Record-setting fires, deadly heat waves, destructive storm surges, loss of winter snowpack—California has experienced all of these in the past decade and will experience more in the coming decades. California’s climate—much of what makes the state so unique and prosperous—is already changing, and those changes will only accelerate and intensify in the future. Extreme weather will be increasingly common as a result of climate change. In California, extreme events such as floods, heat waves, droughts and severe storms will increase in frequency and intensity. Many of these extreme events have the potential to dramatically affect human health and well-being, critical infrastructure and natural systems.” (footnotes omitted)).

<sup>194</sup> *Id.* at 2130–31 (“As CARB notes in its waiver request, the goal of the CARB Board in directing CARB staff to redesign the ZEV regulation was to focus primarily on zero emission drive—that is BEV, FCV, and PHEVs in order to move advanced, low GHG vehicles from demonstration phase to commercialization. CARB also analyzed pathways to meeting California’s long term 2050 GHG reduction targets in the light-duty vehicle sector and determined that ZEVs would need to reach nearly 100 percent of new vehicle sales between 2040 and 2050. CARB also notes that the “critical nature of the LEV III regulation is also highlighted in the recent effort to take a coordinated look at strategies to meet California’s multiple air quality and climate goals well into the future. This coordinated planning effort, Vision for Clean Air: A Framework for Air Quality and Climate Planning (Vision for Clean Air) demonstrates the magnitude of the technology and energy transformation needed from the transportation sector and associated energy production to meet federal standards and the goals set forth by California’s climate change requirements. . . . The Vision for Clean Air effort illustrates that in addition to the cleanup of passenger vehicles (at issue here) as soon as possible as required in the LEV III regulation, transition to zero- and near-zero emission technologies in all on- and off-road engine categories is necessary to achieve the coordinated goals. Therefore, EPA believes that CARB’s 2018 and later MY ZEV standards represent a reasonable pathway to reach these longer term goals. Under EPA’s traditional practice of affording CARB the broadest discretion possible, and deferring to CARB on its policy choices, we believe there is a rational connection between California ZEV standards and its attainment of long term air quality goals. Whether or not the ZEV standards achieve additional reductions by themselves above and beyond the LEV III GHG and criteria pollutant standards, the LEV III program overall does achieve

<sup>185</sup> 49 FR at 18887, 18890.

<sup>186</sup> *See, e.g.*, S. Rep. No. 403, 90th Cong., 1st Sess. 33 (1967) (The waiver of preemption is for California’s “unique problems and pioneering efforts.”); 113 Cong. Rec. 30950, 32478 (“[T]he State will act as a testing agent for various types of controls and the country as a whole will be the beneficiary of this research.”) (Statement of Sen. Murphy).

<sup>187</sup> *Ford Motor Co., v. EPA*, 606 F.2d 1293, 1300 (D.C. Cir. 1979).

<sup>188</sup> 74 FR at 32763–65; 76 FR 34693; 79 FR 46256; 81 FR 95982.

The only other exception to the application of the traditional interpretation was in SAFE 1, when EPA again used a standard-specific level of review and focused on California's need for GHG standards at issue under the waiver. There, EPA posited that section 209(b)(1)(B) called for a "particularized nexus" for California's motor vehicle standards: "Congress enacted the waiver authority for California under section 209(b) against the backdrop of traditional, criteria pollutant environmental problems, under which all three links in this chain bear a particularized nexus to specific local California features: (1) Criteria pollutants are emitted from the tailpipes of the California motor vehicle fleet; (2) those emissions of criteria pollutants contribute to air pollution by concentrating locally in elevated ambient levels, which concentration, in turn; (3) results in health and welfare effects (e.g., from ozone) that are extraordinarily aggravated in California as compared to other parts of the country, with this extraordinary situation being attributable to a confluence of California's peculiar characteristics, e.g., population density, transportation patterns, wind and ocean currents, temperature inversions, and topography."<sup>195</sup> As support for the nexus test, EPA, for the first time in waiver decisions, relied on section 202(a) and its own terms of authority to inform interpretation of the second waiver prong.<sup>196</sup> In addition, EPA relied on legislative history to interpret "compelling and extraordinary" conditions as a reference to "peculiar local conditions" and "unique problems" in California.<sup>197</sup>

such reductions, and EPA defers to California's policy choice of the appropriate technology path to pursue to achieve these emissions reductions." (footnote omitted).

<sup>195</sup> 84 FR at 51339.

<sup>196</sup> *Id.* at 51339–40.

<sup>197</sup> *Id.* at 51342 (quoting S. Rep. No. 403, 90th Cong. 1st Sess., at 32 (1967)) ("Congress discussed 'the unique problems faced in California as a result of its climate and topography.' H.R. Rep. No. 728, 90th Cong. 1st Sess., at 21 (1967). See also Statement of Cong. Holifield (CA), 113 Cong. Rec. 30942–43 (1967). Congress also noted the large effect of local vehicle pollution on such local problems. See, e.g., Statement of Cong. Bell (CA) 113 Cong. Rec. 30946. As explained at proposal, Congress focus was on California's ozone problem, which is especially affected by local conditions and local pollution. See Statement of Cong. Smith (CA) 113 Cong. Rec. 30940–41 (1967); Statement of Cong. Holifield (CA), *id.*, at 30942. See also, MEMA I, 627 F.2d 1095, 1109 (D.C. Cir. 1979) (noting the discussion of California's 'peculiar local conditions' in the legislative history). In sum and as explained at proposal, conditions that are similar on a global scale are not 'extraordinary,' especially where 'extraordinary' conditions are a predicate for a local deviation from national standards, under section 209(b). 83 FR 43247.'").

Accordingly, EPA reasoned that California must demonstrate "compelling and extraordinary circumstances sufficiently different from the nation as a whole to justify standards on automobile emissions which may, from time to time, need to be more stringent than national standards."<sup>198</sup>

In SAFE 1, EPA then posited that the nexus test should be applied to California's GHG standards specifically, rather than California's program "as a whole" under the traditional "aggregate" approach, "to ensure that such standard is linked to local conditions that giv[e] rise to the air pollution problem, that the air pollution problem is serious and of a local nature, and that the State standards at issue will meaningfully redress that local problem."<sup>199</sup> As support for the GHG-specific scrutiny, EPA reasoned that "[t]he Supreme Court's opinion in *UARG v. EPA*, 134 S. Ct. 2427 (2014), instructs that Clean Air Act provisions cannot necessarily rationally be applied identically to GHG as they are to traditional pollutants."<sup>200</sup>

Applying the nexus test, EPA concluded that California did not need its GHG standards to meet "compelling and extraordinary conditions" because they were missing a particularized nexus to specific local features. EPA in the alternative posited that "even if California does have compelling and extraordinary conditions in the context of global climate change, California does not 'need' these standards under section 209(b)(1)(B) because they will not meaningfully address global air pollution problem of the sort associated with GHG emissions."<sup>201</sup> EPA also dismissed the 2009 GHG waiver conclusion on deleterious effects of GHG emissions on ozone (e.g., how increases in ambient temperature are conducive to ground-level ozone formation), stating that such a relationship "does not satisfy this requirement for a particularized nexus, because to allow such attenuated effects to fill in the gaps would eliminate the function of requiring such a nexus in the first place."<sup>202</sup>

#### B. Notice of Reconsideration of SAFE 1 and Request for Comment

In the Notice of Reconsideration of SAFE 1, EPA noted its interest in any new or additional information or comments regarding whether it

appropriately interpreted and applied section 209(b)(1)(B) in SAFE 1. The Agency noted that EPA's finding in SAFE 1, that such standards were only designed to address climate change and a global air pollution problem, led EPA to a new interpretation of section 209(b)(1)(B). EPA solicited views on whether it was permissible to construe section 209(b)(1)(B) as calling for a consideration of California's need for a separate motor vehicle program where criteria pollutants are at issue as well as California's specific standards where GHG standards are at issue.

The Notice of Reconsideration also set forth that EPA's decision to withdraw the ACC program waiver as it relates to California's ZEV sales mandate was based on the same new interpretation and application of the second waiver prong and rested heavily on the conclusion that California only adopted the ZEV sales mandate requirement for purposes of achieving GHG emission reductions. EPA recognized that this conclusion in turn rested solely on a specific reading of a single sentence in CARB's ACC program waiver request.<sup>203</sup> EPA requested comment on these specific conclusions and readings as well as whether the withdrawal of the ACC program waiver, within the context of California's environmental conditions and as applied to the GHG standards and ZEV sales mandate requirement, was permissible and appropriate.

#### C. Comments Received

EPA received multiple comments on its decision to evaluate California's need for its GHG standards separate from its need for a separate motor vehicle emission program as a whole. Some commenters agreed that EPA could evaluate waiver requests for the specific GHG standards under the waiver along the lines of the Agency's pronouncements in SAFE 1. Additionally, commenters pointed to the method of EPA's review in SAFE 1—evaluating the standards individually, as they are received, rather than in the aggregate—as evidence of the flaw in the traditional interpretation.<sup>204</sup> Some commenters also echoed SAFE 1's concern that "once EPA had determined that California needed its very first set of submitted standards to meet extraordinary and compelling conditions, EPA would never have the

<sup>198</sup> *Id.*

<sup>199</sup> *Id.* at 51345.

<sup>200</sup> *Id.* at 51340.

<sup>203</sup> *Id.* at 51330 ("Regarding the ACC program ZEV mandate requirements, CARB's waiver request noted that there was no criteria emissions benefit in terms of vehicle (tank-to-wheel—TTW) emissions because its LEV III criteria pollutant fleet standard was responsible for those emission reductions.'").

<sup>204</sup> CEI at 13–14.

discretion to determine that California did not need any subsequent standards.”<sup>205</sup>

Under this analysis of the specific standards at issue under the waiver, these commenters continued, California could not demonstrate that its GHG and ZEV standards were, on their own, compelling and extraordinary. These commenters agreed with SAFE 1’s “particularized nexus” interpretation of “compelling and extraordinary,” arguing that the words required unique consequences in order to give adequate meaning to the words themselves and in order to overcome equal sovereignty implications.<sup>206</sup> Using this interpretation, these commenters concluded that, because “GHG concentrations are essentially uniform throughout the globe, and are not affected by California’s topography and meteorology,” and because the entire nation would be affected by climate change, neither the effects of the regulations on climate change, nor the impacts of climate change on California could be considered “compelling and extraordinary.”<sup>207</sup> Some commenters also argued that these standards were unnecessary given California’s “deemed to comply” provision, which would theoretically allow all automobile manufacturers to comply with California’s standards by meeting the less stringent Federal GHG standards.<sup>208</sup>

In contrast, other commenters asked that EPA reverse its SAFE 1 section 209(b)(1)(B) determination by reverting to EPA’s long-standing “program-level” approach to the “need” inquiry, where “EPA considers California’s need for its own mobile-source-emissions program as a whole, not whether California needs a particular standard for which it has requested a waiver.”<sup>209</sup> These

commenters noted the long tradition of interpreting California’s need in the aggregate, an interpretation that SAFE 1 acknowledged was reasonable.<sup>210</sup> This interpretation, they argued, best aligned with the text, legislative history, and purpose of the waiver program.<sup>211</sup> For example, some commenters argued that, because feasibility was evaluated under an aggregate approach, it would be unreasonable for California’s need for the program to be evaluated under a more restrictive approach.<sup>212</sup> These commenters also argued that Congress had expressed approval of this aggregate approach, citing legislative history from 1977 and 1990.<sup>213</sup> This approach, they continued, aligns with the Waiver Program’s broad deference to California to create an entire regulatory program, which is comprised of regulations that interact with and affect each other.<sup>214</sup> One commenter also responded directly to the question EPA posed in its Notice of Reconsideration, whether it was “permissible for EPA to construe section 209(b)(1)(B) as calling for consideration of California’s need for a separate motor vehicle program where criteria pollutants are at issue and consideration of California’s individual standards where GHG standards are at issue.”<sup>215</sup> According to the commenter, “The Supreme Court has rejected this ‘novel interpretive approach’ of assigning different meanings to the same statutory text in the same provision, depending on the application, because it ‘would render every statute a chameleon.’”<sup>216</sup>

<sup>210</sup> Twelve Public Interest Organizations at 7 (“The Trump EPA in turn acknowledged that this longstanding interpretation of Section 209(b)(1)(B) was a reasonable one, 84 FR at 51,341 . . .”).

<sup>211</sup> States and Cities at 22 (citing 84 FR at 51341); Tesla at 11 (“The plural reference to ‘such State standards’ requires that the standards be considered in the aggregate as a group. This language stands in stark contrast to alternate phrasing that was available to Congress and that would have permitted a non-aggregate determination, such as: ‘such State does not need a State standard to meet compelling and extraordinary conditions.’ Indeed, alternative language referencing individual standards is present in subsection (b)(2), which references ‘each State standard.’”).

<sup>212</sup> States and Cities at 25–26; Twelve Public Interest Organizations at 8 (“An aggregate approach to the consistency inquiry also makes sense under Section 209(b)(1)(C) because technological feasibility is effectively evaluated on a program basis. The feasibility of a new standard cannot be evaluated on its own if there are interactions with pre-existing standards. Such interactions between standards are what prompted Congress to add the “in the aggregate” phrase to section 209 in the first place.”).

<sup>213</sup> States and Cities at 26–27; Ozone Transport Commission (OTC), Docket No. EPA–HQ–OAR–2021–0257–0283 at 4.

<sup>214</sup> States and Cities at 27–28.

<sup>215</sup> 86 FR at 22429.

<sup>216</sup> States and Cities at 24 (quoting *Clark v. Martinez*, 543 U.S. 371, 382 (2005) and citing *U.S. v. Santos*, 553 U.S. 507, 522 (2008); *U.S. Dep’t of*

These commenters also asked EPA to revert to the traditional interpretation of “compelling and extraordinary” instead of SAFE 1’s “particularized nexus” formulation. Commenters noted the SAFE 1 requirement appears nowhere in the text of the statute.<sup>217</sup> Because of this absence, they continued, EPA’s references to the legislative history from 1967 have no “tether” to the statutory text and cannot justify the nexus requirement.<sup>218</sup> Further, commenters argued that EPA’s reliance on the equal sovereignty doctrine improperly informed how EPA should interpret the phrase “compelling and extraordinary conditions” in the second waiver prong, and therefore requiring such conditions to be sufficiently different or unique among states, was inappropriate.<sup>219</sup> Commenters argued that the equal sovereignty doctrine was inapplicable to the second waiver prong. They explained that the Supreme Court has only applied the “rarely invoked” doctrine of equal sovereignty in the “rare instance where Congress undertook ‘a drastic departure from basic principles of federalism’ by authorizing ‘federal intrusion into sensitive areas of state and local policymaking.’”<sup>220</sup> Congress’s exercise of its Commerce Clause power in regulating air pollution from new motor vehicles, commenters continued, is not such an “intrusion.” Moreover, they wrote, applying the equal sovereignty doctrine in this instance would actually “diminish most States’ sovereignty” because it would “reduce the regulatory options available to California and to other [section 177] States.” This diminished sovereignty, they argued, would not “enhance[e] the sovereignty of any State” or “alleviate” any unjustified burden because “Section 209(b)(1) imposes no such burden.”<sup>221</sup>

*the Treasury v. FLRA*, 739 F.3d 13,21 (D.C. Cir. 2014)). The commenter notes that in the SAFE 1 brief, EPA claimed that its new approach to section 209(b)(1)(B) would apply “for all types of air pollutants” but EPA could point to nowhere in SAFE 1 decision where this was said. *Id.* at 25. And “only two sentences later,” EPA acknowledged that its review under this second prong would change “depending upon which ‘air quality concerns’ were implicated.” *Id.*

<sup>217</sup> States and Cities at 34 (noting the lack of the words “nexus,” “particularized,” “peculiar,” and “local” anywhere in sections 209(b) or 202(a)(1)).

<sup>221</sup> *Id.* at 43; Twelve Public Interest Organizations at 5 (“Clean Air Act Section 209(b) places no extraordinary burden or disadvantage on one or more States. Rather, the statute benefits California by allowing the exercise of its police power authority to address its particular pollution control needs”).

<sup>205</sup> 84 FR at 51341. See, e.g., NADA at 5; Urban Air at 25, 29–33; AFPM at 22–23.

<sup>206</sup> AFPM at 12; Urban Air at 4.

<sup>207</sup> CEI at 14–16 (“The resulting “global pool” of GHG emissions is not any more concentrated in California than anywhere else . . . [E]ven if one assumes “compelling and extraordinary conditions” can refer to climate change impacts, such as heat waves, drought, and coastal flooding, California’s vulnerability is not “sufficiently different” from the rest of the nation to merit waiving federal preemption of state emission standards. Thus, California is not “extraordinary” in regard to either the “causes” of the “effects” of global climate change.”); NADA at 5 (“while vehicle GHG emissions also were, by definition, local, their impact on serious local air quality concerns could not be shown.”); AFPM at 11–14 (“Neither the causes nor effects of GHG emissions are compelling and extraordinary conditions, as they are global rather than local conditions, and California’s GHG standards and ZEV mandate will not meaningfully address the causes or effects of these GHG emissions.”).

<sup>208</sup> NADA at 4–5; Urban Air at 33.

<sup>209</sup> States and Cities at 22 n.16.

Similarly, commenters rebutted SAFE 1's use of words like "peculiar" and "unique" to further define "compelling and extraordinary." These words, they noted, appear nowhere in the text of section 209(b)(1)(B) and do not align with the plain meaning of the word "extraordinary."<sup>222</sup> Further, they argued, this narrow interpretation "would render the waiver provision unworkable" as, "for any given air pollutant, it is possible to identify other areas of the country that suffer from a similar pollution problem."<sup>223</sup> In fact, they continued, this argument was rejected in the 1967 legislative history and in 1984, "when EPA thoroughly rebutted the assertion that California could not receive a waiver if individual pollutant levels were 'no worse than some other areas of the country.'"<sup>224</sup> Moreover, they argued, the existence of section 177 necessarily acknowledges that other states may have the same or similar air pollution problems as California.<sup>225</sup>

Other commenters argued that California needed GHG standards to address "compelling and extraordinary" conditions in California even under the SAFE 1 interpretation of the second waiver prong. These commenters argued that GHG and ZEV standards produce both GHG and criteria pollution benefits, pointing to language in the ACC program waiver that acknowledged these dual benefits and to subsequent SIP approvals that incorporated the California standards in order to achieve criteria emission reductions.<sup>226</sup> In

<sup>222</sup> States and Cities at 38–39 (explaining that the existence of those words in the legislative history "simply highlight that Congress did not codify [them] in Section 209(b)(1)(B)" and that plain meaning of "extraordinary" is "out of the ordinary"); Twelve Public Interest Organizations app. 1 at 49 ("Congress understood, even in 1967, that '[o]ther regions of the Nation may develop air pollution situations related to automobile emissions which will require standards different from those applicable nationally.' <sup>226</sup> States and Cities at 9–14, 30–31; Center for Biological Diversity, Docket No. EPA–HQ–OAR–2021–0257–0358 at 2 ("The Trump EPA improperly separated California's need for greenhouse gas regulations from its need for criteria pollutant standards. In reality, these two goals are tightly linked, and both are critical to the Clean Air Act's goals of safeguarding public health and welfare."); San Joaquin Valley Air Pollution Control District (SJVAPCD), Docket No. EPA–HQ–OAR–2021–0257–0105 at 3 ("The District's 2016 Plan for the 2009 9-Hour Ozone Standard adopted June 16, 2016, and 2018 Plan for the 1997, 2006, and 2012 PM 2.5 Standards, adopted November 15, 2018, both rely on emission reductions from California's Advanced

particular, commenters explained that the 2012 California waiver request established that the ZEV standard would reduce criteria pollution both "by reducing emissions associated with the production, transportation, and distribution of gasoline" and "by driving the commercialization of zero-emission-vehicle technologies necessary to reduce future emissions and achieve California's long-term air quality goals."<sup>227</sup> As for the GHG standards, commenters noted that, as acknowledged in the ACC program waiver, "global warming exacerbates criteria pollution and makes it harder to meet air pollution standards."<sup>228</sup> Thus, they argue, "EPA expressly and improperly limited its Determination to consideration of the 'application of section 209(b)(1)(B) to California's need for a GHG climate program.'" <sup>229</sup> Given EPA's consistent acceptance that "California's criteria pollution 'conditions' are 'extraordinary and

Clean Cars regulation and other mobile source measures to support the Valley's attainment of the federal health-based NAAQS."); NCAT at 11 ("In addition, California's ZEV standards are intended to and do achieve significant incremental reductions of NOx and other non-GHG emissions."); Tesla at 10–11 ("In comments submitted to the EPA in 2009 regarding a preemption waiver, [California] explained that it 'specifically designed its GHG standards for criteria pollutants.' It also emphasized that it has 'frequently referenced the science to support GHG standards as a necessary method for controlling ozone and particulate matter pollution' and has 'consistently recognized that the State's ability to reduce nonattainment days for ozone and wildfire-caused particulate matter depends on its ability to reduce GHG emissions. . . . EPA also has repeatedly expressed its own understanding that GHG standards should be viewed as a strategy to help control criteria pollutants to address National Ambient Air Quality Standards nonattainment."); Twelve Public Interest Organizations at 5 ("For example, atmospheric heating due to global warming can increase the production of ground-level ozone in California, which suffers from extraordinary amounts of locally reacting nitrogen oxides and volatile organic compounds.").

<sup>227</sup> Center for Biological Diversity at 2–3. In contrast, some commenters, echoing SAFE 1, argued that these upstream emission benefits should not be considered in determining the criteria pollutant benefits of these standards. CEI at 16 ("Although NHTSA and EPA are required to consider all relevant factors when determining CAFE and tailpipe CO2 standards, it is inappropriate to elevate stationary source criteria pollutant emissions into a make-or-break factor in waivers for mobile source programs. The Clean Air Act already provides the EPA with ample authorities to regulate stationary sources, including the NAAQS program, New Source Performance Standards program, Prevention of Significant Deterioration of Air Quality program, Acid Rain program, and Regional Haze program. If Congress wanted NHTSA's CAFE program and EPA's mobile source program to prioritize reductions of indirect stationary source emissions, it could easily have said so. The indirect effects on stationary source emissions are not even mentioned.").

<sup>228</sup> Center for Biological Diversity at 3.

<sup>229</sup> States and Cities at 28 (citing 84 FR at 51339 (emphasis added)) (limiting section 209(b)(1)(B) consideration to "the case of GHG emissions.").

compelling' and that the record demonstrates that California's GHG and ZEV standards reduce criteria emissions in California," EPA should "reverse its SAFE 1 section 209(b)(1)(B) determination and the waiver withdrawal that rested on it—regardless of whether EPA reverts to its traditional, program-level approach."<sup>230</sup>

Regardless of the emissions benefits of the standards, some commenters argued that California's plan to address both long-term and short-term climate and criteria pollutant reduction goals is entitled to deference. Thus, even if "the mandate truly added nothing to the emission benefits of California's standards for vehicular emissions of criteria and greenhouse gas pollutants," commenters claimed, "the mandate would simply constitute the State's choice of means for automakers to comply with its standards."<sup>231</sup> These commenters further argued that section 209(b)(1)(B) "does not authorize EPA to inquire into whether the means to comply with California emission standards, as opposed to the actual standards themselves, are needed to meet compelling and extraordinary conditions."<sup>232</sup> Commenters also claimed that EPA's argument, that California cannot need the GHG and ZEV standards because those standards alone would not "meaningfully address global air pollution problems" posed by climate change, "lacks merit" and "is illogical."<sup>233</sup> Such an approach, they

<sup>230</sup> States and Cities at 29. The commenter notes that EPA never considered whether California needed those criteria emission reductions from its ZEV and GHG standards because it refused to consider those criteria reductions at all: "EPA attempted to justify disregarding record evidence and its own prior findings concerning the criteria emission benefits of these California standards by mischaracterizing CARB's 2012 waiver request. . . . But, having chosen to *sua sponte* reopen the question whether California continues to need standards it has been implementing for six years, . . . EPA could not limit its consideration to what the standards were intended to achieve when they were originally designed or presented. . . . CARB (and others) asserted clearly in SAFE 1 comments that both the GHG and ZEV standards produce criteria pollution benefits upon which California and other States rely to improve air quality." *Id.* at 29–30.

For example, the California legislature has found that global warming will cause adverse health impacts from increased air pollution and a projected doubling of catastrophic wildfires. Many of the state’s most extreme weather events have occurred in the last decade, including a severe drought from 2012–2016, an almost non-existent Sierra Nevada winter snowpack in 2014–2015, three of the five deadliest wildfires in state history, and back-to-back years of the warmest average temperatures on record. These ongoing disasters demonstrate California’s status as ‘one of the most ‘climate-challenged’ regions of North America.’”).

*D. Analysis: California Needs the ACC Program GHG Standards and ZEV Sales Mandate To Address Compelling and Extraordinary Conditions Under Section 209(b)(1)(B)*

In this action, EPA first finds that the Agency should not have reinterpreted section 209(b)(1)(B) in evaluating California’s “need” for GHG standards and ZEV sales mandate requirements at issue. The analysis below walks through the statutory language and history associated with this provision. As part of this discussion, the relationship of this provision and California’s authority and deference is highlighted. The two interpretations of the waiver prong are then reviewed, presenting the Agency’s rationale for its findings of the inappropriate SAFE 1 interpretation and support for its conclusion about the better interpretation. Second, as shown below, the factual record before the Agency at the time of SAFE 1 supports the GHG standards and ZEV sales mandate requirements at issue under either the traditional or SAFE 1 interpretation of section 209(b)(1)(B).

1. EPA Is Withdrawing the SAFE 1 Section 209(b)(1)(B) Interpretation

Except for two short-lived exceptions in the context of the 2008 waiver denial and SAFE 1, EPA has consistently recognized that reading the “needs” test of the second waiver prong as calling for a standard-specific evaluation would be inconsistent with congressional intent given the text of section 209(b)(1) legislative history, as well as the way the different standards in the ACC program work together to reduce criteria and GHG pollution and spur innovation. As further explained below, all of these aspects lend support to the Agency practice of not subjecting California’s waiver requests to review of the specific standards under the second waiver prong, and we agree that the traditional interpretation of section 209(b) is, at least, the better interpretation.

Under section 209(b)(1)(B), EPA must grant a waiver request unless the Agency finds that California “does not need such State standards to meet compelling and extraordinary conditions.” EPA has historically read the phrase “such State standards” in section 209(b)(1)(B) as referring back to standards “in the aggregate” in section 209(b)(1), which addresses the protectiveness finding that California must make for its waiver requests. In addition, as EPA has explained in the past, reading the provision otherwise would conflict with Congress’s 1977 amendment to the waiver provision to allow California’s standards to be “at

least as protective” as the federal standards “in the aggregate.” This amendment must mean that some of California’s standards may be weaker than federal standards counterbalanced by others that are stronger. If, however, a waiver can only be granted if each standard on its own meets a compelling need, then California could never have a standard that is weaker than the federal standard, rendering Congress’s 1977 amendment inoperative. Congress would not have created the option for California’s individual standards to be at least as protective “in the aggregate” and then taken that option away in the second waiver prong’s “compelling need” inquiry.

In addition, EPA has reasoned that giving effect to section 209(b)(1) means that both subparagraph (b)(1)(B) and paragraph (b)(1) must be read together such that the Agency reviews the same standards that California considers in making its protectiveness determination. “§ 209 (formerly § 208) was amended to require the U.S. Environmental Protection Agency (EPA) to consider California’s standards as a package, so that California could seek a waiver of preemption if its standards ‘in the aggregate’ protected public health at least as well as federal standards.”<sup>238</sup>

EPA has thus explained the reasoning for the reading of “such State standards” for instance, as follows:

[I]f Congress had intended a review of the need for each individual standard under (b)(1)(B), it is unlikely that it would have used the phrase “. . . does not need such state standards,” which apparently refers back to the phrase “State standards . . . in the aggregate,” as used in the first sentence of section 209(b)(1), rather than to the particular standard being considered. The use of the plural, *i.e.*, “standards,” further confirms that Congress did not intend EPA to review the need for each individual standard in isolation.<sup>239</sup>

EPA has also explained that “to find that the ‘compelling and extraordinary conditions’ test should apply to each pollutant would conflict with the amendment to section 209 made in 1977 allowing California to select standards ‘in the aggregate’ at least as protective as federal standards. In enacting that change, Congress explicitly recognized that California’s mix of standards could include some less stringent than the corresponding federal standards.”<sup>240</sup> This is in accord with *MEMA I*, where the D.C. Circuit explained that:

The intent of the 1977 amendment was to accommodate California’s particular concern

<sup>238</sup> *Motor Vehicle Mfrs. Ass’n v. NYS Dep’t of Env’t Conservation*, 17 F.3d 521, 525 (2d Cir. 1994).

<sup>239</sup> 49 FR at 18890.

<sup>240</sup> *Id.* at 18890 n.24.

with oxides of nitrogen, which the State regards as a more serious threat to public health and welfare than carbon monoxide. California was eager to establish oxides of nitrogen standards considerably higher than applicable federal standards, but technological developments posed the possibility that emission control devices could not be constructed to meet both the high California oxides of nitrogen standard and the high federal carbon monoxide standard.<sup>241</sup>

EPA has further explained that the crucial consequence of the 1977 Amendment was to require waiver grants for California's specific standards that are part of the State's overall approach to reducing vehicle emissions to address air pollution even if those specific standards might not be needed to address compelling and extraordinary conditions.<sup>242</sup> For instance, EPA has previously granted a waiver for what was then described as "harmless emissions constituents such as methane" while reminding objectors of "EPA's practice to leave the decisions on controversial matters of public policy, such as whether to regulate methane emissions, to California."<sup>243</sup> Similarly, in the 1984 p.m. standards waiver decision, EPA also discussed California's "need" for its own standards at length in response to comments that California must have worse air quality problems than the rest of the country to qualify for a waiver.<sup>244</sup> There, EPA explained that California need not "have a 'unique' particulate problem, *i.e.*, one that is demonstrably worse than in the rest of the country [because], there is no indication in the language of section 209 or the legislative history that California's pollution problem must be the worst in the country, for a waiver to be granted."<sup>245</sup> Indeed, the word "unique" is not contained in the statutory provision. EPA further explained that "even if it were true that California's total suspended particulate problem is, as certain manufacturers argue, no worse than some other areas of the country, this does not mean that diesel

particulates do not pose a special problem in California."<sup>246</sup>

As explained at length earlier, EPA believes Congress intended the Agency to grant substantial deference to California on its choice of standards that are appropriate to meet its needs. EPA has explained that "Congress has made it abundantly clear that the manufacturers would face a heavy burden in attempting to show 'compelling and extraordinary conditions' no longer exist: The Administrator, thus, is not to overturn California's judgment lightly. Nor is he to substitute his judgment for that of the State. There must be "clear and compelling evidence that the State acted unreasonably in evaluating the relative risks of various pollutants in light of the air quality, topography, photochemistry, and climate in that State, before EPA may deny a waiver."<sup>247</sup> Likewise, the House Committee Report explained for instance that "[t]he [1977] amendment is intended to ratify and strengthen the California waiver provision and to affirm the underlying intent of that provision, *i.e.*, to afford California the *broadest possible discretion* in selecting the best means to protect the health of its citizens and the public welfare."<sup>248</sup> EPA's past practice prior to SAFE 1, except for one instance, was consistent with this deferential stance.

In enacting section 209(b)(1), Congress struck a deliberate balance first in 1967 when it acknowledged California's serious air quality problems as well as its role as a laboratory for emissions control technology for the country,<sup>249</sup> and again, in the 1977 Amendments that allowed for California to seek and obtain waivers for standards that are less stringent than the federal standards (by amending section

<sup>246</sup> *Id.*

<sup>247</sup> *Id.* at 18890 n.25 (citing H.R. Rep. No. 95–294, 95th Cong., 1st Sess. 302 (1977)).

<sup>248</sup> *MEMA I*, 627 F.2d at 1110 (citing H.R. Rep. No. 294, 95th Cong., 1st Sess. 301–02 (1977)) (emphasis added). Congress amended section 209(b)(1)(A) so that California's determination that its standards are as at least as protective as applicable Federal standards so that such determination may be done "in the aggregate" looking at the summation of the standards within the vehicle program.

<sup>249</sup> The CAA has been a paradigmatic example of cooperative federalism, under which "States and the Federal Government [are] partners in the struggle against air pollution." *General Motors Corp. v. United States*, 496 U.S. 530, 532 (1990). Motor vehicles "must be either 'federal cars' designed to meet the EPA's standards or 'California cars' designed to meet California's standards." *Engine Mfrs.*, 88 F.3d at 1079–80, 1088 ("Rather than being faced with 51 different standards, as they had feared, or with only one, as they had sought, manufacturers must cope with two regulatory standards."). See also *MEMA II*, 142 F.3d at 463.

209(b)(1)(A)) and also added section 177 to acknowledge that states may have air quality problems similar to California's by allowing states, subject to certain conditions, to adopt California's new motor vehicle standards once waived by EPA.<sup>250</sup> These provisions struck a balance between having only one national standard and having 51 different state standards by settling on two standards—a federal one and a California one that other states may also adopt. Since 1967, in various amendments to section 209, Congress has also not disturbed this reading of section 209(b)(1)(B) as calling for the review of the standards as a whole program. Likewise, Congress has also not placed any additional constraints on California's ability to obtain waivers beyond those now contained in section 209(b)(1). The Agency has thus viewed the text, legislative history, and structure of section 209(b)(1) as support for the program-level review of waiver requests as well for the conclusion that California's air quality need not be worse than the rest of the country for EPA to grant a waiver of preemption. In addition, to the extent that SAFE 1 was intended to preclude California's regulation of all greenhouse gases from light-duty vehicles, the SAFE 1 interpretation creates a structural conflict within the relevant CAA provisions and could also create an inability for California to address GHG emissions and its contribution to the serious air quality problems within the State. There is a fundamental relationship between sections 209(a) and 209(b). Section 209(a) preempts states from adopting or enforcing new motor vehicle emission standards, and section 209(b) calls for EPA to waive that preemption for California vehicular emission standards unless EPA finds that one or more of the waiver criteria set out therein are not met. Nothing on the face of the CAA or applicable legislative history indicates that the scope of section 209(b)—the pollutants for which California may obtain a waiver—is more limited than the scope of section 209(a).<sup>251</sup> The D.C. Circuit has

<sup>250</sup> "§ 177 . . . permitted other states to 'piggyback' onto California's standards, if the state's standards 'are identical to the California standards for which a waiver has been granted for such model year.'" *Motor Vehicle Mfrs. Ass'n v. New York State Dep't of Envtl. Conservation*, 17 F.3d 521, 525 (2d Cir. 1994).

<sup>251</sup> EPA believes that, to the extent the SAFE 1 interpretation has the practical effect of defining or implementing the scope of section 209(b) differently depending on the pollutants involved, the interpretation is contrary to legislative intent and the Agency's historic practice given the criteria emission benefits of CARB's GHG emission

<sup>241</sup> *MEMA I*, 627 F.2d 1095, 1110 n.32 (D.C. Cir. 1979).

<sup>242</sup> 74 FR at 32761 ("Congress decided in 1977 to allow California to promulgate individual standards that are not as stringent as comparable federal standards, as long as the standards are 'in the aggregate, at least as protective of public health and welfare as applicable federal standards.'"); "[T]he 1977 amendments significantly altered the California waiver provision." *Ford Motor Co.*, 606 F.2d 1293, 1302 (D.C. Cir. 1979).

<sup>243</sup> 43 FR at 25735.

<sup>244</sup> It bears note that these are the same kinds of comments that EPA received in the context of the ACC program waiver proceedings on California's need for GHG standards.

<sup>245</sup> 49 FR at 18891.

already held as much as to section 209(a): “whatever is preempted [by section 209(a)] is subject to waiver under subsection (b).”<sup>252</sup> As demonstrated by EPA’s review of the record in this decision, California’s GHG emission standards at issue meet the SAFE 1 interpretation of the second waiver prong. Nevertheless, to the extent that SAFE 1 was intended to preclude all California regulation of greenhouse gases, EPA believes it improper to exclude entirely a pollutant from a waiver under section 209(b) that is otherwise preempted by section 209(a).

In addition, Congress has cited California’s GHG standards and ZEV sales mandate in subsequent legislation. Federal procurement regulations direct the EPA to issue guidance identifying the makes and models numbers of vehicles that are low GHG emitting vehicles.<sup>253</sup> In a clear reference to California’s motor vehicle GHG standards, Congress has required EPA when identifying those vehicles to “take into account the most stringent standards for vehicle greenhouse gas emissions applicable to and enforceable against motor vehicle manufacturers for vehicles sold anywhere in the United States.”<sup>254</sup> And in its State Implementation Plan provision regarding fleet programs required for certain non-attainment areas relating to issuing credits for cleaner vehicles, Congress stated that the “standards established by the Administrator under this paragraph . . . shall conform as closely as possible to standards which are established for the State of California for ULEV and ZEV vehicles in the same class.”<sup>255</sup> Congress would not likely have adopted California’s standards into its own legislation if it believed those standards to be preempted.

EPA also disagrees with SAFE 1’s related argument that the statutory criteria must be interpreted in the context of the constitutional doctrine of “equal sovereignty.” As explained in detail in Section VIII, waiver requests should be reviewed based solely on the criteria in section 209(b)(1) and the Agency should not consider constitutional issues in evaluating waiver requests.<sup>256</sup> The constitutionality of section 209 is not one of the three statutory criteria for reviewing waiver

standards and ZEV sales requirements as well as the impacts of climate change on California’s local and regional air quality.

<sup>252</sup> *MEMA I*, 627 F.2d 1095, 1106–08 (D.C. Cir. 1979).

<sup>253</sup> 42 U.S.C. 13212(f)(3).

<sup>254</sup> *Id.*

<sup>255</sup> 42 U.S.C. 7586(f)(4).

<sup>256</sup> 78 FR at 2145.

requests. However, because the Agency asserted in SAFE 1 that the equal sovereignty doctrine formed a gloss on its statutory interpretation of the three criteria, EPA addresses that argument here briefly. In short, in SAFE 1, EPA stated that because section 209(b)(1) provides “extraordinary treatment” to California, the second waiver prong should be interpreted to require a “state-specific” and “particularized” pollution problem.<sup>257</sup> But section 177’s grant of authority to other states to adopt California’s standards undermines the notion that the regulatory scheme treats California in an extraordinary manner. Indeed, if section 209(b) is interpreted to limit the types of air pollution that California may regulate, it would diminish the sovereignty of California and the states that adopt California’s standards pursuant to section 177 without enhancing any other state’s sovereignty. Nor does section 209(b) impose any burden on any state. For these reasons, EPA agrees with commenters who argued that the Supreme Court’s decision in *Shelby County* is inapposite. In section 209(b), Congress did not authorize “federal intrusion into sensitive areas of state and local policymaking.”<sup>258</sup> Rather, it underscored a foundational principle of federalism—allowing California to be a laboratory for innovation. Nor is section 209(b) an “extraordinary departure from the traditional course of relations between the States and the Federal Government.”<sup>259</sup> To the contrary, it is just one of many laws Congress passes that treat States differently, and where, as discussed more fully below, Congress struck a reasonable balance between authorizing one standard and authorizing 51 standards in deciding to authorize two. SAFE 1’s invocation of the rarely used equal sovereignty principle as an aid in interpreting the second waiver prong simply does not fit section 209.

SAFE 1 dismissed the Agency’s traditional interpretation of the second waiver prong under which EPA reviews the same standards that California considers in making its protectiveness determination, asserting that the practical implications of reviewing standards in the “aggregate” compared to specific standards presented in a waiver request meant that the Agency would never have the discretion to determine that California did not need any subsequent standards. But nothing in section 209(b)(1)(B) can be read as

<sup>257</sup> 84 FR 51340, 51347.

<sup>258</sup> *Shelby County v. Holder*, 570 U.S. 529, 535, 45 (2013).

<sup>259</sup> *Id.*

calling for scrutinizing the specific California standards under the waiver.<sup>260</sup> Under section 209(b)(1)(B), EPA is to grant a waiver unless California does not need “such State standards” (plural). EPA interprets section 209(b)(1)(B) to refer back to the phrase “in the aggregate” in section 209(b)(1), which was added in the 1977 CAA Amendments when Congress removed the stringency requirements for waiver of California standards allowing instead for standards that are not as stringent as comparable federal standards, so long as the standards were “in the aggregate, at least as protective of public health and welfare as applicable Federal standards.” EPA believes that referring back to section 209(b)(1) is appropriate given that it precedes the language prior to section 209(b)(1)(B) and is in accord with the deference Congress intended by the 1977 Amendments.<sup>261</sup> Conversely, EPA believes that under the SAFE 1 interpretation California would, of necessity, be required to make a protectiveness finding for each of the specific standards, and the Agency believes this would be an inappropriate outcome from SAFE 1. Under the 1977 Amendments, California can “include some less stringent [standards] than the corresponding federal standards.”<sup>262</sup> As previously explained, “Congress could not have given this flexibility to California and simultaneously assigned to the state the seemingly impossible task of establishing that ‘extraordinary and compelling conditions’ exist for each standard.”<sup>263</sup>

SAFE 1 further argued that its interpretation read the use of “such standards” consistently between the second and third waiver prongs,

<sup>260</sup> In the 2009 GHG waiver, and again in the 2013 ACC program waiver, EPA explained that the traditional approach does not make section 209(b)(1)(B) a nullity, as EPA must still determine whether California does not need its motor vehicle program to meet compelling and extraordinary conditions as discussed in the legislative history. Conditions in California may one day improve such that it may no longer have a need for its motor vehicle program, or a program designed for a particular type of air pollution problem, if the underlying specific air pollutant is no longer at issue.

<sup>261</sup> EPA had applied the traditional interpretation of the second waiver prong prior to the 1977 Amendments.

<sup>262</sup> See H.R. Rep. No. 294, 95th Cong., 1st Sess. 302 (1977); “In further amendments to the Act in 1977, § 209 (formerly § 208) was amended to require the U.S. Environmental Protection Agency (EPA) to consider California’s standards as a package, so that California could seek a waiver from preemption if its standards ‘in the aggregate’ protected public health at least as well as federal standards.” *Motor Vehicle Mfrs. Ass’n v. NYS Dep’t of Env’t Conservation*, 17 F.3d at 525.

<sup>263</sup> 49 FR at 18890 n.24.

sections 209(b)(1)(B) and (C).<sup>264</sup> It is true that section 209(b)(1)(C) employs the same phrase “such State standards” as employed in section 209(b)(1)(B), and it similarly uses that phrase to refer to standards in the aggregate. Indeed, section 209(b)(1)(C) involves an analysis of feasibility that can take more than the feasibility and impacts of the new standards into account. The feasibility assessment conducted for a new waiver request focuses on the standards in that request but builds on the previous feasibility assessments made for the standards already in the program and assesses any new feasibility risks created by the interaction between the standards in the petition and the existing standards.<sup>265</sup>

In sum, EPA now views as inconsistent with congressional intent the SAFE 1 interpretation, which was a flawed interpretation and also a significant departure from the traditional interpretation under which the Agency reviews California’s need for the same standards as those that the State determines are “in the aggregate” as protective of public health and welfare, under section 209(b)(1).<sup>266</sup> EPA

<sup>264</sup> Section 209(b)(1)(C) provides that no such waiver shall be granted if the Administrator finds that “such State standards and accompanying enforcement procedures are not consistent with section 7521(a) [202(a)] of this title.”

<sup>265</sup> For example, in the 2013 ACC waiver that contains CARB’s LEV III criteria pollutant standards and GHG emission standards, as well as the ZEV sales mandate, EPA assessed information submitted by CARB regarding the technological feasibility, lead time available to meet the requirements, and the cost of compliance and the technical and resource challenges manufacturers face in complying with the requirements to simultaneously reduce criteria and GHG emissions. 78 FR at 2131.

<sup>266</sup> 84 FR at 51345. EPA notes that in SAFE 1 the following rationale was used to interpret both 209(b)(1)(C) and then connect it with 209(b)(1)(B): “[B]ecause both sections 209(b)(1)(B) and (C) employ the term ‘such state standards,’ it is appropriate for EPA to read the term consistently between prongs (B) and (C). Under section 209(b)(1)(C), EPA conducts review of standards California has submitted to EPA for the grant of a waiver to determine if they are consistent with section 202(a). It follows then that EPA must read ‘such state standards’ in section 209(b)(1)(B) as a reference to the same standards in subsection (C).” Although the Agency has not pointed to 209(b)(1)(C) as a basis of statutory construction to support the traditional interpretation of 209(b)(1)(B), EPA nevertheless believes it is supportive. EPA notes that the term “such state standards” in 209(b)(1)(C) allows the Agency, in appropriate circumstances, to review the consistency of CARB’s suite of standards, for a particular vehicle category, with section 202(a). For example, EPA evaluated all of the standards (LEV III criteria pollutant, ZEV sales mandate, and GHG standards) of the ACC program in recognition of the aggregate costs and lead time associated with CARB’s standards as well as technologies that may be employed to meet more than one standard. 78 FR 2131–45. EPA’s assessment under 209(b)(1)(C) is not in practice a standard-by-standard review. EPA believes it appropriate to read the entirety of 209 together, along with its purposes, in order to

believes the traditional interpretation is, at least, the better reading of the statute.

As previously explained, in reviewing waiver requests EPA has applied the traditional interpretation in the same way for all air pollutants, criteria and GHG pollutants alike.<sup>267</sup> In SAFE 1, however, EPA reinterpreted section 209(b)(1)(B) and further set out a particularized nexus test and applied this test separately to GHG standards at issue. SAFE 1 then concluded that no nexus exists for GHG emissions in California.<sup>268</sup> SAFE 1 further posited that California must demonstrate “compelling and extraordinary circumstances sufficiently different from the nation as a whole to justify standards on automobile emissions which may, from time to time, need to be more stringent than national standards.”<sup>269</sup> This has resulted in potentially different practical results depending on whether GHG standards or criteria emission pollutants are at issue, a distinction neither found in nor supported by the text of section 209(b)(1)(B) and legislative history. Specifically, SAFE 1 would have the ACC program MYs 2017–2025 criteria pollutants standards subject to review under the traditional interpretation while GHG standards at issue would be subject to review under the SAFE 1 particularized nexus test or individualized scrutiny.<sup>270</sup> This uneven application is even more irreconcilable given that California’s motor vehicle emission program includes two GHG standards for highway heavy-duty vehicles that EPA previously reviewed under the traditional approach.<sup>271</sup> EPA

properly interpret its components such as 209(b)(1)(B).

<sup>267</sup> 74 FR at 32763–65; 76 FR at 34693; 79 FR at 46256; 81 FR at 95982.

<sup>268</sup> SAFE 1 also relied on *UARG v. EPA*, 134 S. Ct. 2427 (2014), where the Supreme Court disagreed with the Agency’s decision to regulate all sources of GHG under Titles I and V as the consequence of the Agency’s section 202(a) endangerment finding for motor vehicle GHG emissions. In EPA’s view upon reconsideration of SAFE 1, *UARG* is distinguishable because here the Agency is acting under a specific exemption to section 202(a) that allows for California to set its own standards for motor vehicle GHG standards under California state law, and thus, regulate major sources of GHG emissions within the State. California’s authority to promulgate standards is neither contingent nor dependent on the Agency’s section 202(a) endangerment finding for GHG. *See* 74 FR at 32778–80; 79 FR at 46262. Moreover, as discussed above, EPA’s waiver authority under section 209(b) is coextensive with preemption under section 209(a). *See MEMA I*, 627 F.2d at 1107. *UARG* is inapplicable to the scope of preemption under section 209(a).

acknowledges that ascribing different meanings to the same statutory text in the same provision here, depending on its application, “would render every statute a chameleon.”<sup>272</sup> Nothing in either section 209 or the relevant legislative history can be read as calling for a distinction between criteria pollutants and GHG standards and thus, the individualized scrutiny under the SAFE 1 particularized nexus test.<sup>273</sup> Nothing in section 209(b) can be read as calling for EPA to waive preemption only if California seeks to enforce criteria pollutant standards. The Administrator is required to waive the preemption in section 209(a) unless California “does not need *such State standards to meet compelling and extraordinary conditions.*”<sup>274</sup> This is in stark contrast to, for example, section 211(c)(4)(C), which calls for a waiver of preemption only if a state demonstrates that a fuel program is “necessary” to achieve the NAAQS.<sup>275</sup> Moreover, as previously noted, “[I]f Congress had intended a review of the need for each individual standard under (b)(1)(B), it is unlikely that it would have used the phrase “. . . does not need *such state standards*” (emphasis in original), which apparently refers back to the phrase “State standards . . . in the aggregate as used in the first sentence of section 209(b)(1), rather than the particular standard being considered.”<sup>276</sup> EPA has also explained that an individualized review of standards would mean that Congress “g[ave] flexibility to California and simultaneously assigned to the state the seemingly impossible tasks of establishing that ‘extraordinary and compelling conditions’ exist for each less stringent standard.”<sup>277</sup>

The second HD GHG emissions standard waiver related to CARB’s “Phase I” regulation for 2014 and subsequent model year tractor-trailers. 81 FR 95982 (December 29, 2016).

<sup>272</sup> *See* States and Cities at 24 (quoting *Clark v. Martinez*, 543 U.S. 371, 382 (2005) and citing *U.S. v. Santos*, 553 U.S. 507, 522 (2008); *U.S. Dep’t of the Treasury v. FLRA*, 739 F.3d 13, 21 (D.C. Cir. 2014)). The commenter notes that in the SAFE 1 brief, EPA claimed that its new approach to section 209(b)(1)(B) would apply “for all types of air pollutants” but EPA could point to nowhere in SAFE 1 decision where this was said. *Id.* at 25. And “only two sentences later,” EPA acknowledged that its review under this second prong would change “depending upon which ‘air quality concerns’ were implicated.” *Id.*

<sup>277</sup> *Id.* at 18890 n.24.

Similarly, nothing in either section 209 or legislative history can be read as requiring EPA to grant GHG standards waiver requests only if California's GHG pollution problem is the worst in the country.<sup>278</sup> "There is no indication in either the statute or the legislative history that . . . the Administrator is supposed to determine whether California's standards are in fact sagacious and beneficial."<sup>279</sup> And most certainly, nothing in either section 209 or the legislative history can be read as calling for EPA to draw a comparison between California's GHG pollution problem and the rest of the country (or world) when reviewing California's need for GHG standards. Instead, the crucial consequence of the 1977 Amendment was to require waiver grants for California's specific standards that are part of the State's overall approach to reducing vehicle emissions to address air pollution even if those specific standards might not be needed to address compelling and extraordinary conditions.<sup>280</sup> Thus, "even if it were true that California's [GHG] problem is, . . . no worse than some other areas of the country, this does not mean that [GHG] do not pose a special problem in California."<sup>281</sup> Rather, "EPA's practice [is] to leave the decisions on controversial matters of public policy, such as whether to regulate [GHG] emissions, to California."<sup>282</sup>

In addition, in Title II, Congress established only two programs for control of emissions from new motor vehicles: EPA emission standards adopted under the Clean Air Act and California emission standards adopted under its state law. And states other than California may not "tak[e] any action that has the effect of creating a car different from those produced to meet either federal or California emission standards, a so-called 'third vehicle.'" <sup>283</sup>

As previously explained, and noted in the Notice of Reconsideration, since the grant of the initial GHG waiver request in 2009, the Agency has applied the

<sup>278</sup> *Id.* at 18891.

<sup>280</sup> 74 FR at 32761 ("Congress decided in 1977 to allow California to promulgate individual standards that are not as stringent as comparable federal standards, as long as the standards are 'in the aggregate, at least as protective of public health and welfare as applicable federal standards.');" "[T]he 1977 amendments significantly altered the California waiver provision." *Ford Motor Co.*, 606 F.2d 1293, 1302 (D.C. Cir. 1979).

<sup>281</sup> 49 FR at 18891.

<sup>282</sup> 43 FR at 25735.

<sup>283</sup> *Motor Vehicle Mfrs. Ass'n v. NYS Dep't of Env't Conservation*, 17 F.3d 521, 526, 528 (2d Cir. 1994).

traditional interpretation in granting two additional waivers for CARB's Heavy-Duty Vehicle GHG emission standards and these GHG standards are now part of California's motor vehicle program, but EPA did not address these waivers in SAFE 1.<sup>284</sup> It also bears note that, given the limited analysis and application of the SAFE 1 interpretation of the second waiver prong, it is uncertain whether the traditional interpretation remains otherwise applicable to earlier model year GHG standards under prior waivers. Ambiguity also applies to SAFE 1's interpretation of this prong in respect to all criteria pollutant standards in the ACC program. While SAFE 1 stated it was only applicable to the GHG standards at issue, in at least one instance the Agency indicated that the SAFE 1 interpretation could also be applicable to future evaluation of waiver requests for criteria pollutant standards.<sup>285</sup> This uncertainty between these statements in SAFE 1 further highlights the inappropriateness of the new interpretation of the second prong.

In sum, for the reasons noted above, EPA is withdrawing the SAFE 1 interpretation and reinstating certain aspects of the ACC program waiver that were earlier granted under the traditional interpretation and approach. EPA concludes it erred by not properly evaluating the statutory interpretation of section 209, the associated legislative history including the policy deference that should be afforded to California to address its serious air quality problems and to serve as a laboratory for the country, and because the "need" for a motor vehicle emission program and

<sup>284</sup> 79 FR 46256 (August 7, 2014); 81 FR 95982 (December 29, 2016).

<sup>285</sup> 84 FR at 51341 n.263. "EPA determines in this document that GHG emissions, with regard to the lack of a nexus between their State-specific sources and their State specific impacts, and California's GHG standard program, are sufficiently distinct from criteria pollutants and traditional, criteria pollutant standards, that it is appropriate for EPA to consider whether California needs its own GHG vehicle emissions program. *EPA does not determine in this document and does not need to determine today how this determination may affect subsequent reviews of waiver applications with regard to criteria pollutant control programs.*" (Emphasis added). See also *id.* at 51344 n.268 ("EPA is adopting an interpretation of CAA section 209(b)(1)(B), specifically its provision that no waiver is appropriate if California does not need standards "to meet compelling and extraordinary conditions," similar to the interpretation that it adopted in the 2008 waiver denial but abandoned in the 2009 and 2013 waiver grants, and applying that interpretation to determine to withdraw the January 2013 waiver for California's GHG and ZEV program for model years 2021 through 2025"), and at 51346 ("EPA therefore views this interpretation and application of CAA section 209(b)(1)(B) set forth here as, at minimum, a reasonable one that gives appropriate meaning and effect to this provision.").

related standards within the program are necessarily better viewed as a comprehensive and interrelated effort to address the range of air quality problems facing California.<sup>286</sup> At the same time, EPA notes that the traditional interpretation is reasonable and consistent with the text, structure and congressional intent and purpose of section 209(b) and EPA is thus confirming that the traditional interpretation of section 209(b)(1)(B) was appropriate and is, at least, the better interpretation.<sup>287</sup>

## 2. California Needs the GHG Standards and ZEV Sales Mandate Even Under the SAFE 1 Interpretation

Even if the SAFE 1 interpretation of section 209(b)(1)(B) was appropriate, the record of both the ACC program waiver and SAFE 1 proceeding demonstrate that California has a need for the GHG standards and ZEV sales mandate at issue under the SAFE 1 interpretation as well. The opponents of the waiver (including EPA in SAFE 1) did not meet their burden of proof to demonstrate that California does not need its GHG emission standards and ZEV sales mandate, whether individually or as part of California's motor vehicle emission program, to meet compelling and extraordinary conditions.<sup>288</sup>

<sup>286</sup> As noted previously, in the context of evaluating the "need" for California's motor vehicle emission standards the Agency is informed by the legislative history from 1967 and 1977, whereby California is properly viewed as a laboratory for the country and that its policy decisions on how best to address its serious air quality issues, and that deference on the question of "need" is in order. Therefore, EPA believes it misapplied the concept of deference in the context of the second waiver prong application in SAFE 1. See *e.g.*, 84 FR at 51344 n.268. While EPA believes it appropriate to not defer when it is interpreting its own statute, the Agency nevertheless determines that California's policy choices in term of its "need" in how best to address compelling and extraordinary conditions in California requires deference by the Agency. This is consistent with EPA's longstanding waiver practice and its integration of the legislative history behind section 209. In any event, EPA would reach the same conclusions regarding the second waiver prong even if it did not defer to California regarding the nature of its air quality problems. 86 FR at 74489 ("The 2009 Endangerment Finding further explained that compared with a future without climate change, climate change is expected to increase tropospheric ozone pollution over broad areas of the U.S., including in the largest metropolitan areas with the worst tropospheric ozone problems, and thereby increase the risk of adverse effects on public health (74 FR 66525)."). See also 86 FR at 74492.

<sup>287</sup> "The interpretation that my inquiry under (b)(1)(B) goes to California's need for its own mobile source program is borne out not only by the legislative history, but by the plain meaning of the statute as well." 49 FR at 18890.

<sup>288</sup> EPA notes that by this action it is rescinding the interpretation of section 209(b)(1)(B) as set forth in SAFE 1. Nevertheless, EPA believes it appropriate to address comments received that suggest the SAFE 1 interpretation was not only

As previously explained, the 1977 CAA Amendments allow California to promulgate standards that might not be considered needed to meet compelling and extraordinary circumstances but would nevertheless be part of California's overall approach of reducing vehicle emissions to address air pollution in California.<sup>289</sup> Thus, CARB may now design motor vehicle emission standards, individually, that might sometimes not be as stringent as federal standards but collectively with other standards would be best suited for California air quality problems because under the 1977 Amendments, California can "include some less stringent [standards] than the corresponding federal standards."<sup>290</sup> And EPA is "required to give very substantial deference to California's judgments on this score."<sup>291</sup>

Indeed, as EPA noted in the ACC program waiver, Congress intentionally provided California the broadest possible discretion in adopting the kind of standards in its motor vehicle program that California determines are appropriate to address air pollution problems that exist in California, whether or not those problems are only local or regional in nature, and to protect the health and welfare of its citizens:

Congress did not intend this criterion to limit California's discretion to a certain category of air pollution problems, to the exclusion of others. In this context it is important to note that air pollution problems, including local or regional air pollution problems, do not occur in isolation. Ozone and PM air pollution, traditionally seen as local or regional air pollution problems, occur in a context that to some extent can involve long range transport of this air pollution or its precursors. This long range or global aspect of ozone and PM can have an impact on local or regional levels, as part of the background in which the local or regional air pollution problem occurs.<sup>292</sup>

correct, but that the factual record supported the SAFE 1 withdrawal of the ACC waiver based on this interpretation.

<sup>289</sup> See *Ford Motor Co., v. EPA*, 606 F.2d 1293, 1296–97 (D.C. Cir. 1979); See H.R. Rep. No. 294, 95th Cong., 1st Sess. 302 (1977).

<sup>292</sup> 78 FR at 2128–29. See "Our Changing Climate 2012 Vulnerability & Adaptation to the Increasing Risks from Climate Change in California." Publication # CEC–500–2012–007. Posted: July 31, 2012; available at [https://ucanr.edu/sites/Jackson\\_Lab/files/155618.pdf](https://ucanr.edu/sites/Jackson_Lab/files/155618.pdf) at 4 ("Higher temperatures also increase ground-level ozone levels.

Furthermore, wildfires can increase particulate air pollution in the major air basins of California. Together, these consequences of climate change could offset air quality improvements that have successfully reduced dangerous ozone concentrations. Given this "climate penalty," as it

In the context of implementing section 209(b)(1)(B) and assessing the "need" for California's standards even under the SAFE 1 interpretation, EPA sees no reason to distinguish between "local or regional" air pollutants versus other pollutants that may be more globally mixed. Rather, it is appropriate to acknowledge that all pollutants and their effects may play a role in creating air pollution problems in California and that EPA should provide deference to California in its comprehensive policy choices for addressing them. Again, even if a new interpretation of section 209(b)(1)(B) were appropriate in SAFE 1, and EPA believes it is not, it is important to note that historically, criteria pollutant reductions have been relevant to section 209(b)(1)(B). As previously noted, nothing in section 209(b) can be read as calling for EPA to waive preemption only if California seeks to enforce criteria pollutant standards. The Administrator is required to waive the preemption in section 209(a) unless California "does not need *such State standards to meet compelling and extraordinary conditions.*"<sup>293</sup> As also previously noted this is in stark contrast to, for example, section 211(c)(4)(C), which calls for a waiver of preemption only if a state demonstrates that a fuel program will result in criteria pollutant reductions that will enable achievement of applicable NAAQS.

The first section below focuses on criteria pollution reduction, which has long been relevant to section 209(b)(1)(B). EPA has never put in doubt that California's serious criteria air pollution problems (such as NAAQS nonattainment and the factors that give rise to those conditions, including the geographic and climate conditions in the State, the number of motor vehicles in California, and local and regional air quality) are "compelling and extraordinary," or that California "needs" regulations that address such emissions in order to achieve every fraction of criteria pollutant emissions it can achieve.<sup>294</sup> The factual record before the Agency in 2013 and again in 2019 includes ample documentation of criteria emission reductions from California's GHG standards and ZEV

is commonly called, air quality improvement efforts in many of California's air basins will need to be strengthened as temperatures increase in order to reach existing air quality goals."

<sup>293</sup> CAA section 209(b)(1)(B) (emphasis added).

<sup>294</sup> In SAFE 1, EPA found that California's criteria pollution conditions remain "compelling and extraordinary and that California needs standards to produce any and all reductions in criteria pollutant emissions." 84 FR at 51344, 51346.

sales mandate.<sup>295</sup> Nothing in the record is sufficient to demonstrate that California does not need the ACC program (or the motor vehicle emission program) or, in the context of the SAFE 1 interpretation, the specific GHG emission standards and the ZEV sales mandate to meet compelling needs related to criteria pollution. These benefits have a clear connection to California's "need" for its specific GHG standards and ZEV sales mandate, at issue under the waiver. The second section below focuses on the GHG reduction benefits of California's GHG standards and ZEV sales mandate. EPA acknowledges that California is particularly impacted by climate change, including increasing risks from record-setting fires, heat waves, storm surges, sea-level rise, water supply shortages and extreme heat, and that climate-change impacts in California are therefore "compelling and extraordinary conditions" for which California needs the GHG standards and ZEV sales mandate.

#### a. GHG Standards and ZEV Sales Mandates Have Criteria Emission Benefits

As shown below, criteria pollutant reductions are demonstrably connected to California's "need" for its GHG standards and ZEV sales mandate at issue under the waiver.<sup>296</sup> EPA first concluded that there is a "logical link between the local air pollution problem

<sup>295</sup> When California originally adopted a ZEV sales mandate into its regulations, a significant factor in support of its action was addressing criteria pollutant emissions. In SAFE 1 EPA acknowledged that California's ZEV mandate initially targeted only criteria pollution. 84 FR at 51329. EPA's 2013 waiver grant recognized that with California's ACC program California had shifted to relying on the ZEV requirements to reduce both criteria and GHG pollution. 78 FR at 2114.

<sup>296</sup> In response to comments arguing that upstream emission benefits should not be considered in determining the criteria pollutant benefits of CARB's standards or that it is inappropriate to elevate stationary source criteria pollutant emissions into a make-or-break factor in waivers for motor vehicle emission programs, EPA believes it appropriate to reiterate the air quality problems facing California, as evidenced by NAAQS attainment challenges. Waiver practice and applicable case law, as previously noted, afford California wide deference in its policy and regulatory approaches in addressing these challenges. Therefore, EPA believes that to the degree a nexus between CARB's standards and addressing its serious air quality problems is required, that it is reasonable to base the need on related criteria emission impacts. EPA notes that, in setting its federal light-duty vehicle GHG standards, it is afforded discretion under the CAA to consider upstream emission impacts and does include such consideration in its own rulemakings. 77 FR 62624, 62819 (October 15, 2012) (taking fuel related upstream GHG emissions into account in setting compliance values for vehicle GHG emissions standards).

of ozone and GHGs” in the 2009 California GHG waiver by explaining, for instance, that “the impacts of global climate change can nevertheless exacerbate this local air pollution problem.”<sup>297</sup> Moreover, as previously explained, in two additional GHG waiver requests and associated EPA waiver decisions since the 2009 GHG waiver, EPA acknowledged that CARB had demonstrated the need for GHG standards to address criteria pollutant concentrations in California. In the 2014 HD GHG waiver request, CARB projected, for example, “reductions in NO<sub>x</sub> emissions of 3.1 tons per day in 2014 and one ton per day in 2020” in California.<sup>298</sup>

In SAFE 1, EPA distinguished prior GHG waivers from the ACC program GHG waiver solely on grounds of how CARB attributed the pollution benefits in its waiver request. EPA explained that CARB had linked those prior waived GHG standards to criteria pollutant benefits but had not done so in the ACC program waiver request: “California’s *approach* in its ACC program waiver request differed from the state’s approach in its waiver request for MY 2011 and subsequent heavy-duty tractor-trailer GHG standards, where California quantified NO<sub>x</sub> emissions reductions attributed to GHG standards and explained that they would contribute to PM and ozone NAAQS attainment.”<sup>299</sup> Moreover, how CARB attributes the pollution reductions for accounting purposes from its various standards does not reflect the reality of how the standards deliver

<sup>297</sup> 74 FR at 32763. According to California, “California’s high ozone levels—clearly a condition Congress considered—will be exacerbated by higher temperatures from global warming . . . [T]here is general consensus that temperature increases from climate change will exacerbate the historic climate, topography, and population factors conducive to smog formation in California, which were the driving forces behind Congress’s inclusion of the waiver provision in the Clean Air Act.” *Id.* (quoting comments submitted by CARB during the 2009 reconsideration). CARB also explained that “the factors that cause ozone are primarily local in nature and [ ] ozone is a local or regional air pollution problem, the impacts of global climate change can nevertheless exacerbate this local air pollution problem. Whether or not local conditions are the primary cause of elevated concentrations of greenhouse gases and climate change, California has made a case that its greenhouse gas standards are linked to amelioration of California’s smog problems . . . . There is a logical link between the local air pollution problem of ozone and California’s desire to reduce GHGs as one way to address the adverse impact that climate change may have on local ozone conditions.” *Id.*

<sup>298</sup> 79 FR at 46261. See also 81 FR at 95985–86 n.27 (referencing Resolution 13–50’s statements supporting California’s continued need for its own motor vehicle program in order to meet serious ongoing pollution problems).

<sup>299</sup> 84 FR at 51337 n.252 (citing 79 FR at 46256, 46257 n.15, 46261, 46262 n.75).

emissions reductions and should not drive whether or not a waiver can be withdrawn. EPA believes, based on its historical deference to CARB in waiver proceedings, that CARB is entitled to this discretion.

EPA also believes that prior waiver decisions indicate that the “approach” taken by California in its waiver requests needs to be carefully assessed and understood by the Agency before discounting the benefits of its mobile source emission standards. The characterization of CARB’s “approach,” as not calling out criteria emissions benefits (such as upstream criteria emission benefits) of GHG standards, was incorrect and should not have undermined EPA’s findings and grant of the initial ACC program waiver request for the following reasons: (1) As previously noted, the ACC program standards are interrelated and all serve to reduce both criteria and GHG pollution; (2) CARB conducted a combined emissions analysis of the elements of the ACC program because the program was designed to work as an integrated whole; and (3) EPA has always considered California’s standards as a whole or “in the aggregate” under the traditional interpretation of section 209(b)(1)(B).<sup>300</sup> EPA noted the associated criteria pollutant and GHG emissions benefits for the whole ACC program: “the ACC program will result in reductions of both criteria pollutants and GHG emissions that, in the aggregate, are more protective than the pre-existing federal standards.”<sup>301</sup> EPA also made the requisite finding that California’s protectiveness finding for the ACC program was not arbitrary and capricious, under section 209(b)(1)(A), by explaining that “California’s ZEV and GHG emission standards are an addition to its LEV program.”<sup>302</sup>

In SAFE 1, EPA further asserted that “California’s responses to the SAFE proposal do not rebut the Agency’s views that the ZEV standards for MY 2021–2025 are inextricably interconnected with the design and purpose of California’s overall GHG reduction strategy.”<sup>303</sup> For the following reasons, however, EPA was also incorrect in the assessment of criteria emission benefits of CARB’s ZEV sales mandate. EPA focused on only the following snippet from one salient paragraph in CARB’s 2012

<sup>300</sup> ZEV ISOR, EPA–HQ–OAR–2012–0562–0008 at 72; CARB Supplemental Comments, EPA–HQ–OAR–2012–0562–0373 at 3.

<sup>302</sup> *Id.* at 2125.

<sup>303</sup> 84 FR at 51337.

waiver request as support for the lack of criteria emissions benefits: “There is no criteria emissions benefit from including the ZEV proposal in terms of vehicle (tank-to-wheel or TTW) emissions. The LEV III criteria pollutant fleet standard is responsible for those emission reductions in the fleet; the fleet would become cleaner regardless of the ZEV regulation because manufacturers would adjust their compliance response to the standard by making less polluting conventional vehicles.”<sup>304</sup> But, as discussed above, that was merely an attribution of benefits and did not reflect the practical reality of how California’s standards work. Moreover, the paragraph in its entirety goes on to explain that CARB’s ZEV sales mandate would achieve criteria emission reductions: “However, since upstream criteria and PM emissions are not captured in the LEV III criteria pollutant standard, net upstream emissions are reduced through the increased use of electricity and concomitant reductions in fuel production.”<sup>305</sup>

It bears note that this attribution of criteria pollutant reductions was similar to the one that CARB made almost a decade ago for the 2009 GHG waiver request.<sup>306</sup> For example, CARB provided “extensive evidence of its current and serious air quality problems and the increasingly stringent health-based air quality standards and federally required state planning efforts to meet those standards firmly.”<sup>307</sup> The States and Cities also commented that “the attribution CARB made as part of its waiver request was never intended to, and did not, establish the absence of any

<sup>304</sup> *Id.* at 51337, 51330, 51337, 51353–54, 51356, 51358.

<sup>305</sup> 2012 Waiver Request at 15–16. CARB also noted that criteria and PM emission benefits will vary by region throughout the State depending on the location of emission sources. Refinery emission reductions will occur primarily in the east Bay Area and South Coast region where existing refinery facilities operate. As refinery operations reduce production and emissions, the input and output activities, such as truck and ship deliveries, will also decline. This includes crude oil imported through the Los Angeles and Oakland ports, as well as pipeline and local gasoline truck distribution statewide. EPA again notes that in its light-duty vehicle GHG rulemaking in 2012 it also noted the upstream emission impacts. 77 FR at 62819.

<sup>306</sup> “The establishment of greenhouse gas emission standards will result in a reduction in upstream emissions (emission due to the production and transportation of the fuel used by the vehicle) of greenhouse gas, criteria and toxic pollutants due to reduced fuel usage.” EPA–HQ–OAR–2006–0173–0010.107 at 8.

<sup>307</sup> CARB, EPA–HQ–OAR–2012–0562–0371. CARB estimated benefits of the ZEV and GHG standards for calendar years by which the South Coast air basin must meeting increasingly stringent NAAQS for ozone: 2023, 2031, and 2037. States and Cities app. A at 2–4, app. C at 8–9.

vehicular emission benefits from the ZEV standard.” EPA believes that CARB’s statement was merely a “simplification that distinguished the standards based on the *primary* objectives of the two, complementary standards.”<sup>308</sup> EPA agrees that the record from 2013, and 2019, demonstrates that CARB’s attribution of short-term emissions benefits did not undercut the long-term vehicular emission benefits of the ZEV standards. Thus, regardless of how the emissions reductions are attributed, the GHG standards and ZEV sales mandate drive reductions in criteria pollution.

EPA has also consistently explained that “consideration of all the evidence submitted concerning a waiver decision is circumscribed by its relevance to those questions . . . consider[ed] under section 209(b).”<sup>309</sup> And so, as earlier noted, any reconsideration of a prior waiver decision must comport with criteria in section 209(b)(1) as well as have record support. Moreover, in prior waiver requests for ZEV sales mandate requirements, CARB has discussed criteria pollutant emissions reductions because of the mandate for sale of vehicles that have zero emissions.<sup>310</sup> CARB’s 2012 waiver request also indicated the clear intent regarding the evolution of the ZEV program and California’s decision to focus both on criteria pollutant and GHG reductions.<sup>311</sup> EPA’s reading of and reliance on the snippet from CARB’s waiver request describing the ZEV sales mandate requirements in the ACC program was both incorrect and improper, as well as contrary to congressional intent and EPA’s historic practice of affording broad discretion to California in selecting the best means for addressing the health and welfare of its citizens.

#### b. California Needs Its Standards To Address the Impacts of Climate Change in California

Under section 209(b)(1)(B), EPA is to grant a waiver request unless California

does not need the standards at issue to address “compelling and extraordinary conditions.” In applying the traditional approach, EPA has consistently reasoned that “compelling and extraordinary conditions” refers primarily to the factors that tend to produce higher levels of pollution in California—geographical and climatic conditions (like thermal inversions) that, when combined with large numbers and high concentrations of automobiles, create serious air pollution problems.<sup>312</sup> These conditions continue to exist in California and CARB, since the initial 2009 GHG waiver, has consistently drawn attention to the existential crisis that California faces from climate change and maintained that air quality issues associated with GHG emissions have exacerbated this crisis and have yet to attenuate.<sup>313</sup>

EPA now recognizes that CARB, as part of its original waiver request and in comments in response to SAFE 1, submitted ample evidence of multiple ways California is particularly impacted by climate change, including increasing risks from record-setting fires, heat waves, storm surges, sea-level rise, water supply shortages and extreme heat; in other words that GHG emissions contribute to local air pollution, and that climate-change impacts in California are “compelling and extraordinary conditions.” For example, CARB noted that “[r]ecord-setting fires, deadly heat waves, destructive storm surges, loss of winter snowpack—California has experienced all of these in the past decade and will experience more in the coming decades. California’s climate—much of what makes the State so unique and prosperous—is already changing, and those changes will only accelerate and intensify in the future. Extreme weather will be increasingly common as a result of climate change. In California, extreme events such as floods, heat waves, droughts and severe storms will increase in frequency and intensity. Many of these extreme events have the potential to dramatically affect human health and well-being, critical infrastructure and natural systems.”<sup>314</sup>

<sup>312</sup> 49 FR at 18890 (citing legislative history).

<sup>313</sup> 2012 Waiver Request at 1.

<sup>314</sup> CARB supplemental comment at EPA–HQ–OAR–2012–0562–0371. CARB notes that EPA’s reasoning that the “compelling and extraordinary conditions” criteria should be viewed as a “program as a whole” was upheld as “eminently reasonable” in *ATA v. EPA*, 600 F.3d 624, 627–29 (D.C. Cir. 2010), and that the ACC program appropriately integrates the passenger vehicle program to address multiple pollutant types, which also reflects the intent of Congress in 1977 to broaden California’s discretion to adjust its program as needed (*Ford Motor Co. v. EPA*, 606 F.2d at

Within the ACC waiver request, CARB provided a summary report on the third assessment from the California Climate Change Center (2012), which described dramatic sea level rises and increases in temperatures in California and associated impacts on local air quality and other conditions in California.<sup>315</sup>

To the extent that SAFE 1 relied on the premise that GHG emissions from motor vehicles located in California become globally-mixed as part of global climate change, and therefore do not pose a local air quality issue (placing aside the impacts of heat on ozone as

1294). This comment extensively lays out the compelling and extraordinary conditions associated with California’s air quality challenges and the need to reduce criteria emissions and greenhouse gas emissions associated with CARB’s ZEV sale mandate and GHG standards. *Id.* at 5 (“The critical nature of the LEV III regulation is also highlighted in the recent effort to take a coordinated look at strategies to meet California’s multiple air quality and climate goals well into the future. This coordinated planning effort, Vision for Clean Air: A Framework for Air Quality and Climate Planning (Vision for Clean Air) demonstrates the magnitude of the technology and energy transformation needed from the transportation sector and associated energy production to meet federal standards and the goals set forth by California’s climate change requirements.”).

<sup>315</sup> 78 FR at 2129 (“To the extent that it is appropriate to examine the need for CARB’s GHG standards to meet compelling and extraordinary conditions, as EPA discussed at length in its 2009 GHG waiver decision, California does have compelling and extraordinary conditions directly related to regulations of GHG. EPA’s prior GHG waiver contained extensive discussion regarding the impacts of climate change in California. In addition, CARB has submitted additional evidence in comment on the ACC waiver request that evidences sufficiently different circumstances in California. CARB notes that ‘Record-setting fires, deadly heat waves, destructive storm surges, loss of winter snowpack—California has experienced all of these in the past decade and will experience more in the coming decades. California’s climate—much of what makes the state so unique and prosperous—is already changing, and those changes will only accelerate and intensify in the future. Extreme weather will be increasingly common as a result of climate change. In California, extreme events such as floods, heat waves, droughts and severe storms will increase in frequency and intensity. Many of these extreme events have the potential to dramatically affect human health and well-being, critical infrastructure and natural systems.’”) (“Our Changing Climate 2012 Vulnerability & Adaptation to the Increasing Risks from Climate Change in California. Publication # CEC–500–2012– 007. Posted: July 31, 2012; available at <http://www.climatechange.ca.gov/adaptation/third-assessment/>”). EPA also noted that “the better interpretation of the text and legislative history of this provision is that Congress did not intend this criterion to limit California’s discretion to a certain category of air pollution problems, to the exclusion of others. In this context it is important to note that air pollution problems, including local or regional air pollution problems, do not occur in isolation. Ozone and PM air pollution, traditionally seen as local or regional air pollution problems, occur in a context that to some extent can involve long range transport of this air pollution or its precursors. This long-range or global aspect of ozone and PM can have an impact on local or regional levels, as part of the background in which the local or regional air pollution problem occurs.” 78 FR at 2128.

<sup>308</sup> States and Cities at 31 (original emphasis).

<sup>309</sup> 74 FR at 32748. See also 78 FR at 2115.

<sup>310</sup> 71 FR 78190 (December 28, 2006); 75 FR 11878 (March 12, 2010) and 76 FR 61095 (October 3, 2011).

<sup>311</sup> See 2012 Waiver Request at 2. At the December 2009 hearing, the Board adopted Resolution 09–66, reaffirming its commitment to meeting California’s long term air quality and climate change reduction goals through commercialization of ZEV technologies. The Board further directed staff to consider shifting the focus of the ZEV regulation to both GHG and criteria pollutant emission reductions, commercializing ZEVs and PHEVs in order to meet the 2050 goals, and to take into consideration the new LEV fleet standards and propose revisions to the ZEV regulation accordingly.

well as air quality impacts from the dramatic increase in wildfires), EPA notes that in addition to the record from the ACC waiver proceeding noted above, the SAFE 1 record contains sufficient and unrefuted evidence that there can be locally elevated carbon dioxide concentrations resulting from nearby carbon dioxide emissions.<sup>316</sup> This can have local impacts on, for instance, the extent of ocean acidification.<sup>317</sup> Thus, like criteria pollution, emissions of GHGs can lead to locally elevated concentrations with local impacts, in addition to the longer-term global impacts resulting from global increases in GHG concentrations.

Finally, in demonstrating the need for GHG standards at issue, CARB attributed GHG emissions reductions to vehicles in California. For instance, “CARB project[ed] that the standards will reduce car CO<sub>2</sub> emissions by approximately 4.9%/year, reduce truck CO<sub>2</sub> emissions by approximately 4.1%/year (the truck CO<sub>2</sub> standard target curves move downward at

<sup>316</sup> CARB comment at EPA–HQ–OAR–2018–0283–5054 at 305–06 (California’s Fourth Climate Assessment; [https://www.energy.ca.gov/sites/default/files/2019-12/Governance\\_External\\_Ekstrom\\_ada.pdf](https://www.energy.ca.gov/sites/default/files/2019-12/Governance_External_Ekstrom_ada.pdf)).

<sup>317</sup> See, for example, reports from California’s Fourth Climate Change Assessment, “California Mussels as Bio-indicators of Ocean Acidification,” available at [https://www.energy.ca.gov/sites/default/files/2019-12/Oceans\\_CCCA4-CNRA-2018-003\\_ada.pdf](https://www.energy.ca.gov/sites/default/files/2019-12/Oceans_CCCA4-CNRA-2018-003_ada.pdf) (“Because of the coupling between natural (upwelling-driven) and anthropogenic (CO<sub>2</sub> emission-driven) processes, California waters are already experiencing declines in pH that are not expected in other areas of the world’s oceans for decades (Feely et al. 2008; Chan et al. 2017). These perturbations to seawater chemistry join others associated with changing seawater temperatures (García-Reyes and Largier 2010) and reductions in ocean oxygenation (Bograd et al. 2008; Chan et al. 2008). Therefore, marine communities along the coast of California are increasingly subjected to a suite of concurrent environmental stressors. Substantial impetus exists to understand, quantify, and project biological and ecological consequences of these stressors, which current work suggests may be pervasive and diverse (Kroeker et al. 2010, 2013; Gaylord et al. 2015).”). Further, evidence in the record from a 2019 study demonstrated that locally enhanced carbon dioxide concentrations above Monterey Bay, California, fluctuate by time of day likely because of the magnitude of nearby urban carbon dioxide pollution and the effects of topography on offshore winds, and that this fluctuation increases the expected rate of acidification of the Bay. See Northcott, et al., *Impacts of urban carbon dioxide emissions on sea-air flux and ocean acidification in nearshore waters*, PLoS ONE (2019). For decades, the monthly average carbon dioxide concentrations off California’s coast have been consistently higher and more variable than those at Mauna Loa (which are commonly used as the global measurements). In fact, another more recent study shows that the waters of the California Current Ecosystem, off the coast of Southern California, have already acidified more than twice as much as the global average. E.g., Cal. Office of Environmental Health Hazard Assessment, *Atmospheric Greenhouse Gas Concentrations* (Feb. 11, 2019).

approximately 3.5%/year through the 2016–2021 period and about 5%/year from 2021–2025), and reduce combined light-duty CO<sub>2</sub> emissions by approximately 4.5%/year from 2016 through 2025.”<sup>318</sup> CARB also projected that its GHG emissions standards for MYs 2017–2025 will reduce fleet average CO<sub>2</sub> levels by about 34 percent from MY 2016 levels of 251 g/mile down to about 166 g/mile, based on the projected mix of vehicles sold in California.”<sup>319</sup> CARB further noted that there might be a GHG emission deficit if only the Federal GHG standards were implemented in California.<sup>320</sup> The GHG emissions from California cars, therefore, are particularly relevant to both California’s air pollution problems and GHG standards at issue.

In SAFE 1, EPA dismissed California’s “need” for the GHG standards at issue because their impact on GHG emissions would be too small to “meaningfully address global air pollution problems of the sort associated with GHG emissions”: “[T]he most stringent regulatory alternative considered in the 2012 final rule and [Final Regulatory Impact Analysis] . . . , which would have required a seven percent average annual fleetwide increase in fuel economy for MYs 2017–2025 compared to MY 2016 standards, was forecast to decrease global temperatures by only 0.02 °C in 2100.”<sup>321</sup> EPA also received similar comments in response to the Notice of Reconsideration. But since the inception of the waiver program, EPA has never applied a test to determine whether a California waiver request under 209(b)(1) would independently solve a pollution problem. EPA has never applied a *de minimis* exemption authority to California waiver request under section 209(b)(1).<sup>322</sup> EPA believes there is no basis for exercise of such a test under section 209(b), considering that CARB continues to maintain that emissions reductions in California are essential for meeting the NAAQS.<sup>323</sup> EPA has reiterated that “California’s policy judgment that an incremental, directional improvement will occur and is worth pursuing is entitled, in EPA’s

<sup>318</sup> 78 FR at 2139.

<sup>319</sup> *Id.* at 2135.

<sup>320</sup> *Id.* at 2122.

<sup>321</sup> 84 FR at 51349.

<sup>322</sup> See, e.g., 74 FR at 32766 (“As noted by the Supreme Court in *Massachusetts v. EPA*, while it is true that regulating motor vehicle GHG emissions will not by itself reverse global warming, a reduction in domestic automobile emissions would slow the pace of global emissions increase no matter what happens with regard to other emissions.”).

<sup>323</sup> See *Alabama Power Co. v. Costle*, 636 F.2d 323, 360–66, n.89 (D.C. Cir. 1979).

judgment, to great deference.”<sup>324</sup> As the Supreme Court has recognized, “[a]gencies, like legislatures, do not generally resolve massive problems in one fell regulatory swoop. . . . They instead whittle away at them over time, refining their preferred approach as circumstances change and as they develop a more nuanced understanding of how best to proceed.”<sup>325</sup> And so, in the ACC program waiver decision, EPA also explained that “[t]he issue of whether a proposed California requirement is likely to result in only marginal improvement in air quality not commensurate with its cost or is otherwise an arguably unwise exercise of regulatory power is not legally pertinent to my decision under section 209.”<sup>326</sup>

Further, nothing in either section 209 or the legislative history could be read as requiring EPA to grant GHG standards waiver requests only if California’s GHG pollution problem is the worst in the country.<sup>327</sup> CARB further demonstrated a “need” for its GHG standards by projecting GHG emissions reductions deficits from implementation of only the Federal GHG program in California. “[I]f a National Program standard was theoretically applied only to California new vehicle sales alone, it might create a GHG deficit of roughly two million tons compared to the California standards.”<sup>328</sup>

### 3. California’s ZEV Sales Mandate as Motor Vehicle Control Technology Development

Congress also envisioned that California’s other role under section 209(b) would be an innovative laboratory for motor vehicle emission

<sup>324</sup> 74 FR at 32766 (“Under this approach, there is no need to delve into the extent to which the GHG standards at issue here would address climate change or ozone problems. That is an issue appropriately left to California’s judgment. . . . Given the comments submitted, however, EPA has also considered an alternative interpretation, which would evaluate whether the program or standards has a rational relationship to contributing to amelioration of the air pollution problems in California. Even under this approach, EPA’s inquiry would end there. California’s policy judgment that an incremental, directional improvement will occur and is worth pursuing is entitled, in EPA’s judgment, to great deference.”).

<sup>325</sup> *Massachusetts v. EPA*, 549 U.S. 497, 524 (2007).

<sup>326</sup> 78 FR at 2134.

<sup>327</sup> 49 FR at 18891.

<sup>328</sup> 78 FR at 2122 (citing EPA–HQ–OAR–2012–0562–0374 at 3). CARB also noted that “to the extent a manufacturer chooses not to exercise their National Program compliance option in California this would actually provide additional GHG benefits in California, so compliance in California can never yield fewer cumulative greenhouse gas reductions from the industry wide fleet certified in California.” *Id.* at 2122 n.61.

standards and control technology. California is to serve as “a kind of laboratory for innovation”<sup>329</sup> and to “blaze its own trail with a minimum of federal oversight.”<sup>330</sup> California’s “unique [air pollution] problems and [its] pioneering efforts justifi[ed] a waiver of the preemption section.”<sup>331</sup> Congress stressed that California should serve the Nation as a “testing area” for more protective standards.<sup>332</sup> In the 2009 GHG waiver, for example, EPA explained that “the basic nature of the compromise established by Congress [is that] California could act as the laboratory for the nation with respect to motor vehicle emission control, and manufacturers would continue to face just two sets of emissions standards—California’s and EPA’s.”<sup>333</sup> California’s ZEV sales mandates have so far supported development of technologies such as battery electric and fuel cell vehicles that embody the pioneering efforts Congress envisaged. EPA acknowledged this important role in the ACC program waiver by explaining that California needs the ZEV sales mandate requirement to ensure the development and commercialization of technology required for the future, deeper vehicular emission reductions California will have to attain to meet its NAAQS obligations as well as achieve other long-term emission goals of new vehicle sales between 2040 and 2050.<sup>334</sup> In SAFE 1, however, EPA did not consider this additional role carved out in section 209(b)(1) for California as a proven ground for motor vehicle control emissions technology.<sup>335</sup>

In sum, while nothing in section 209 or the legislative history limits EPA’s waiver authority to standards that reduce criteria pollution,<sup>336</sup> analyses in this section again recognize the way the different requirements in the ACC program work together to reduce criteria

and GHG pollution and spur technological innovation. These analyses conclude that GHG pollution exacerbates tropospheric ozone pollution, worsening California’s air quality problems, and the manner in which GHG and criteria pollutant standards work together to reduce both forms of pollution. Ample record support exists on California’s need for both GHG standards and ZEV sales mandate at issue to address compelling and extraordinary conditions in California. As noted above, in SAFE 1 EPA, however, relied on an excerpt of the ACC program waiver record to determine the lack of criteria emission benefits of GHG emission standards and ZEV sales mandate at issue. In doing so, EPA did not evaluate the complete record from the ACC waiver proceeding and the nature of California’s air quality problem, including the relationship of climate change to California’s ability to achieve the ozone NAAQS in the assessment of California’s need for these requirements.<sup>337</sup>

As noted above, in SAFE 1, EPA established a new test under section 209, requiring a particularized, local nexus between (1) pollutant emissions from sources, (2) air pollution, and (3) resulting impact on health and welfare, a test that would exclude GHG pollution from the scope of the waiver.<sup>338</sup> But this test is found nowhere in the text of section 209—the statute does not contain this requirement, or even use these terms.

EPA’s review of the complete record confirms the Agency’s conclusions in the ACC program waiver that California needs the GHG standards at issue to meet a compelling and extraordinary conditions regardless of whether the Agency focuses on criteria or greenhouse gas pollution reduction.

This review also indicates that opponents of the waiver (including EPA in SAFE 1) did not meet the burden of proof necessary to demonstrate that California did not have a need for the GHG standards, including under the nexus test applied in SAFE 1. It also bears note that EPA’s longstanding practice, based on the statutory text, legislative history, and precedent calls for deference to California in its approach to addressing the interconnected nature of air pollution within the state and is not limited to criteria pollutant problems. Critically, EPA is not to engage in “probing substantive review” of waiver requests,<sup>339</sup> but rather “afford California the broadest possible discretion in selecting the best means to protect the health of its citizens and the public welfare.”<sup>340</sup>

### E. Conclusion

Considering the text, legislative history, and precedent that support the Agency’s historical practice of interpreting section 209(b)(1)(B) as calling for a program-level evaluation of waiver requests, as well as the uncertainty in settled expectations created by the SAFE 1 interpretation, EPA rescinds its actions in SAFE 1 regarding both the interpretation of section 209(b)(1)(B) and the findings regarding California’s need for the GHG standards and ZEV sales mandate. EPA believes that the burden of proof had not been met in SAFE 1, based on the complete factual record, to demonstrate that California did not have a need for the GHG standards and ZEV sales mandate under the SAFE 1 interpretation of the second waiver prong nor had the burden been met to support a finding that the ample evidence in the record at the time of the ACC waiver decision did not demonstrate that California had a need for its standards to meet compelling and extraordinary conditions. As noted above, the result of the rescission of the SAFE 1 action is the reinstatement of the ACC program waiver. EPA confirms the traditional interpretation of section 209(b)(1)(B) was appropriate and continues to be, at least, a better interpretation regardless of the rescission of the SAFE 1 interpretation of this criterion.<sup>341</sup>

<sup>335</sup> 84 FR at 51343 (“[I]n a statute designed to address public health and welfare, it certainly cannot mean standards that allow a state to be “a laboratory for innovation” in the abstract, without any connection to a need to address pollution problems.”).

<sup>336</sup> The Agency again notes that, unlike provisions of the CAA such as section 211(c)(4)(C) which allows EPA to waive preemption of a state fuel program respecting a fuel characteristic or component that EPA regulates through a demonstration that the state fuel program is necessary to achieve a NAAQS, section 209(b) makes no mention of NAAQS pollutants or otherwise indicates that air pollutants should be treated differently.

<sup>337</sup> For example, CARB’s ISOR for its ZEV standards identifies at Table 6.2 the well to wheel emission benefits of the ZEV program compared to the LEV III program. ZEV ISOR, EPA–HQ–OAR–2012–0562–0008 at 78. See also 2012 Waiver Request at 16. CARB noted in its comments on the SAFE proposal that “Rising temperatures exacerbate California’s ozone problem by increasing ground-level ozone concentrations.” CARB, EPA–HQ–OAR–2018–0283–5054 at 371–72 (citing the 2012 Waiver Request). ## VI. EPA Inappropriately Considered Preemption Under the Energy Policy and Conservation Act (EPCA) in Its Waiver Decision

SAFE 1's other justification for withdrawing the ACC program waiver was that California's GHG standards and ZEV sales mandate were preempted under EPCA. As explained in detail in Section IV, EPA believes this basis for reconsideration was outside the appropriate bounds of EPA's authority to reconsider previously granted waivers. In particular, if EPA could reconsider and withdraw a waiver based on a factor not contained in the specified criteria for denial in section 209(b)(1), EPA could circumvent the specified criteria for denial via reconsideration of previously granted waiver.

Even if it were appropriate for EPA to reconsider a previously granted waiver based on non-statutory factors, in this action, EPA concludes that it was inappropriate to rely on preemption under EPCA as a basis for withdrawing certain aspects of the ACC program waiver. In SAFE 1, a joint action between NHTSA and EPA, NHTSA concluded that state or local regulations of tailpipe carbon dioxide emissions are "related to fuel economy standards" and are therefore preempted under EPCA.<sup>342</sup> As a direct result of NHTSA's codified text and pronouncements on preemption set forth in SAFE 1, EPA withdrew the ACC program waiver for California's GHG standards and ZEV sales mandate on grounds that they were preempted under EPCA. In SAFE 1, EPA believed it was appropriate to consider the effect of NHTSA's actions, including the view that California cannot enforce standards that are void *ab initio*, and thus EPA stated that "to the extent that administrative action is necessary on EPA's part to reflect that state of affairs, EPA hereby withdraws that prior grant of a waiver on this basis."<sup>343</sup> NHTSA has since issued a

<sup>342</sup> 49 U.S.C. 32919(a) ("When an average fuel economy standard prescribed under this chapter is in effect, a State or a political subdivision of a State may not adopt or enforce a law or regulation related to fuel economy standards or average fuel economy standards for automobiles covered by an average fuel economy standard under this chapter."). NHTSA noted that a law or regulation having the direct or substantial effect of regulating or prohibiting tailpipe carbon dioxide emissions from automobiles or automobile fuel economy is a law or regulation related to fuel economy standards and expressly preempted under 49 U.S.C. 32919(a). 84 FR at 51317–18. NHTSA's rule was codified at 49 CFR 531.7 ("Preemption") and 533.7 ("Preemption"), as well as each Appendix B in 49 CFR part 531 ("APPENDIX B TO PART 531—PREEMPTION") and Part 533 ("APPENDIX B TO PART 533—PREEMPTION").

<sup>343</sup> 84 FR at 51338.

new final rule that formally repeals the codified text and pronouncements regarding preemption under EPCA found in SAFE 1. Upon reconsideration, EPA now believes that, given NHTSA's repeal of its regulation and pronouncements in SAFE 1, preemption under EPCA cannot serve as a basis for the withdrawal of the ACC program waiver as it did in SAFE 1—if it could ever legitimately serve as such basis. EPA thus believes it is appropriate to rescind the portion of the waiver withdrawal that was based on preemption under EPCA.

In addition, given the unique consideration of preemption under EPCA in SAFE 1 and its effect on an otherwise validly issued waiver under the CAA, EPA believes it is helpful to provide additional information regarding the Agency's historical practice and views to demonstrate why consideration of preemption under EPCA was inappropriate. Consideration of preemption under EPCA is beyond the statutorily prescribed criteria for EPA in section 209(b)(1). Preemption under EPCA was not a factor that California addressed under the applicable waiver criteria in its initial request nor was it a factor that EPA considered in granting the ACC program waiver. Until SAFE 1, the Agency consistently refrained from reviewing waiver requests against factors beyond the statutorily listed criteria under section 209(b)(1). Thus, EPA also believes that in the reconsideration of a waiver where EPA had previously declined to consider preemption under EPCA, SAFE 1 was contrary to congressional intent and the Agency's historic practice of hewing to section 209(b)(1) statutory criteria in reviewing waiver requests. Given this backdrop, EPA believes that the joint rulemaking context of SAFE 1 was an improper basis to deviate from EPA's long held belief to not consider factors outside the scope of section 209(b)(1), especially given that the Agency indicated it would only be a singular occurrence. EPA continues to view the text and congressional intent of the statute, as well as subsequent case law, as best supporting a limited scope of review for waiver requests under section 209(b)(1)—irrespective of whether a waiver proceeding is undertaken either solely by EPA or in unison with another agency. Therefore, based on EPA's historical practice of not considering factors outside of the section 209(b)(1) criteria and because EPA believes the "joint-action" premise was improper, the Agency is rescinding its withdrawal

of the ACC program waiver based on preemption under EPCA.

### A. Historical Practice and Legislative History

Historically, in reviewing California's waiver requests, EPA has refrained from the consideration of factors beyond those criteria set out in section 209(b)(1).<sup>344</sup> EPA has generally explained that the text, structure, and purpose of the California waiver provision indicate congressional intent for EPA to provide significant deference to California's judgment, especially on "ambiguous and controversial matters of public policy."<sup>345</sup> In section 209(a), Congress generally preempted state standards relating to the control of emissions from new motor vehicles and engines, but, in section 209(b), Congress carved out an exception for California, directing EPA to grant California a waiver of section 209(a) unless the Agency can make a finding under section 209(b). Congress recognized that California's "compelling and extraordinary circumstances," and its historical practice of regulating in the area, were sufficient "to justify standards on automobile emissions which may, from time to time, need be more stringent than national standards."<sup>346</sup> In creating the waiver program, Congress intended not only for California to be able to meet its own emission reduction needs, but also for California to act as "a kind of laboratory for innovation" for motor vehicle standards and control technology.<sup>347</sup>

<sup>344</sup> See, e.g., 43 FR at 32184 (rejecting objections to the procedures at state level, objections that section 207(c)(3)(A) establishes field protection, and constitutional objections all as beyond the "narrow" scope of the Administrator's review); 74 FR at 32783 (rejecting comments asking for the consideration of EPCA because it is not one of the three statutorily prescribed criteria); 78 FR at 2145 (again rejecting comments asking for the consideration of EPCA because it is outside the statutory criteria); 79 FR at 46265 (rejecting the argument that the HD GHG Regulations "impermissibly regulate fuel economy" because, like the commerce clause and Federal Aviation Administration Authorization Act of 1994 (FAAAA) issues, this issue is "outside the proper scope of review since it is not among the criteria listed under section 209(b).").

<sup>345</sup> 78 FR at 2112, 2115; 40 FR at 23103–04; 58 FR 4166.

<sup>346</sup> H.R. Rep. No. 90–728, 90th Cong., 1st Sess. 21 (1967); S. Rep. No. 403, 90th Cong., 1st Sess. 33 (1967) ("The waiver of preemption is for California's 'unique problems and pioneering efforts.'").

<sup>347</sup> *MEMA I*, 627 F.2d 1095, 1111 (D.C. Cir. 1979); 113 Cong. Rec. 30950, 32478 (Statement of Sen. Murphy) ("The United States as a whole will benefit by allowing California to continue setting its own more advanced standards for control of motor vehicle emissions. . . [The] State will act as a testing agent for various types of controls and the country as a whole will be the beneficiary of this research.").

Thus “Congress consciously chose to permit California to blaze its own trail with a minimum of federal oversight.”<sup>348</sup>

Legislative history makes clear that the Administrator must “presume” that the California standards “satisfy the waiver requirements” and that the burden of proving otherwise rests on the Administrator or other parties favoring denial of the waiver.<sup>349</sup> Further, according to the House Committee Report for the 1977 amendments that strengthened California’s waiver provisions, EPA is “to afford California the broadest possible discretion in selecting the best means to protect the health of its citizens and the public welfare.”<sup>350</sup> According to the House Report, “The Administrator, thus, is not to overturn California’s judgment lightly. Nor is he to substitute his judgment for that of the State. There must be “clear and compelling evidence that the State acted unreasonably in evaluating the relative risks of various pollutants in light of the air quality, topography, photochemistry, and climate in that State, before EPA may deny a waiver.”<sup>351</sup> EPA’s historic practice of considering only listed criteria is thus in keeping with the highly deferential review of waiver requests that Congress intended in carving out the exception from preemption of new motor vehicle and engine standards in section 209(a).<sup>352</sup>

Courts have generally agreed with the Agency’s consideration of only listed CAA criteria in reviewing waiver requests, also pointing to the statute’s lack of any indication of the ability to consider non-statutory criteria as well as the waiver program’s significant deference to California. The D.C. Circuit has stated that, under the text of the statute, the section 209(b) criteria are “the only waiver standards with which California must comply” and that, therefore, “[i]f EPA concludes that California’s standards [meet section 209(b)], it is obligated to approve California’s waiver application.”<sup>353</sup> The D.C. Circuit has repeatedly described EPA’s waiver approval role as “limited” and “narrow.” In *MEMA I*, for example, the court explained that “the Administrator has consistently held

since first vested with the waiver authority, [that] his inquiry under section 209 is modest in scope. He has no ‘broad and impressive’ authority to modify California regulations.”<sup>354</sup> The court further noted that “there is no such thing as a ‘general duty’ on an administrative agency to make decisions based on factors other than those Congress expressly or impliedly intended the agency to consider.”<sup>355</sup> Similarly, the court has stated that “[t]he statute does not provide for any probing substantive review of the California standards by federal officials” and that “EPA’s only role is to review California’s proposed rules under a narrowly defined set of statutory criteria.”<sup>356</sup> Thus, the court has consistently rejected arguments requiring EPA to consider factors outside of the statutory criteria. In *MEMA I*, the court rejected a constitutional objection to a waiver, explaining that, because “the Administrator operates in a narrowly circumscribed proceeding requiring no broad policy judgments on constitutionally sensitive matters,” “[n]othing in section 209 requires him to consider the constitutional ramifications of the regulations for which California requests a waiver . . . although nothing in section 209 categorically forbids” it.<sup>357</sup> In the same case, the court also rejected an antitrust objection as outside the scope of the Administrator’s review.<sup>358</sup> The court again upheld EPA’s decision to not consider constitutional objections in *American Trucking Association (ATA) v. EPA*, stating, “We agree with EPA that ATA is seeking ‘improperly to engraft a type of constitutional Commerce Clause analysis onto EPA’s [s]ection 7543(e) waiver decisions that is neither present in nor authorized by the statute.”<sup>359</sup>

It is against this backdrop that EPA has reviewed waiver requests by evaluating them solely under the criteria of section 209(b). For instance, prior to SAFE 1, EPA had solicited comment, in the context of the 2008 and 2009 GHG notices for comment on CARB’s first waiver request for GHG emission

standards, as to whether the EPCA fuel economy preemption provisions were relevant to EPA’s consideration of CARB’s authority to implement its motor vehicle GHG regulations.<sup>360</sup> In both instances, EPA declined to consider preemption under EPCA.<sup>361</sup> In the 2009 waiver, EPA explained that “section 209(b) of the Clean Air Act limits our authority to deny California’s requests for waivers to the three criteria therein.”<sup>362</sup> EPA further pointed to its historic practice of “refrain[ing] from denying California’s requests for waivers based on any other criteria,” which had been reviewed and upheld by the Court of Appeals for the District of Columbia Circuit.<sup>363</sup> In the 2013 review of the ACC program waiver request, the Agency again declined to consider factors outside the statutory criteria, explaining that “EPA may only deny waiver requests based on the criteria in section 209(b), and inconsistency with EPCA is not one of those criteria.”<sup>364</sup> A year later, EPA yet again declined to consider constitutionality claims, preemption under EPCA, and the implications of the Federal Aviation Administration Authorization Act of 1994 (FAAAA).<sup>365</sup> EPA explained that section 209(b) limits the Agency’s authority to deny California’s requests for waivers to the three criteria therein and that the Agency has consistently refrained from denying California’s requests for waivers based on any other criteria.<sup>366</sup>

In SAFE 1, EPA changed course, reasoning instead that the Agency pronouncement in the ACC program waiver decision on factors EPA could consider in denying a waiver request “was inappropriately broad, to the extent it suggested that EPA is categorically forbidden from ever determining that a waiver is inappropriate due to consideration of anything other than the ‘criteria’ or ‘prongs’ at section 209(b)(1)(B)(A)–

(C).<sup>367</sup> EPA explained that this statement and EPA's historical practice of not considering preemption under EPCA "were made in the context of EPA acting on its own to administer section 209(b) in considering such applications."<sup>368</sup> Further, EPA distinguished these previous single-agency actions from its SAFE 1 joint action context by explaining that ignoring NHTSA's determination of preemption in the same action, "would place the United States Government in the untenable position of arguing that one federal agency can resurrect a State provision that, as another federal agency has concluded and codified, Congress has expressly preempted and therefore rendered void *ab initio*."<sup>369</sup> At the same time, EPA expressed intentions not to consider factors outside the statutory criteria in future waiver proceedings.<sup>370</sup> EPA then concluded that NHTSA's determination of preemption in the same action "renders EPA's prior grant of a waiver for those aspects of California's regulations that EPCA preempts invalid, null, and void" because "California cannot enforce standards that are void *ab initio*."<sup>371</sup>

#### B. Notice of Reconsideration of SAFE 1 and Request for Comment

In its April 28, 2021, Notice of Reconsideration, EPA acknowledged that SAFE 1's consideration of NHTSA's finding of preemption under EPCA deviated from its historic practice of "declin[ing] to look beyond the waiver criteria in section 209(b) when deciding the merits of a waiver request from CARB."<sup>372</sup> EPA sought comment on whether "EPA properly considered and withdrew portions of the ACC program waiver pertaining to GHG standards and the ZEV sales mandate based on NHTSA's EPCA preemption action, including whether EPA had the authority to withdraw an existing waiver based on a new action beyond the scope of section 209."<sup>373</sup> Given EPA's reliance on NHTSA's preemption findings as a basis of waiver withdrawal in SAFE 1, EPA also sought comment on how the repeal of SAFE 1, should NHTSA take final action to do so, would

affect its own reconsideration of SAFE 1.

#### C. Comments Received

EPA received comments in support of and against the consideration of preemption under EPCA in reviewing requests for waivers by California. Multiple comments related to the Agency's use of the joint action with NHTSA as a justification for deviating from the Agency's practice of reviewing waiver requests under the specific statutory criteria. Some commenters agreed that the context of a joint action necessitated consideration of preemption under EPCA because NHTSA was the agency charged with interpreting and implementing EPCA and so EPA must consider its findings in the same action.<sup>374</sup> One commenter also argued that the joint rulemaking of SAFE 1 would be consistent with pronouncements in *Massachusetts v. EPA* (2007) on the agencies' respective statutory obligations and the need to avoid inconsistency and so, "[o]nce NHTSA proposed to finalize a determination that EPCA preempts California's GHG motor vehicle standards, it would be unreasonable for the EPA to refuse to take NHTSA's action into account."<sup>375</sup>

Other commenters argued that the context of the rulemaking, whether joint or not, was irrelevant. One commenter stated emphatically that "what Congress directed EPA to consider when it wrote Section 209(b)(1) does not change depending on whether EPA acts alone or with another agency."<sup>376</sup> Some commenters also argued that the context of the rulemaking was a particularly insufficient justification for revoking the waiver given language in SAFE 1 that allowed for inconsistent consideration of EPCA preemption. Several commenters noted that EPA constrained the future applicability of SAFE 1 by explaining that the Agency would not consider factors outside statutory criteria in future waiver reviews in other subject areas.<sup>377</sup> Another commenter also noted that "the action purported to be 'joint,' and yet as now acknowledged, SAFE Part 1 'is properly considered as two severable actions, a rulemaking by NHTSA and a final informal adjudication by EPA.'" <sup>378</sup> These inconsistencies, they argued, made SAFE 1's distinction between single-

agency and joint actions arbitrary and capricious.

Commenters also argued for and against consideration of factors outside the statutory criteria—including, but not limited to, preemption under EPCA—regardless of the kind of agency action, although EPA did not make this argument in SAFE 1. Commenters argued that EPA's authority to look outside the statutory criteria at EPCA was at least permissive, if not mandatory. According to one commenter, "EPA exaggerates the Court's position" in *MEMA I* in its Reconsideration notice: "[T]he court did not say that the EPA is *forbidden* to take constitutional ramifications into consideration, only that it is *not required* to do so."<sup>379</sup> Another commenter agreed that *MEMA I* and *MEMA II* "do not preclude EPA from considering" preemption under EPCA but then went further, saying that "EPA is *required* to consider EPCA preemption."<sup>380</sup> The commenter argued that *MEMA I* rejected petitioners' constitutional objections to a waiver under an institutional competence line of reasoning, concluding that "[t]he waiver proceeding produces a forum ill-suited to the resolution of constitutional claims."<sup>381</sup> In contrast, they continued, the waiver proceeding is an appropriate forum for determining whether emission standards "relate to" fuel economy because this issue is "within the agency's competence, as this relationship is mathematical and based in science rather than understandings of Constitutional law and precedent."<sup>382</sup> However, the other commenter, who agreed that EPA is not "forbidden" from considering preemption under EPCA, also noted that EPA "has no special competence to interpret EPCA."<sup>383</sup>

Several commenters also argued that EPA could not reinstate the waiver because NHTSA concluded that EPCA preempts the standards, such standards were void *ab initio*, and therefore "the state mandates referenced in CA's petition for reconsideration are not even eligible to be considered for a CAA waiver of preemption."<sup>384</sup> To ignore

<sup>378</sup> SCAQMD at 7 (quoting 86 FR at 22439, n.40).

this, they claimed, would violate the Supremacy Clause of the Constitution. EPA, therefore, must look outside the statutory criteria to consider preemption under EPCA because it cannot “reasonably claim that the lawfulness and constitutionality of state actions over which it has supervision are issues outside the scope of its responsibility[.]”<sup>385</sup>

In contrast, other commenters pointed to EPA’s historical practice of evaluating waiver requests under the section 209 statutory criteria, the text of the statute, and the policy implications of looking outside the statutory criteria, to support a return to EPA’s traditional narrow approach. Most commenters argued that EPA’s traditional interpretation was consistent with the text of section 209(b), which has no reference to preemption under EPCA or any other factors outside the three statutory criteria.<sup>386</sup> Not only does EPA have “no grounds to read EPCA preemption considerations into the statute,”<sup>387</sup> these commenters argued, but to consider non-statutory criteria would actually be “arbitrary and capricious”<sup>388</sup> and contrary to “precedent respecting separation of powers and federalism principles.”<sup>389</sup> Yet another commenter stated that the narrow interpretation “provides a safeguard from the capricious injection of outside-the-scope argumentation” because “[w]hen the adjudication is permitted to stray from the statutory criteria, prospects for a fair hearing can be derailed, and the EPA Administrator may be more prone to overstep and

CO<sub>2</sub> standards and ZEV mandates, because EPCA had already turned those policies into legal phantoms—mere proposals without legal force or effect.”)

<sup>385</sup> CEI at 11.

<sup>386</sup> See, e.g., States and Cities at 20 (“EPA’s traditional understanding of its limited role is entirely consistent with the text of Section 209(b)(1) and precedent interpreting it.”); NCAT at 12 (“As EPA has stated in several prior waiver decisions, there is no reference in Section 209(b) to EPCA preemption nor anything that could be construed to address this issue. Section 209(b) is unambiguous in this regard, and EPA has no grounds to read EPCA preemption considerations into the statute.”).

<sup>387</sup> NCAT at 12.

<sup>388</sup> NESCAUM at 7 (“As the D.C. Circuit has explained in the context of Section 209(b), ‘there is no such thing as a general duty’ on an administrative agency to make decisions based on factors other than those Congress expressly or impliedly intended the agency to consider.’ It is a basic principle of administrative law that an agency action is ‘arbitrary and capricious if the agency has relied on factors which Congress has not intended it to consider.’”).

<sup>389</sup> States and Cities at 20 (“It is likewise entirely consistent with precedent respecting separation of powers and federalism principles and holding that ‘a federal agency may pre-empt state law only when and if it is acting within the scope of its congressionally delegated authority.’ *Louisiana Pub. Serv. Comm’n v. FCC*, 476 U.S. 355, 374 (1986).”).

exert policy preferences that are impermissible.”<sup>390</sup>

Additionally, in their petitions for reconsideration of SAFE 1, several states and cities asserted that EPA unlawfully changed course in SAFE 1 by considering (and relying on) the purported preemptive effect of EPCA, which is outside the confines of section 209(b) and argued that this rationale for withdrawing the waiver was flawed.<sup>391</sup>

#### D. Analysis: EPA Is Rescinding Its SAFE 1 Actions Related to Preemption Under EPCA

Since SAFE 1, NHTSA has formally withdrawn its conclusions (and associated regulatory text) that state or local regulations of tailpipe carbon dioxide emissions are related to fuel economy standards and therefore preempted under EPCA.<sup>392</sup> Thus the predicate for EPA’s decision to withdraw the ACC waiver on that basis no longer exists. Furthermore, given the context of EPA’s reconsideration of the ACC program waiver at the time of SAFE 1, the Agency believes it was inappropriate to reconsider the validity of the waiver against criteria such as preemption under EPCA. In this action, based on the two independent grounds noted above, the Agency is rescinding the portion of SAFE 1 that withdrew the ACC program waiver based on preemption under EPCA.

##### 1. NHTSA Has Since Repealed Its Findings of Preemption Made in SAFE 1

In the Notice of Reconsideration, EPA sought comment on the Agency’s reliance on NHTSA’s preemption findings as a basis for its withdrawal of the ACC program waiver in SAFE 1. EPA also sought comment on how the repeal of SAFE 1, should NHTSA take final action to do so, would affect its own reconsideration of SAFE 1.<sup>393</sup> NHTSA has since withdrawn its findings of preemption and the preemption basis of withdrawal is no longer applicable. Specifically, NHTSA has issued a new final rule that formally repeals the codified text and additional pronouncements regarding preemption under EPCA found in SAFE 1.<sup>394</sup> In

<sup>390</sup> SCAQMD at 7.

<sup>391</sup> 86 FR at 22428.

<sup>392</sup> 86 FR 74236.

<sup>393</sup> 86 FR at 22429.

<sup>394</sup> 86 FR 74236. NHTSA notes in this rulemaking that “the Agency is repealing all regulatory text and appendices promulgated in the SAFE I Rule. In doing so, the Agency underscores that any positions announced in preambulatory statements of prior NHTSA rulemakings, including in the SAFE I Rule, which purported to define the scope of preemption under the Energy Policy and Conservation Act (EPCA), do not reflect the Agency’s reconsidered

SAFE 1, EPA stated that it was appropriate to consider the effect of NHTSA’s actions, including the view that California cannot enforce standards that are void *ab initio* and thus EPA stated that “to the extent that administrative action is necessary on EPA’s part to reflect that state of affairs, EPA hereby withdraws that prior grant of a waiver on this basis.”<sup>395</sup> Since this condition no longer exists, EPA believes it is appropriate to rescind the waiver withdrawal that was based on preemption under EPCA. EPA believes that, to the extent it was ever appropriate for the Agency to base its action on NHTSA’s finding of preemption under EPCA in SAFE 1, the repeal of the preemption rule makes it likewise appropriate to rescind the Agency’s action in SAFE 1. This would also act to minimize regulatory uncertainty as to do otherwise would create further confusion that resulted from the joint action in SAFE 1 and would not appropriately reflect the current state of affairs under the circumstances of a unique federal regulation that had otherwise motivated EPA’s actions in SAFE 1. NHTSA’s recent action also supports EPA’s belief that its practice of limiting its review of section 209(b) criteria, as explained below, remains appropriate in the context of preemption under EPCA.

##### 2. EPA Improperly Deviated From Its Historical Practice of Limiting Its Review to Section 209(b) Criteria

Section 209(b)(1) of the Act limits the Agency’s authority to deny California’s requests for waivers to the three criteria contained therein and the Agency has consistently refrained from reviewing California’s requests for waivers based on any other criteria. EPA acknowledges that California adopts its standards as a matter of law under its state police powers, that the Agency’s task in reviewing waiver requests is limited to evaluating California’s request according to the criteria in section 209(b), and that it is appropriate to defer to litigation brought by third parties in other courts, such as state or federal district court, for the resolution of any constitutionality claims and assertions of inconsistency with other statutes.

understanding of its proper role in matters of EPCA preemption.”

<sup>395</sup> EPA distinguished these previous single-agency actions from its joint action context by explaining that ignoring NHTSA’s determination of preemption in the same action, “would place the United States Government in the untenable position of arguing that one federal agency can resurrect a State provision that, as another federal agency has concluded and codified, Congress has expressly preempted and therefore rendered void *ab initio*.” 84 FR at 51338.

Considering the lack of statutory and precedential support as shown below, even if EPA were to have discretion to consider criteria outside section 209(b), EPA now views the joint-action context of SAFE 1 as an insufficient justification for deviating from its statutory authority and the Agency's historical practice and therefore the Agency rescinds its actions regarding preemption under EPCA in SAFE 1.

Withdrawal of the waiver was premised on NHTSA's preemption regulations in what EPA explained was a joint rulemaking action. But nothing in section 209(b) can be read as calling for consideration of preemption under EPCA in evaluating waiver requests regardless of whether EPA engaged in joint rulemaking with another agency or acted alone. Specifically, under section 209(b), EPA must grant California a waiver of the preemption contained in section 209(a) unless the Administrator makes a finding under any one of the listed criteria: "The Administrator shall . . . waive application of the preemption in section 209(a) if the Administrator finds any of the following: '(A) [California's] determination [that its standards in the aggregate will be at least as protective] is arbitrary and capricious, (B) [California] does not need such State standards to meet compelling and extraordinary conditions, or (C) such State standards and accompanying enforcement procedures are not consistent with section [202(a)].'"<sup>396</sup> Evaluation of preemption under EPCA is not a listed criterion.

Nor did SAFE 1 premise preemption under EPCA on any of the three statutory criteria. In the ACC program waiver request, CARB made a protectiveness finding that, as a quantitative matter, its standards, in the aggregate, were as protective as the Federal standards and did not address preemption under EPCA.<sup>397</sup> In fact, while California might opt to respond to comments on preemption under EPCA, California would not be expected to take it into account in any protectiveness finding made for a waiver request. It bears note that California's practice is not unusual because there are other factors and provisions of the CAA that California does not account for in making its protectiveness finding under section 209(b)(1).<sup>398</sup> In granting the ACC program waiver request, EPA found that California's protectiveness finding was

neither arbitrary nor capricious.<sup>399</sup> EPA also responded to comments on the consideration of preemption under EPCA in granting the waiver but dismissed such objections as outside the scope of its review.<sup>400</sup> Historically, EPA draws a comparison between the numerical stringency of California and federal standards in making the requisite finding as to whether California's protectiveness determination is arbitrary and capricious.<sup>401</sup> Thus, neither California's initial request, nor EPA's waiver grant, considered preemption under EPCA and as previously explained in the ACC program waiver, EPA declined to consider preemption under EPCA viewing it as outside the scope of Agency review.

SAFE 1 made clear that consideration of and reliance on preemption under EPCA was the consequence of regulations promulgated by NHTSA. As SAFE 1 also acknowledged, however, EPA does not "administer" EPCA; that task falls to NHTSA.<sup>402</sup> Instead, "[i]f EPA concludes that California's standards [meet section 209(b)], it is obligated to approve California's waiver application."<sup>403</sup> EPA therefore disagrees with the comment that *Massachusetts* provides the Agency special duty to consider preemption under EPCA in a joint rulemaking action in reviewing waiver requests. In *Massachusetts*, the Supreme Court recognized the potential overlap between NHTSA's and EPA's statutory obligations and concluded that "there is no reason to think the two agencies cannot both administer their obligations yet avoid inconsistency."<sup>404</sup> As one commenter noted, EPA and NHTSA have previously engaged in joint actions that addressed fuel economy and GHG emissions. In those actions, NHTSA's role has been to set national fuel economy standards and EPA's role has been to set national GHG

standards.<sup>405</sup> These roles are complementary, but distinct. The Court acknowledged the independence of these roles in *Massachusetts*: "EPA has been charged with protecting the public's 'health' and 'welfare,' 42 U.S.C. 7521(a)(1), a statutory obligation wholly independent of DOT's mandate to promote energy efficiency. See Energy Policy and Conservation Act, § 2(5), 89 Stat. 874, 42 U.S.C. 6201(5)."<sup>406</sup>

Regarding the Agency's simultaneous pronouncement that reliance on preemption under EPCA would be a singular exercise that would not be repeated, statutory support or past precedent for this singular consideration was also lacking.<sup>407</sup> In fact, this singular exercise would allow for EPA to evaluate the same waiver request differently and depending on EPA's own choice—the choice to act with another agency or not—rather than on the merits of the waiver request itself within specified criteria in section 209(b). Again, the result of this unique application of EPA's authority is unsupported under section 209(b)(1).

As previously noted, EPCA is generally administered by NHTSA and consideration of preemption under EPCA in reviewing waiver requests would for instance call for EPA to resolve the much debated and differing views as to what is a "law or regulation related to fuel economy," as contemplated by 39 U.S.C. 32919(a).<sup>408</sup> Relevant judicial precedent would also appear to call into question whether California's GHG standards and ZEV sales mandates are indeed preempted under EPCA.<sup>409</sup> But as previously explained, EPA does not implement EPCA, and the Agency's review of waiver requests is highly deferential.

EPA also disagrees with comments that the Agency must generally consider factors outside the criteria listed in section 209(b), including preemption under EPCA, regardless of the joint- or single-agency nature of the action. EPA

<sup>399</sup> 78 FR at 2125.

<sup>400</sup> *Id.* at 2145.

<sup>401</sup> Section 209(b)(2) provides that if each State [California] standard is at least as stringent as comparable applicable Federal standards then such standard shall be deemed to be as protective of public health and welfare as such federal standards for purposes of section 209(b)(1)(A). EPA acknowledges that in 1977 Congress amended the waiver provision to allow for California to address its unique combination of air quality problems and that California only be required to demonstrate stringency in the aggregate and that therefore some pollutant standards may not be as stringent.

<sup>402</sup> 84 FR at 51338 ("EPA agrees with commenters that EPA is not the agency that Congress has tasked with administering and interpreting EPCA. This is especially so because '[t]he waiver proceeding produces a forum ill-suited to the resolution of constitutional claims.' *MEMA I*, 627 F.2d at 1115.").

<sup>405</sup> In its most recent rulemaking addressing GHG emissions from light-duty vehicles, EPA extensively coordinated with NHTSA on details of the program but did not conduct it as a joint rulemaking. See 86 FR 74434, 74436 (December 30, 2021).

<sup>406</sup> *Massachusetts*, 549 U.S. at 497, 532.

<sup>407</sup> "EPA does not intend in future waiver proceedings concerning submissions of California programs in other subject areas to consider factors outside the statutory criteria in section 209(b)(1)(A)–(C)." 84 FR at 51338.

<sup>408</sup> EPA takes no position on any role NHTSA might play under 42 U.S.C. 32919(a) and acknowledges that NHTSA discusses this in its recent final rulemaking. See generally 86 FR 74236.

<sup>409</sup> See, e.g., *Cent. Valley Chrysler-Jeep, Inc. v. Goldstene*, 529 F. Supp. 2d 1151, 1153–54 (E.D. Cal. 2007), as corrected Mar. 26, 2008; *Green Mountain Chrysler Plymouth Dodge Jeep v. Crombie*, 508 F. Supp. 2d 295, 300–01 (D. Vt. 2007).

<sup>396</sup> CAA section 209(b)(1)(A)–(C).

<sup>397</sup> 2012 Waiver Request at 15–17.

<sup>398</sup> For example, "California is not required to comply with section 207 to get a waiver." *MEMA II*, 142 F.3d 449, 467 (D.C. Cir. 1989).

has never claimed that it has such broad authority to consider factors outside section 209(b) and the decades of waiver practice, as well as judicial precedent, are indicative of the Agency's narrow scope of review for California waiver requests: "[T]he Administrator has consistently held since first vested with the waiver authority, [that] his inquiry under section 209 is modest in scope. He has no 'broad and impressive' authority to modify California regulations."<sup>410</sup> Instead, EPA has consistently declined to consider factors outside the three statutory criteria listed in section 209(b).<sup>411</sup> This limited scope of review has been repeatedly upheld by the courts. For example, in *MEMA I*, the D.C. Circuit stated that "there is no such thing as a 'general duty' on an administrative agency to make decisions based on factors other than those Congress expressly or impliedly intended the agency to consider."<sup>412</sup> In *MEMA II*, the D.C. Circuit again rejected consideration of a factor outside the 209(b) statutory criteria because doing so would restrict California's ability to "exercise broad discretion."<sup>413</sup>

Commenters also claim that ignoring NHTSA's finding of preemption would violate the Supremacy Clause of the Constitution because the necessary consequence of NHTSA's conclusion in SAFE 1 is that certain standards were void *ab initio* as preempted under EPCA and as such that "the state mandates referenced in [California's] petition for reconsideration are not even eligible to be considered for a CAA waiver of preemption."<sup>414</sup> EPA disagrees. As the D.C. Circuit has held, "[t]hat [the Administrator] like every other administrative officer owes allegiance to the Constitution does not mean that he is required to issue rulings of constitutional dimension."<sup>415</sup> Thus, "[n]othing in section 209 requires [the Administrator] to consider the constitutional ramifications of the

regulations for which California requests a waiver."<sup>416</sup>

Moreover, consideration of factors beyond those set out in section 209(b)(1) would subject California and vehicle and engine manufacturers to changes in regulatory schemes by other federal agencies not acting under the authority of the CAA.<sup>417</sup> SAFE 1 and subsequent events perfectly encapsulate this problem. For instance, NHTSA has since finalized the repeal of the regulatory provisions and pronouncements it made in SAFE 1 that were the underpinnings for EPA withdrawing certain aspects of the ACC program waiver and with that action the Agency's basis for revocation of the waiver under EPCA has now evaporated.<sup>418</sup> Additionally, this is affirmation of EPA's long held view that waiver proceedings are not the appropriate venue for resolving these issues, and the joint-rulemaking context is not and should never have been justification for deviating from statutory authority and the Agency's historical practice.

It also bears note that consideration of factors beyond the criteria contained in section 209(b) would not be limited to preemption under EPCA. Commenters suggested, for instance, that EPA would not be able to "ignore the First Amendment," in the hypothetical situation where California impos[ed] standards on some manufacturers in retaliation for their voiced opposition to California's authority as well as criminality such as "bribery and extortion had been instrumental in assembling the legislative majorities."<sup>419</sup> In short, under the commenter's view, factors for consideration in waiver proceedings would be innumerable. And yet these factors bear little or no relation to specific criteria in section 209(b) that would otherwise warrant the denial of a waiver request. The D.C. Circuit has already, several times, held that EPA is not required to consider factors outside of and unconnected to these statutory criteria, especially constitutional objections. In fact, regarding the commenter's example, the court has already specifically rejected consideration of the First Amendment

<sup>416</sup> *Id.* at 1115.

<sup>417</sup> "The manufacture of automobiles is a complex matter, requiring decisions to be made far in advance of their actual execution. The ability of those engaged in the manufacture of automobiles to obtain clear and consistent answers concerning emission controls and standards is of considerable importance so as to permit economies in production." S. Rep. No. 403, 90th Cong., at 730 1st Sess. (1967).

<sup>418</sup> See 86 FR 74236.

<sup>419</sup> CEI at 11.

in waiver evaluations. In *MEMA I*, the court considered and upheld EPA's decision declining to consider a First Amendment objection to a waiver as beyond the scope of agency review.<sup>420</sup> Courts have also rejected objections based on the applicability of CAA section 207 to California waiver requests<sup>421</sup> and the Commerce Clause.<sup>422</sup> EPA is therefore not persuaded by these arguments. Additionally, courts have long held that administrative proceedings for California waiver requests are ill-suited for consideration of constitutional issues. Nothing precludes commenters from challenging California's standards themselves—whether under EPCA, another statute, or the Constitution—in other, better-suited fora. According to the D.C. Circuit, for instance, [w]hile nothing in section 209 categorically forbids the Administrator from listening to constitutionality-based challenges, petitioners are assured through a petition of review . . . that their contentions will get a hearing."<sup>423</sup> The D.C. Circuit has also repeatedly stated that challenges which go to the legality of California's standards themselves, are better addressed directly by either courts or Congress.<sup>424</sup> Challenges based on preemption under EPCA similarly go to the legality of California's standards themselves and are thus more appropriate in court or addressed to Congress.

#### E. Conclusion

Because the landscape of federal law has changed since SAFE 1 due to NHTSA's repeal of its regulatory text, appendix, and pronouncements regarding EPCA preemption in SAFE 1, EPA believes that it is appropriate to rescind its waiver withdrawal actions in SAFE 1 that were predicated on the federal law context created by NHTSA's SAFE 1 action. On separate grounds, EPA also believes that, based on the foregoing, EPA should not have deviated from its practice of limiting its waiver review to the criteria in section

<sup>420</sup> *MEMA I*, 627 F.2d 1095, 1115 (D.C. Cir. 1979).

<sup>421</sup> *MEMA II*, 142 F.3d 449, 467 (D.C. Cir. 1998).

<sup>422</sup> *ATA v. EPA*, 600 F.3d 624, 628 (D.C. Cir. 2010) ("EPA's only role is to review California's proposed rules under a narrowly defined set of statutory criteria."); *OOIDA v. EPA*, 622 Fed. Appx. 4, 5 (D.C. Cir. 2015) (rejecting a challenge for lack of jurisdiction because challengers objected to California's regulations themselves, not EPA's approval of them in a waiver under 209(b)).

<sup>423</sup> *MEMA I*, 627 F.2d at 1115.

<sup>424</sup> *Id.* at 1105. In *ATA v. EPA*, the D.C. Circuit rejected a constitutional challenge to a California waiver, concluding that Congress made the decision to give California "the primary role in regulating certain mobile pollution sources" so the challenger's argument was best directed to Congress. 600 F.3d 624, 628 (D.C. Cir. 2010).

<sup>410</sup> *MEMA I*, 627 F.2d 1095, 1119 (D.C. Cir. 1979).

<sup>411</sup> See, e.g., 43 FR at 32184 (rejecting objections to the procedures at state level, objections that section 207(c)(3)(A) establishes field protection, and constitutional objections all as beyond the "narrow" scope of the Administrator's review); 74 FR at 32783 (declining to consider EPCA preemption, stating that "section 209(b) of the Clean Air Act limits our authority to deny California's requests for waivers to the three criteria therein."); 79 FR at 46264 (reiterating that EPA can only deny a waiver request based on the 209(b) statutory criteria, dismissing comments on preemption under EPCA, as well as the Constitution and the implications of the FAAAA).

<sup>412</sup> 627 F.2d at 1116.

<sup>413</sup> 142 F.3d at 464.

<sup>414</sup> NADA at 3.

<sup>415</sup> *MEMA I*, 627 F.2d at 1114–15.

209(b)(1). Thus, for the reasons stated above, EPA is rescinding those portions of SAFE 1 that withdrew the waiver of the ACC program on the basis of preemption under EPCA.

### VII. EPA Inappropriately Set Forth an Interpretive View of Section 177 in SAFE 1

In SAFE 1, EPA provided an interpretive view of section 177 of the CAA, stating that states adopting California's new motor vehicle emission standards (section 177 states) could not adopt California's GHG standards.<sup>425</sup> In this action, EPA determines that it was both inappropriate and unnecessary within a waiver proceeding to provide an interpretive view of the authority of section 177 states to adopt California standards, as EPA plays no statutory approval role in connection with states' adoption of standards identical to those standards for which a waiver has been granted to California.<sup>426</sup> Rather, if a state chooses to submit such standards for inclusion in an SIP, EPA's role with regard to approval of these standards is to review them in the same way that EPA reviews all SIP revisions a state submits, via a notice and comment process, to ensure that the submission meets all statutory and regulatory requirements as part of the Agency's decision whether to approve or disapprove the submission. Therefore, the Agency is rescinding the interpretive views on section 177 set out in SAFE 1.

#### A. SAFE 1 Interpretation

In the SAFE proposal, EPA proposed to conclude that "States may not adopt California's GHG standards pursuant to section 177 because the text, context, and purpose of section 177 support the conclusion that this provision is limited to providing States the ability, under certain circumstances and with certain conditions, to adopt and enforce standards designed to control criteria pollutants to address NAAQS nonattainment."<sup>427</sup> Additionally, the proposal noted the title of section 177 ("New motor vehicle emission standards in nonattainment areas") indicates a limited scope of application.<sup>428</sup> The proposal also suggested that, because "[a]reas are only designated nonattainment with respect to criteria pollutants," it would be

"illogical" if states could use their 177 authority "to adopt California standards that addressed environmental problems other than nonattainment of criteria pollutant standards."<sup>429</sup>

In the SAFE 1 decision, EPA finalized its proposed interpretive view, reiterating that "the text (including both the title and main text), structural location, and purpose of the provision confirm that it does not apply to GHG standards."<sup>430</sup> Because section 177's title references nonattainment areas, and because nonattainment designations only exist for criteria pollutants, EPA claimed, states could not adopt standards for purposes of GHG control under section 177.<sup>431</sup>

As evidence for this interpretive view, EPA again pointed to the text and location of the section, which had been the basis for the Agency's interpretation in the SAFE proposal. EPA acknowledged commenters who argued that "CAA section 177 does not contain any text that could be read as limiting its applicability to certain pollutants only" and that EPA had "inappropriately relied on the heading for CAA section 177 to construe a statutory provision as well as arrogated authority to implement an otherwise self-implementing provision," but disagreed with these commenters.<sup>432</sup> In addition to the evidence relied on in the proposal, EPA provided examples of legislative history from the 1977 amendments to support its interpretive view.<sup>433</sup>

#### B. Notice of Reconsideration of SAFE 1 and Request for Comment

Acknowledging that "section 177 does not require States that adopt California emission standards to submit such regulations for EPA review" and that "California in previous waiver requests has addressed the benefits of GHG emissions reductions as it relates to ozone," EPA sought comment in the 2021 Notice of Reconsideration on whether EPA had the authority in the

SAFE 1 context to interpret section 177 of the CAA and whether the interpretive view was appropriate.<sup>434</sup> Specifically, EPA sought comment on whether it was appropriate for EPA to provide an interpretive view of section 177 within the SAFE 1 proceeding.<sup>435</sup> To the extent it was appropriate to provide an interpretation, EPA sought comment on whether section 177 was properly interpreted and whether California's motor vehicle emission standards adopted by states pursuant to section 177 may have both criteria emission and GHG emission benefits and purposes.<sup>436</sup>

#### C. Comments Received

In response to SAFE 1, EPA received multiple petitions for reconsideration. One petition submitted by several states and cities asserted that, in adopting its interpretation of section 177, EPA "relie[d] on information and reasoning not presented in the SAFE Proposal," particularly the "superseded version of Section 172 . . . and legislative history for that outdated provision."<sup>437</sup> The petition noted that the use of this information and reasoning was used in the SAFE 1 to conclude that "section 177 is in fact intended for NAAQS attainment planning and not to address global air pollution."<sup>438</sup> Petitioners argued that because this information and reasoning was not presented in the proposal, "EPA should withdraw and reconsider its finalization of the Section 177 interpretation and allow for full and fair public comment before proceeding further."<sup>439</sup>

EPA also received many comments in response to the Notice of Reconsideration of SAFE 1, both supporting and opposing EPA's statements regarding section 177 in SAFE 1. Supporters of SAFE 1 reiterated the reasoning from the proposal and final action.<sup>440</sup> For example, one commenter wrote, "In short, 'the text, context, and purpose of Section 177 suggest' that the provision is limited to motor vehicle standards 'designed to control criteria pollutants to address NAAQS nonattainment.'" <sup>441</sup> Like the SAFE proposal and final action, the commenter stated that in addition to the text and context of the section, there is "substantial legislative history showing that Congress's purpose in creating the Section 177 program was to address

<sup>425</sup> 84 FR at 51310, 51350.

<sup>426</sup> EPA is aware of instances of States adopting California new motor vehicle emission standards and not subsequently including such standards in their SIP. In these circumstances EPA has not played and would not play an approval role.

<sup>427</sup> 83 FR at 43240.

<sup>428</sup> *Id.*

<sup>429</sup> *Id.*

<sup>430</sup> 84 FR at 51350.

<sup>431</sup> *Id.*

<sup>432</sup> *Id.*

<sup>433</sup> In particular, EPA cited legislative history on section 172(b), which set forth the "requisite provisions" for state plans for nonattainment areas. *Id.* at 51350 n.286. According to the legislative history, one of the many factors that must be considered by a state plan is "actual emissions of such pollutant resulting from in-use motor vehicles." *Id.* (quoting H.R. Rep. No. 294, 95th Cong., 1st Sess. 212 (1977), 1977 U.S.C.C.A.N. 1077, 1291, 1997 WL 16034). Therefore, EPA claimed, this legislative history "identifies section 177 as a means of addressing the NAAQS attainment planning requirements of CAA section 172, including the specific SIP content and approvals criteria for EPA." *Id.* at 51351.

<sup>441</sup> CEI at 18 (quoting heavily from the SAFE proposal and SAFE final action).

non-attainment with NAAQS for criteria pollutants, not to address any global atmospheric phenomenon.”<sup>442</sup>

Opponents of SAFE 1 argued both that EPA had no authority to issue its 177 statement and that the merits of EPA’s argument were wrong. On the issue of authority, opponents of SAFE 1 claimed that SAFE 1 failed to consider the reliance interests of the stakeholders, particularly section 177 states.<sup>443</sup> SAFE 1, they argued, upset this reliance and created uncertainty.<sup>444</sup> A substantial number of commenters also argued that EPA had no authority to make its statements on section 177 because “Congress gave EPA no role in implementing Section 177 and no authority to constrain States’ decisions regarding adoption of California emissions standards.”<sup>445</sup>

<sup>442</sup> *Id.*

<sup>443</sup> States and Cities at 50–55; Institute for Policy Integrity Amicus Brief at 22–26 (“[T]he fact that California and many other states have detrimentally relied on this waiver to meet federal and state air-pollution mandates resolves any lingering doubt about the lawfulness of EPA’s Action. . . . Revoking the preemption waiver . . . jeopardizes the state’s ability to meet federal standards for other harmful air pollutants, since the standards covered by the waiver would have reduced—directly and indirectly—nitrogen-oxide, ozone, and particulate-matter pollution. See 78 FR 2122, 2129, and 2134.”); Tesla at 11–13; National Association of Clean Air Agencies (NACAA), Docket No. EPA–HQ–OAR–2021–0257–0096 at 3. Many of the 177 states had also provided comments, during the SAFE 1 comment period, explaining that they have adopted the ACC program standards to meet their public health goals. See, e.g., Maryland Department of the Environment, Docket No. EPA–HQ–OAR–2018–0283–5831 at 2–3; Delaware Department of Natural Resources and Environment Control, Docket No. EPA–HQ–OAR–2018–0283–5066 at 3–5; Massachusetts Department of Environmental Protection, Docket No. EPA–HQ–OAR–2018–0283–5476; State of California et al., Docket No. EPA–HQ–OAR–2018–0283–5481 at 130–31 (California was joined by the States of Connecticut, Delaware, Hawaii, Iowa, Illinois, Maine, Maryland, Minnesota, New Jersey, New Mexico, New York, North Carolina, Oregon, Rhode Island, Vermont, Washington, the Commonwealths of Massachusetts, Pennsylvania, and Virginia, the District of Columbia, and the Cities of Los Angeles, New York, Oakland, San Francisco, and San Jose).

<sup>444</sup> See, e.g., States and Cities at 50–55; Tesla at 11–13.

<sup>445</sup> States and Cities at 51. See also Tesla at 11–13; Twelve Public Interest Organizations app. 1 at 2; NESCAUM at 8–9; Southern Environmental Law Center (SELC), Docket No. EPA–HQ–OAR–2021–0257–0125 at 2–3; NCAT at 12; Class of ‘85, Docket No. EPA–HQ–OAR–2021–0257–0454 (correction to an earlier comment by the same commenter, which can be found at Docket No. EPA–HQ–OAR–2021–0257–0388) at 5–6; Maine at 2; OTC at 2. Ironically, one supporter of SAFE 1, while arguing that EPA cannot consider GHG reductions from section 177 states in its second prong analysis, acknowledged EPA’s lack of an oversight role under section 177: “EPA cannot consider GHG reductions, if any, attributable to ‘opt-in’ states under Section 177, as these are out of the scope of a waiver application. Indeed, EPA has no legal role in reviewing opt-in states, as the statute grants the agency no role in reviewing opt-in by other states.” AFPM at 15.

On the merits of EPA’s SAFE 1 argument, opponents of the action commented that EPA misinterpreted section 177 and that, even if EPA’s interpretive view were correct, EPA misapplied it. Multiple commenters wrote that the text of section 177 does not limit the types of pollutants for which motor vehicle emission standards can be authorized.<sup>446</sup> Commenters also noted that the title of section 177 refers to geographic *areas*, not pollutants, and argued that the restriction was therefore on which states could adopt California standards (states with plan provisions approved under Part D) not on the pollutants for which those states could adopt standards.<sup>447</sup> A few commenters also argued that EPA’s section 177 interpretive view would create a “third vehicle” scenario, in contradiction of section 177’s identicality requirement.<sup>448</sup> Even if EPA’s interpretation were correct, opponents continued, California’s standards have both criteria emission and GHG emission benefits and purposes.<sup>449</sup> Commenters cited the factual record as well as EPA’s own past findings as evidence of the connection between GHG standards and NAAQS attainment.

#### *D. Analysis: EPA Is Rescinding SAFE 1’s Interpretive Views of Section 177*

EPA is withdrawing its non-regulatory and non-binding interpretation of section 177 set forth in SAFE 1. EPA plays no statutory approval role in connection with states’ adoption of standards identical to those standards for which the Agency has granted a waiver to California.<sup>450</sup> Rather, if a state chooses to submit such standards for inclusion in a SIP, EPA’s role with regard to approval of these standards is

<sup>446</sup> See, e.g., States and Cities at 53; NESCAUM at 9; NCAT at 12.

<sup>447</sup> See, e.g., States and Cities at 53 (“[T]he reference in the title to ‘nonattainment areas’ is not a limitation to ‘nonattainment (i.e., criteria) pollutants’ or standards that target them” but rather a limitation on the states that can adopt California’s standards); NESCAUM at 9; SELC at 2; NCAT at 12.

<sup>448</sup> Commenters feared that EPA’s interpretation, which “prevents Section 177 States from adopting California’s GHG standards, but not any other California standards,” could require states to “extract just the GHG portion of the Advanced Clean Cars rules from their programs, thus potentially creating type of ‘third vehicle’ forbidden by Section 177 (i.e., a vehicle subject to a hybrid combination of the other California standards and the (now weakened) federal GHG standards.” States and Cities at 54. See also NESCAUM at 11–12; SELC at 5.

<sup>449</sup> States and Cities at 31–32, 50–55; NESCAUM at 12–13; SELC at 5; NCAT at 12; Class of ‘85 at 4–5.

<sup>450</sup> EPA is aware of instances of States adopting California new motor vehicle emission standards and not subsequently including such standards in their SIP. In these circumstances EPA has not played and would not play an approval role.

to review them in the same way that EPA reviews all SIP revisions a state submits, via a notice and comment process, to ensure that the submission meets all statutory and regulatory requirements as part of the Agency’s decision whether to approve or disapprove the submission.<sup>451</sup>

In reconsidering SAFE 1, EPA now believes that it was inappropriate to offer an interpretive view of section 177 in the context of that action. EPA believes it acted inappropriately in providing an interpretive view in SAFE 1 and that such action was based on an inaccurate assessment of the factual record. EPA’s interpretive view was not compelled by any petition, request, or legislative or judicial mandate and was otherwise not final agency action.<sup>452</sup> EPA is therefore rescinding the interpretive views contained in SAFE 1.

As commenters have noted, section 177 does not describe a direct approval role for EPA. Section 177 says that “any State which has plan provisions approved under this part may adopt and enforce” identical California standards and delineates three specific criteria for adoption.<sup>453</sup> Nothing in this language or in the text of the rest of the section requires or allows EPA to approve such adoption and enforcement or directs EPA to implement the section through regulation; EPA plays no statutory approval role in the adoption of California standards by other states other than action on a SIP revision, should those states include the standards in their plans. In fact, there are only three prerequisites to adoption and enforcement by a state: That the state has a federally approved SIP, that the standards are identical (thus the state standards must not create or have the effect of creating a “third vehicle”) to California standards for which California has received a waiver, and that California and the state adopt the standards with at least two years lead time.<sup>454</sup> This limited role has been

<sup>451</sup> EPA notes that although section 177 states that “. . . any State which has plan provisions approved under this part may adopt and enforce for any model year standards relating to control of emissions from new motor vehicles . . .” the language in section 177 does not require a state to submit its adopted motor vehicle emissions standards for SIP approval.

<sup>452</sup> 84 FR at 51338 n.256 (“EPA acknowledges that its actions in this document may have implications for certain prior and potential future EPA reviews of and actions on state SIPs. . . . EPA will consider whether and how to address those implications, to the that they exist, is separate actions.”). EPA action on a state plan (including application of Section 177) is subject to judicial review. 42 U.S.C. 7607(b)(1).

<sup>453</sup> 42 U.S.C. 7507.

<sup>454</sup> *Id.*

acknowledged by courts and EPA alike.<sup>455</sup> Thus, it is well established that states have broad discretion to adopt California standards without being subject to EPA's approval.<sup>456</sup>

States with approved SIPs that have adopted the waived California standard into state law may submit a SIP revision that includes that adopted standard. In that proceeding, EPA could determine whether the statutory criteria for adoption are met for purposes of approving a SIP revision. Indeed, in the litigation following SAFE 1, EPA acknowledged that its interpretive view of section 177 would have no actual effect until applied in a future SIP context.<sup>457</sup> SIPs are a crucial planning tool in helping states reach attainment for NAAQS and California's standards are key components of many of these SIPs.<sup>458</sup> In a SIP proceeding, these states

<sup>455</sup> In 1979, for example, only two years after the adoption of section 177, the D.C. Circuit stated that the Act only requires the three listed prerequisites, "not . . . that the EPA administrator conduct a separate waiver proceeding for each state that chooses [to adopt California standards]." *Ford Motor Co. v. EPA*, 606 F.2d 1293, 1298 (D.C. Cir. 1979). Similarly, in 1994, while enacting rules implementing section 209(e)(2)(B), the parallel provision for the nonroad vehicle section of the California Waiver program, EPA noted that section 177 states had not "ask[ed] for EPA authorization before they adopted the California standards, nor did EPA or the automobile industry suggest that they needed such authorization." 56 FR 36969, 36983 (1994). See also 77 FR 62637 n.54 ("States are not required to seek EPA approval under the terms of section 177.").

<sup>456</sup> EPA also notes that there are ample judicial avenues to directly challenge state adoption of California standards. For example, the First and Second Circuits have already addressed objections to the adoption of California standards under section 177. In both *Am. Auto. Mfrs. Ass'n v. Mass. DEP and Motor Vehicle Mfrs. Ass'n v. NYSDEC*, petitioners argued that the States' adoption of California's low emission vehicles standards without the associated clean fuels plan violated section 177. 31 F.3d 18 (1st Cir. 1994); 17 F.3d 521 (2d Cir. 1994).

<sup>457</sup> Several commenters on the Notice of Reconsideration argued that SAFE 1 violated conformity rules by interfering with already approved SIPs. However, as EPA explained in the litigation over SAFE 1, the action had no actual effect on "either existing approvals of state plans or the plans themselves for criteria pollutants." Final Brief for Respondents at 106, *Union of Concerned Scientists v. NHTSA*, No. 19-1230 (D.C. Cir. Oct. 27, 2020). See also 84 FR 51338, n.256.

<sup>458</sup> Wisconsin at 1 ("These standards provide important and necessary reductions in both GHG and criteria pollutant emissions needed to meet state and local air quality goals and address federal CAA requirements."); Connecticut at 2 ("These programs enable long-term planning and yield critical emission reductions that are critical to meeting Connecticut's climate goals as well as our statutory obligations to reach attainment with the ozone NAAQS."); Delaware at 2 ("Delaware adopted the California LEV regulation and incorporated the LEV and GHG standards into the State Implementation Plan. . . . Delaware will not meet air quality goals without more protective vehicle emission standards."); Maine at 1 ("[T]he LEV program was initially created to help attain

and other stakeholders are better able to provide specific and comprehensive comments about the intent and effect of adopting California standards.<sup>459</sup>

For these reasons, EPA believes that it was inappropriate to provide an interpretive view of section 177 in SAFE 1.<sup>460</sup> Therefore, EPA is withdrawing its SAFE 1 interpretive view of section 177.

### E. Conclusion

EPA determines that it was both inappropriate and unnecessary, within the SAFE 1 waiver proceeding, to provide an interpretive view of the authority of section 177 states to adopt California standards. Therefore, EPA withdraws its interpretive views that had been set forth in SAFE 1.

## VIII. Other Issues

### A. Equal Sovereignty

As explained in Section VI, EPA must grant California's waiver request unless the Agency makes one of the specified findings in section 209(b)(1). In this instance, Congress has made multiple determinations through its adoption of section 209 and subsequent amendments, dating from 1967 through the 1990 CAA Amendments, regarding California's role and its relation to federal standard setting for mobile sources. EPA's longstanding waiver practice, consistent with case law, has been to refrain from considering factors beyond section 209(b)(1) criteria as well as constitutional claims in the review of California waiver requests.<sup>461</sup> EPA

and maintain the health-based National Ambient Air Quality Standards (NAAQS) . . . The California ZEV and GHG programs enable long-term planning for both the states and the regulated community and have been drivers of technological change across the industry.").

<sup>459</sup> The Agency has considered whether there may be any reliance interests on EPA's previous interpretive view of section 177 described in the SAFE 1 action. EPA is unaware of any such interests, and none were raised in comments.

<sup>460</sup> To the extent that EPA's reasoning in its SAFE 1 section 177 determination lacked fair notice, as the States and Cities' Petition claimed, such a contention is rendered moot by this action.

<sup>461</sup> EPA has declined to consider constitutional challenges to California Waivers since at least 1976. 41 FR 44212 (Oct. 7, 1976) ("An additional argument against granting the waiver was raised by the Motorcycle Industry Council and Yamaha, who contended that the CARB had violated due process when adopting their standards, by not allowing the manufacturers a fair and full opportunity to present their views at a State hearing. If this argument has any validity, the EPA waiver hearing is not the proper forum in which to raise it. Section 209(b) does not require that EPA insist on any particular procedures at the State level. Furthermore, a complete opportunity was provided at the EPA waiver hearing for the presentation of views."). See also, e.g., 43 FR at 32184 (July 25, 1978) (rejecting objections to the procedures at state level, objections that section 207(c)(3)(A) establishes field protection, and constitutional objections all as beyond the "narrow" scope of the Administrator's review).

acknowledges that California adopts its standards as a matter of law under its police powers,<sup>462</sup> that the Agency's task in reviewing waiver requests is properly limited to evaluating California's request according to the criteria in section 209(b), and that it is appropriate to defer to litigation brought by third parties in other courts, such as state or federal court, for the resolution of constitutionality claims and inconsistency, if any, with other statutes. As further explained this practice flows from the statute and legislative history, which reflect a broad policy deference that is afforded to California to address its serious air quality problems (which are on-going) as well as to drive emission control innovation. And so, EPA has historically declined to consider constitutional issues in evaluating and granting section 209 waivers. In *MEMA I*, the D.C. Circuit rejected a First Amendment challenge to a waiver as outside the scope of review.<sup>463</sup> In 2009, EPA approved a waiver (and authorization) under section 209(e), granting California authority to enforce its Airborne Toxic Control Measure, which established in-use emission performance standards for engines in transport refrigeration units (TRUs) and TRU generator sets.<sup>464</sup> Responding to comments that the waiver reached beyond California's borders in violation of the Dormant Commerce Clause, EPA stated that such considerations are not factors that EPA must consider under section 209(e) because "EPA's review of California's regulations is limited to the criteria that Congress directed EPA to review."<sup>465</sup> This interpretation was upheld by the D.C. Circuit Court of Appeals. The Court agreed with EPA that the commenters had sought to "improperly . . . engraft a type of constitutional Commerce Clause analysis onto EPA's Section 7543(e) waiver decisions that is neither present in nor authorized by the statute."<sup>466</sup>

<sup>462</sup> *Central Valley Chrysler-Jeep, Inc. v. Goldstene*, 529 F.Supp.2d 1151, 1174 ("The waiver provision of the Clean Air Act recognizes that California has exercised its police power to regulate pollution emissions from motor vehicles since before March 30, 1966; a date that predates both the Clean Air Act and EPCA.").

<sup>463</sup> *MEMA I*, 627 F.2d 1095, 1111, 1114-14 (D.C. Cir. 1979).

<sup>464</sup> 74 FR 3030 (January 16, 2009).

<sup>465</sup> Decision Document, EPA-HQ-OAR-2005-0123-0049 at 67.

<sup>466</sup> *ATA v. EPA*, 600 F.3d 624, 628 (D.C. Cir. 2010) (quoting the U.S. brief). In a footnote to this statement, the Court said ATA could attempt to bring a constitutional challenge directly (which would argue that the waiver unconstitutionally burdens interstate commerce) but "express[ed] no view on that possibility." *Id.* at n.1. See also *COIDA v. EPA*, 622 Fed. Appx. 4, 5 (D.C. Cir. 2015)

Consistent with the Agency's long standing practice, the decision on whether to grant the ACC program waiver was based solely on criteria in section 209(b) and the Agency did not either interpret or apply the Equal Sovereignty Doctrine or any other constitutional or statutory provision in that waiver decision.<sup>467</sup>

Although EPA specified issues that it was seeking comment on within the Notice of Reconsideration, commenters nevertheless argued that the Equal Sovereignty Doctrine, which was not one of the identified aspects in that notice, preempts reinstatement of the relevant aspects of the ACC program waiver. According to these commenters, "Section 209, by allowing California and only California to retain a portion of its sovereign authority that the Clean Air Act takes from other States, is unconstitutional and thus unenforceable."<sup>468</sup> Other commenters argued that the Equal Sovereignty doctrine does not apply to the California waiver program. One comment maintained that the holding in *Shelby County v. Holder* is distinguishable from the CAA.<sup>469</sup> California disagreed with

(rejecting a challenge for lack of jurisdiction because challengers objected to the state regulations themselves, not EPA's approval of them in a waiver under 209(b)) ("To the extent there is any tension in our case law surrounding whether we might decide a constitutional claim brought within a broader challenge to an EPA waiver decision, OOIDA does not present us with such a challenge, and we have no occasion to resolve that question here.").

<sup>467</sup> 78 FR at 2145.

<sup>468</sup> Ohio and 15 States, Docket No. EPA-HQ-OAR-2021-0257-0124 at 1. This commenter also stated that "The waiver at issue here, allowing only California to regulate carbon emissions, is not sufficiently related to the problem that Section 209(a) targets, Congress enacted that section to permit California to address local air pollution. But California seeks special treatment for its proposed greenhouse gas targets . . . designed to mitigate climate change—an inherently global interest." *Id.* at 8–9. EPA notes that this characterization of CARB's standards is addressed in Section V.

<sup>469</sup> Twelve Public Interest Organizations at 5 ("Shelby County does not govern here. See Amicus Br. of Prof. Leah Litman 12–17, *Union of Concerned Scientists v. NHTSA*, No. 19–1230 (July 6, 2020) (A–0384). First, Clean Air Act Section 209(b) places no extraordinary burden or disadvantage on one or more States. Rather, the statute benefits California by allowing the exercise of its police power authority to address its particular pollution control needs. Second, the foundation for reserving California's authority has not waned over time. California had in 1967, and continues to have, the Nation's absolute worst air quality. For example, the South Coast air basin, home to 17 million people, typically leads the Nation in ozone (smog) pollution. The American Lung Association's 2021 'State of the Air' report on national air pollution shows that seven of the ten worst areas for ozone pollution in the country are in California, as are six of the worst ten for small particulate matter. Am. Lung Ass'n, *Most Polluted Cities*, <https://www.lung.org/research/sota/city-rankings/most-polluted-cities> (last visited July 2, 2021) (A–0422).").

EPA's characterization of the relevance of the doctrine, commenting that the Supreme Court has only applied the "rarely invoked" doctrine of Equal Sovereignty in the "rare instance where Congress undertook 'a drastic departure from basic principles of federalism' by authorizing 'federal intrusion into sensitive areas of state and local policymaking.'" <sup>470</sup>

As explained in the 2013 ACC program waiver decision, EPA continues to believe that waiver requests should be reviewed based solely on the criteria in section 209(b)(1) and specifically, that the Agency should not consider constitutional issues in evaluating waiver requests.<sup>471</sup> As previously noted in Section VI, the constitutionality of section 209 is not one of the three statutory criteria for reviewing waiver requests, and such objections are better directed to either the courts or Congress. As the D.C. Circuit reasoned in *MEMA I*, "it is generally considered that the constitutionality of Congressional enactments is beyond the jurisdiction of administrative agencies."<sup>472</sup> Although commenters here raise a new constitutional argument—that of Equal Sovereignty rather than the First Amendment or the Dormant Commerce Clause—EPA is no more well-suited to resolve this constitutional objection than it is to resolve previous constitutional objections.<sup>473</sup>

EPA notes that Congress struck a deliberate balance in 1967 when it acknowledged California's serious air quality problems as well as it being a laboratory for the country, and once again in 1977 when Congress continued to acknowledge California's air quality problems as well as problems in other states and decided that California's new motor vehicle standards, once waived by EPA and subject to certain conditions, would be optionally

<sup>470</sup> States and Cities at 41–42.

<sup>471</sup> 78 FR at 2145.

<sup>472</sup> *MEMA I*, 627 F.2d 1095, 1114–15 (D.C. Cir. 1979) (holding that EPA did not need to consider whether California's standards "unconstitutionally burden[ed] [petitioners'] right to communicate with vehicle purchasers."). See also Twelve Public Interest Organizations at 7 ("As regulatory agencies are not free to declare an act of Congress unconstitutional." *Springsteen-Abbott v. SEC*, 989 F.3d 4, 8 (D.C. Cir. 2021), EPA cannot determine whether a statute Congress directed it to implement contravenes the equal-sovereignty principle. Thus, EPA should proceed to rescind the Waiver Withdrawal and leave Ohio's argument for review by an appropriate court.").

<sup>473</sup> See, e.g., *Johnson v. Robison*, 415 U.S. 361, 368, (1974) ("Adjudication of the constitutionality of congressional enactments has generally been thought beyond the jurisdiction of administrative agencies"); *Springsteen-Abbott*, 989 F.3d at 8; *Meredith Corp. v. FCC*, 809 F.2d 863, 872 (D.C. Cir. 1987).

available for all states under section 177 under specified criteria.<sup>474</sup> In striking a balance between one national standard and 51 different state standards, Congress chose to authorize two standards—the federal standard, and California's standards (which other states may adopt). EPA believes this balance reflected Congress's desire for California to serve as a laboratory of innovation and Congress's understanding of California's extraordinary pollution problems on the one hand, and its desire to ensure that automakers were not subject to too many different standards on the other.

In reconsidering the SAFE 1 action and the appropriateness of reinstating the 2013 ACC program waiver, EPA has not considered whether section 209(a) and section 209(b) are unconstitutional under the Equal Sovereignty Doctrine. As in the 2013 ACC program waiver, the decision on whether to grant the waiver and the consequence of a reinstated waiver is based solely on the criteria in section 209(b) and this decision does not attempt to interpret or apply the Equal Sovereignty Doctrine or any other constitutional or statutory provision.

#### B. CARB's Deemed-To-Comply Provision

EPA received comments arguing that California's 2018 clarification to its deemed-to-comply provision "changed important underlying requirements of the original 2012 waiver application" and "EPA cannot reinstate a Clean Air Act waiver for a program that no longer exists."<sup>475</sup> These commenters maintain that California has never sought a waiver for the 2018 amendments or a determination that the change is within the scope of the prior waiver. As such, commenters maintain that EPA lacks a necessary predicate to permit California's enforcement of its amended GHG standards.

Other commenters argued that the "deemed to comply" provision was always conditioned on the federal standards providing GHG reductions that were at least equal to or as protective as California's program and so the 2018 amendments did not substantively change the provision or affect any related reliance interests and instead were designed to clarify the

<sup>474</sup> "§ 177 . . . permitted other states to 'piggyback' onto California's standards, if the state's standards 'are identical to the California standards for which a waiver has been granted for such model year.'" *Motor Vehicle Mfrs. Ass'n v. New York State Dep't of Envtl. Conservation*, 17 F.3d 521, 525 (2d Cir. 1994).

<sup>475</sup> AFPM at 7; Urban Air at 2, 18–19; NADA at 6.

provision.<sup>476</sup> Commenters maintain that CARB adopted “non-substantive amendments for its LEV III regulations to further clarify that the deemed-to-comply provision would only apply if the federal GHG standards remained substantially as they were as of the date of the 2017 Final Determination.”<sup>477</sup> According to these commenters, California adopted these amendments after EPA’s withdrawal of its 2017 Final Determination that had determined that its Federal GHG standards for model years 2022–2025 remained appropriate and instead concluded that the federal standards for model years 2022–2025 may be too stringent and should be revised. EPA notes that after the January 2017 MTE CARB subsequently found that compliance with those federal standards would result in equivalent or greater GHG benefits than originally projected for California.<sup>478</sup> These commenters further maintain that the clarification of the deemed-to-comply provision is immaterial to the reversal of the waiver withdrawal in SAFE 1 because the SAFE 1 action was expressly based on EPA’s decision to rely on NHTSA’s preemption findings and section 209(b)(1)(B) determination, neither of which was based on CARB’s 2018 clarification rulemaking. As such, the commenters maintain that the clarification of the deemed-to-comply provision has no bearing on and does not preclude EPA’s SAFE 1 waiver withdrawal.<sup>479</sup>

As previously explained, under section 209(b)(1) EPA is to grant a waiver of preemption for California to enforce its own standards that would otherwise be preempted under section 209(a). This preemption does not extend to federal standards that are adopted under section 202(a). EPA explained this in responding to comments on the deemed-to-comply provision in the ACC program waiver decision. “[T]he waiver decision affects only California’s emission standards, not the federal standards that exist regardless of EPA’s decision.”<sup>480</sup> This preemptive effect of section 209(a) does not change even when California chooses to allow for compliance with its standards through

federal standards as envisaged by the deemed-to-comply provision.

It also bears note that in SAFE 1, EPA made clear that the 2018 amendment was not a “necessary part of the basis for the waiver withdrawal and other actions that EPA finalizes in this [SAFE1] document.”<sup>481</sup> In the Notice of Reconsideration, EPA neither reopened nor reconsidered elements of the 2013 waiver that were not part of EPA’s findings in SAFE 1.<sup>482</sup> As noted in this decision, EPA has evaluated the factual and legal errors that occurred in SAFE 1. As part of this evaluation, EPA believes it has considered all appropriate and relevant information necessary to its review of issues associated with the second waiver prong or consideration of preemption under EPCA. The Agency also recognizes that it received comments from parties that raised non-germane issues to EPA’s Notice of Reconsideration. EPA did not conduct an analysis of such comments in the context of reconsidering the specific actions taken in SAFE 1. EPA also makes clear that the result of rescinding its part of SAFE 1 is the automatic reinstatement of the waiver granted to California in 2013 for its ACC program. That is the result of the action taken herein.<sup>483</sup>

<sup>481</sup> EPA declined to “take any position at this point on what effect California’s December 2018 amendment to its “deemed to comply” provision . . . [may] have on the continued validity of the January 2013 waiver.” 84 FR at 51329, n.208, 51334, n.230. Although EPA claimed in SAFE 1 that the deemed to comply clarification confirmed and provided further support for the SAFE 1 action, EPA no longer makes this claim to the extent it is relevant in its reconsideration and rescission of SAFE 1. The consequence of this action is the reinstatement of the ACC program waiver issued in 2013 and does not extend to other regulatory developments in California or by EPA that occurred subsequent to that waiver decision.

<sup>482</sup> 86 FR at 22423. In addition to declining to take a position on the effect of California’s 2018 amendments to its “deemed to comply” provision, SAFE 1 did not finalize the withdrawal of the waiver under the first or third waiver prongs. EPA also notes that it has previously responded twice to the comments suggesting that CARB’s deemed-to-comply provision demonstrates that California does not have a need for its own standards. See 78 FR at 2124–25.

<sup>483</sup> EPA acknowledges that motor vehicle emission standards in California as well as federally are periodically clarified, amended, or revised. For example, after California issued its first deemed-to-comply regulation, EPA determined that the state’s GHG standards were within the scope of the 2009 waiver. While EPA believes that Congress intended regulatory certainty to be attached to the Agency’s waivers issued under section 209, EPA acknowledges that conditions may change over time so significantly that it could merit a review of California’s motor vehicle emission program and applicable standards therein or that would prompt California to submit a related waiver request to EPA. As explained in this decision, the conditions associated with the analysis of the three waiver criteria performed in the ACC waiver decision did not change so as to merit the SAFE 1 action. EPA

## IX. Decision

After review of the information submitted by CARB and other public commenters, the SAFE 1 action, and the record pertaining to EPA’s 2013 ACC program waiver, I find that EPA did not appropriately exercise its limited inherent authority to reconsider waiver grants in SAFE 1. SAFE 1 did not correct a clerical or factual error, nor did the factual circumstances and conditions related to the three statutory criteria change prior to SAFE 1, much less change so significantly as to cast the propriety of the waiver grant into doubt. On this basis, I am rescinding the SAFE 1 action.

Furthermore, after review of both the 2013 ACC program waiver record as well as the SAFE 1 record, to the extent that EPA did have authority to reconsider the ACC program waiver, I have determined that the asserted bases were in error and did not justify the waiver withdrawal. With respect to the Agency’s first purported basis—its discretionary decision to undertake a reinterpretation of the second waiver prong—I find that the statutory interpretation adopted in SAFE 1 is a flawed reading of the statute, and I hereby return to the traditional interpretation of the second waiver prong, which is, at least, the better interpretation. Under the traditional interpretation, which looks at the program as a whole, California clearly had a compelling need for the ACC program. Even if SAFE 1’s statutory reinterpretation, which focuses on California’s compelling need for the specific standards, were an appropriate reading, EPA did not perform a reasonable, accurate, and complete review of the factual record in its findings regarding the criteria emission benefits of CARB’s ZEV sales mandate and GHG emission regulations. Upon review, I find that SAFE 1’s predicate for concluding that California did not have a compelling need for these specific standards was not reasonable given the record at the time of the ACC program waiver and once again during the SAFE 1 proceeding. A reasonable, accurate, and complete review of the record supports the need for California’s specific GHG emission standards and ZEV sales mandate to meet compelling and extraordinary conditions in California. This is true whether I look at how these standards reduce criteria pollution, GHG pollution, or both. In

recognizes that federal light-duty vehicle GHG emission standards have been modified twice since SAFE 1 was issued; the current standards do not change EPA’s conclusion that SAFE 1 should be rescinded.

<sup>476</sup> States and Cities at 58–61. (“California always intended its standards would ‘remain an important backstop in the event the national program is weakened or terminated.’ 78 FR at 2,128.”).

<sup>477</sup> *Id.* at 60. “Final Determination on the Appropriateness of the Model Year 2022–2025 Light-Duty Vehicle Greenhouse Gas Emissions Standards under the Midterm Evaluation” (2017 Final Determination) at <https://nepis.epa.gov/Exec/ZyPDF.cgi?Dockey=P100QQ91.pdf>.

<sup>478</sup> 82 FR 14671 (March 22, 2017) and 83 FR 16077 (April 13, 2018).

<sup>479</sup> States and Cities at 60–62.

<sup>480</sup> 78 FR at 2124.

sum, although I am not adopting the interpretation of the second waiver prong set forth in SAFE 1, I find that the burden of proof necessary to demonstrate that CARB's ZEV sales mandate and GHG emission standards are not needed to meet compelling and extraordinary conditions has not been met under either interpretation of the second waiver prong. Therefore, I rescind the Agency's part of the SAFE 1 action to the extent it relied upon the second waiver prong to withdraw the ACC program waiver.

With regard to the applicability of preemption under EPCA, I find that, to the extent EPA's authority to reconsider the ACC program waiver rested upon NHTSA's joint action at the time as well as the applicability of its EPCA interpretation to EPA's review, this statute falls clearly outside the confines of section 209(b) where EPA's authority to grant, deny, and reconsider waivers resides. In any event, the grounds for such action under SAFE 1 no longer exist given NHTSA's recent final action withdrawing its EPCA preemption rule in its entirety.

Each of the decisions and justifications contained in this final action is severable.

This decision rescinds EPA's SAFE 1 action and therefore, as a result, the waiver of preemption EPA granted to California for its ACC program ZEV sales mandates and GHG emission standards issued in 2013, including for the 2017 through 2025 model years, comes back into force.

#### Judicial Review

Section 307(b)(1) of the CAA governs judicial review of final actions by EPA. This section provides, in part, that petitions for review must be filed in the Court of Appeals for the District of Columbia Circuit: (i) When the agency action consists of "nationally applicable regulations promulgated, or final actions taken, by the Administrator," or (ii) when such action is locally or regionally applicable, but "such action is based on

a determination of nationwide scope or effect and if in taking such action the Administrator finds and publishes that such action is based on such a determination." For locally or regionally applicable final actions, the CAA reserves to EPA complete discretion whether to invoke the exception in (ii).

This final action is "nationally applicable" within the meaning of section 307(b)(1). In the alternative, to the extent a court finds this action to be locally or regionally applicable, the Administrator is exercising the complete discretion afforded to him under the CAA to make and publish a finding that this action is based on a determination of "nationwide scope or effect" within the meaning of section 307(b)(1).<sup>484</sup> This action rescinds EPA's final action in SAFE 1, which withdrew a waiver for new motor vehicle greenhouse gas emission standards and ZEV sales mandate granted to California under section 209(b) of the CAA. In addition to California, sixteen other states and the District of Columbia have already adopted California's motor vehicle greenhouse gas standards. The other states are New York, Massachusetts, Vermont, Maine, Pennsylvania, Connecticut, Rhode Island, Washington, Oregon, Minnesota, New Jersey, Nevada, Maryland, Virginia, Colorado, and Delaware.<sup>485</sup> These jurisdictions represent a wide geographic area and fall within eight different judicial circuits.<sup>486</sup> In addition,

<sup>484</sup> In deciding whether to invoke the exception by making and publishing a finding that this final action is based on a determination of nationwide scope or effect, the Administrator has also taken into account a number of policy considerations, including his judgment balancing the benefit of obtaining the D.C. Circuit's authoritative centralized review versus allowing development of the issue in other contexts and the best use of agency resources.

<sup>485</sup> The same states have adopted California's ZEV sales mandate regulation with the exception of Pennsylvania, Washington, and Delaware.

<sup>486</sup> In the report on the 1977 Amendments that revised CAA section 307(b)(1), Congress noted that the Administrator's determination that the "nationwide scope or effect" exception applies would be appropriate for any action that has a

this action will affect manufacturers nationwide who produce vehicles to meet the emissions standards of these states. For these reasons, this final action is nationally applicable or, alternatively, the Administrator is exercising the complete discretion afforded to him by the CAA and hereby finds that this final action is based on a determination of nationwide scope or effect for purposes of section 307(b)(1) and is hereby publishing that finding in the **Federal Register**.

Under CAA section 307(b)(1), petitions for judicial review of this action must be filed in the United States Court of Appeals for the District of Columbia Circuit within 60 days from the date this final action is published in the **Federal Register**.

#### X. Statutory and Executive Order Reviews

As with past waiver decisions, this action is not a rule as defined by Executive Order 12866. Therefore, it is exempt from review by the Office of Management and Budget as required for rules and regulations by Executive Order 12866.

In addition, this action is not a rule as defined in the Regulatory Flexibility Act, 5 U.S.C. 601(2). Therefore, EPA has not prepared a supporting regulatory flexibility analysis addressing the impact of this action on small business entities.

Further, Subtitle E of the Small Business Regulatory Enforcement Fairness Act of 1996, also known as the Congressional Review Act, 5 U.S.C. 801, *et seq.*, does not apply because this action is not a rule for purposes of 5 U.S.C. 804(3).

The proposed interim registration review decisions for the chemicals in the table above were posted to the docket and the public was invited to submit any comments or new information. EPA addressed the comments or information received during the 60-day comment period for the proposed interim decisions in the discussion for each pesticide listed in the table. Comments from the 60-day comment period that were received may or may not have affected the Agency's interim decision. Pursuant to 40 CFR 155.58(c), the registration review case docket for the chemicals listed in the Table will remain open until all actions required in the interim decision have been completed. This document also announces the closure of the registration review case for siduron (Case Number 3130, Docket ID Number EPA-HQ-OPP-2015-0857) because the last U.S. registrations for this pesticide have been canceled.

Background on the registration review program is provided at: <http://www.epa.gov/pesticide-reevaluation>.

**BILLING CODE 6560-50-P**

**ENVIRONMENTAL PROTECTION AGENCY**

[EPA-HQ-OAR-2021-0257; FRL-10022-05-OAR]

**California State Motor Vehicle Pollution Control Standards; Advanced Clean Car Program; Reconsideration of a Previous Withdrawal of a Waiver of Preemption; Opportunity for Public Hearing and Public Comment**

**AGENCY:** Environmental Protection Agency (EPA).

**ACTION:** Notice of Opportunity for Public Hearing and Comment.

**SUMMARY:** The Environmental Protection Agency (EPA) is reconsidering a prior action that withdrew a waiver of

preemption for California's zero emission vehicle (ZEV) mandate and greenhouse gas (GHG) emission standards within California's Advanced Clean Car (ACC) program for purposes of rescinding that action. The ACC program waiver, as it pertains to the GHG emission standards and ZEV mandates, will become effective should EPA rescind the prior action. On September 27, 2019, EPA and the National Highway Transportation Safety Administration (NHTSA) issued an action titled "The Safer Affordable Fuel-Efficient Vehicles Rule Part One: One National Program" (SAFE 1) that included, among other matters, EPA's determination that the Agency had authority to reconsider the ACC program waiver and that elements of the ACC program waiver should be withdrawn due to NHTSA's action under the Energy Policy & Conservation Act (EPCA) and Clean Air Act (CAA) preemption provisions. In addition, SAFE 1 included EPA's interpretation of whether States can adopt California's GHG emission standards under section 177 of the CAA.

EPA believes that there are significant issues regarding whether SAFE 1 was a valid and appropriate exercise of agency authority, including the amount of time that had passed since EPA's 2013 waiver decision, the novel approach and legal interpretations used in SAFE 1, and whether EPA took proper account of the environmental conditions in California and the environmental consequences from the waiver withdrawal in SAFE 1. Further, EPA will be addressing issues raised in several petitions for reconsideration of SAFE 1, including one filed by California (jointly with a number of States and Cities) and one jointly filed by nongovernmental organizations. Finally, on January 20, 2021, President Biden issued an Executive Order on "Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis." The President directed the Federal Agencies to "immediately review" SAFE 1, and to consider action "suspending, revising, or rescinding" that action by April 2021. Therefore, based on the issues

associated with SAFE 1, the petitions for reconsideration, and the Executive Order, this **Federal Register** notice initiates reconsideration of SAFE 1 and announces a virtual public hearing as well as an opportunity to submit new written comment.

**DATES:**

*Comments:* Comments must be received on or before July 6, 2021.

*Public Hearing:* EPA will hold a virtual public hearing on June 2, 2021. Please refer to the **SUPPLEMENTARY INFORMATION** section for additional information on the public hearing. Additional information regarding the virtual public hearing and this action can be found at: <https://www.epa.gov/regulations-emissions-vehicles-and-engines/public-hearing-information-epas-notice-reconsideration>.

**ADDRESSES:** *Comments.* You may send your comments, identified by Docket ID No. EPA-HQ-OAR-2021-0257, by any of the following methods:

- *Federal eRulemaking Portal:* <http://www.regulations.gov> (our preferred method). Follow the online instructions for submitting comments.
- *Email:* [a-and-r-Docket@epa.gov](mailto:a-and-r-Docket@epa.gov). Include Docket ID No. EPA-HQ-OAR-2021-0257 in the subject line of the message.
- *Mail:* U.S. Environmental Protection Agency, EPA Docket Center, Air Docket, Mail Code 28221T, 1200 Pennsylvania Avenue NW, Washington, DC 20460.

• *Hand Delivery or Courier (by scheduled appointment only):* EPA Docket Center, WJC West Building, Room 3334, 1301 Constitution Avenue NW, Washington, DC 20004. The Docket Center's hours of operations are 8:30 a.m.–4:30 p.m., Monday–Friday (except Federal Holidays).

*Instructions:* All submissions received must include the Docket ID No. for this action. Comments received may be posted without change to <https://www.regulations.gov>, including any personal information provided. For the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit

<http://www.epa.gov/dockets/commenting-epa-dockets>.

Out of an abundance of caution for members of the public and our staff, the EPA Docket Center and Reading Room are closed to the public, with limited exceptions, to reduce the risk of transmitting COVID-19. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform. We encourage the public to submit comments via <https://www.regulations.gov> or email, as there may be a delay in processing mail and faxes. Hand deliveries and couriers may be received by scheduled appointment only. For further information on EPA Docket Center services and the current status, please visit us online at <https://www.epa.gov/dockets>.

EPA continues to monitor information carefully and continuously from the Centers for Disease Control and Prevention (CDC), local area health departments, and our Federal partners so that we can respond rapidly as conditions change regarding COVID-19.

**Public Hearing.** The virtual public hearing will be held on June 2, 2021. The hearing will begin at 9:00 a.m. Eastern Time (ET) and end when all parties who wish to speak have had an opportunity to do so. All hearing attendees (including those who do not intend to provide testimony and merely listen) should notify the [SAFE1Hearing@epa.gov](mailto:SAFE1Hearing@epa.gov) email address listed under **FOR FURTHER INFORMATION CONTACT** by May 25, 2021. Once an email is sent to this address you will receive an automatic reply with further information for registration. Be sure to check your clutter and junk mailboxes for this reply. Additional information regarding the hearing appears below under **SUPPLEMENTARY INFORMATION**.

**FOR FURTHER INFORMATION CONTACT:** For questions regarding this proposed action, contact David Dickinson, Office of Transportation and Air Quality, Transportation and Climate Division, Environmental Protection Agency; telephone number: (202) 343-9256; email address: [dickinson.david@epa.gov](mailto:dickinson.david@epa.gov). To register for the virtual public hearing, contact [SAFE1hearing@epa.gov](mailto:SAFE1hearing@epa.gov).

E. The Petitions for Reconsideration  
III. Request for Comments

**I. Participation in Virtual Public Hearing**

Please note that EPA is deviating from its typical approach because the President has declared a national emergency. Because of current CDC recommendations, as well as state and local orders for social distancing to limit the spread of COVID-19, EPA cannot hold in-person public meetings at this time.

EPA will begin pre-registering speakers for the hearing upon publication of this document in the **Federal Register**. To register to speak at the virtual hearing, please contact the email address listed in the **FOR FURTHER INFORMATION CONTACT** section. The last day to pre-register to speak at the hearing will be May 25, 2021.

Each commenter will have 3 minutes to provide oral testimony. EPA may ask clarifying questions during the oral presentations but will not respond to the presentations at that time. EPA recommends submitting the text of your oral comments as written comments to the rulemaking docket. Written statements and supporting information submitted during the comment period will be considered with the same weight as oral comments and supporting information presented at the public hearing. Please note that any updates made to any aspect of the hearing will be posted online at: <https://www.epa.gov/regulations-emissions-vehicles-and-engines/public-hearing-information-epas-notice-reconsideration>.

While EPA expects the hearing to go forward as set forth above, please monitor the website or contact the person listed in the **FOR FURTHER INFORMATION CONTACT** section to determine if there are any updates. EPA does not intend to publish a document in the **Federal Register** announcing updates. A copy of the hearing transcript will be placed into the docket.

If you require the services of a translator or special accommodations such as audio description, please pre-register for the hearing and describe your needs by May 25, 2021. EPA may not be able to arrange accommodations without advance notice.

**II. Background**

EPA is reconsidering a prior action that withdrew the January 9, 2013 waiver of preemption for the state of California's (California) Advanced Clean Car (ACC) program for purposes of rescinding the withdrawal action. The ZEV mandates and GHG emission

standards within the ACC program waiver will come into effect should EPA rescind this prior action.<sup>1</sup>

Specifically, on September 27, 2019, NHTSA and EPA each finalized agency actions that addressed greenhouse gas (GHG) emissions standards for new motor vehicles and zero emissions vehicle (ZEV) mandates in a single **Federal Register** notice titled: "The Safer Affordable Fuel-Efficient Vehicles Rule Part One: One National Program" (SAFE 1).<sup>2</sup> In that notice, NHTSA codified regulatory text, and appendices, that provided its view that state regulation of fuel economy is preempted under the Energy Policy and Conservation Act (EPCA). On its part, EPA withdrew a waiver of preemption that had been previously granted to California for the regulation of motor vehicle emissions through GHG standards and a ZEV mandate. EPA's action also took into consideration preemption regulations issued by NHTSA under EPCA in SAFE 1. On January 20, 2021, President Biden issued an Executive Order 13990 on "Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis." The President directed each Federal agency to "immediately review" SAFE 1, and consider taking action "suspending, revising, or rescinding" it by April 2021.<sup>3</sup> Accordingly, EPA has conducted a review of both the legal and factual predicates for SAFE 1. EPA now believes that there are significant issues with the SAFE 1 action, including the time elapsed since EPA's 2013 waiver decision (and associated reliance interests), the novel statutory interpretations set forth in SAFE 1, and whether EPA took proper account of the environmental conditions in California and the environmental consequences of the waiver withdrawal in SAFE 1. Further, subsequent to SAFE 1, EPA received several petitions for reconsideration, including one filed by California seeking clarification of the scope of the SAFE 1 action, one filed by California (jointly with a number of States and Cities), and one jointly filed by nongovernmental organizations that

<sup>1</sup> 78 FR 2112 (January 9, 2013). EPA's waiver action on January 9, 2013 was for several California emission standards, including the low emission vehicle (LEV) III regulations for criteria pollutants. SAFE 1 withdrew elements of the January 9, 2013 waiver pertaining to certain ZEV mandate and GHG emission standards. Other elements of the ACC program waiver remain in effect.

<sup>2</sup> The SAFE 1 action is at 84 FR 51310 (September 27, 2019).

<sup>3</sup> This action is being issued only by EPA and, therefore, does not bear upon any future or potential action NHTSA may take regarding its decision or pronouncements in SAFE 1.

raised significant issues related to the agency's action in SAFE 1. EPA has evaluated each petition for reconsideration and believes there is merit in reviewing issues that petitioners have raised such as whether the withdrawal of the ACC program waiver was a valid exercise of EPA authority, and whether the Agency properly interpreted and applied the CAA preemption provisions. EPA has notified these petitioners that the agency will be addressing issues raised in their petitions as part of this proceeding.

In considering whether to rescind the action that withdrew portions of the ACC program waiver, EPA is seeking to determine whether it properly evaluated and exercised its authority to reconsider a previous waiver granted to CARB and whether the withdrawal was a valid and appropriate exercise of authority and consistent with judicial precedent.

EPA is providing the following summary of sections of the Clean Air Act that are applicable to the Agency's review of the California Air Resources Board's (CARB's) new motor vehicle emissions program, an overview of CARB's ACC program waiver and subsequent EPA action to withdraw portions of the ACC program waiver pertaining to CARB's GHG emission standards and ZEV mandate in SAFE 1, an overview of prior EPA waiver actions applicable to CARB's GHG emission standards for motor vehicles, and a brief description of the petitions for reconsideration filed with EPA after the completion of SAFE 1 in order to provide the context for agency solicitation of comments, which can be found in section "III. Request for Comments." EPA is not soliciting comments on the 2013 ACC program waiver decision, and therefore has not reopened that decision for comments. Specifically, EPA is not soliciting comments on issues addressed in the ACC program waiver decision beyond those issues addressed in the final SAFE 1 action. EPA will treat any other comments it receives as beyond the scope of this reconsideration proceeding.

#### A. Scope of Preemption and Criteria for a Waiver Under the Clean Air Act

Title II of the Clean Air Act, as amended, generally preempts states from setting emission standards for new motor vehicles. Section 209(a) provides:

No State or any political subdivision thereof shall adopt or attempt to enforce any standard relating to the control of emissions from new motor vehicles or new motor vehicle engines subject to this part. No state shall require

certification, inspection or any other approval relating to the control of emissions from any new motor vehicle or new motor vehicle engine as condition precedent to the initial retail sale, titling (if any), or registration of such motor vehicle, motor vehicle engine, or equipment.<sup>4</sup>

California is the only state that is eligible to seek and receive a waiver of preemption under the terms of section 209(b)(1). This section provides:

The Administrator, after notice and opportunity for public hearing, to waive application of the prohibitions of section 209(a) for any state that has adopted standards (other than crankcase emission standards) for the control of emissions from new motor vehicles or new motor vehicle engines prior to March 30, 1966, if the state determines that the state standards will be, in the aggregate, at least as protective of public health and welfare as applicable Federal standards. No such waiver shall be granted if the Administrator finds that—

(A) the determination of the state is arbitrary and capricious,

(B) the state does not need the state standards to meet compelling and extraordinary conditions, or

(C) the state standards and accompanying enforcement procedures are not consistent with section 202(a) of the Act.<sup>5</sup>

Previous decisions granting California waivers of Federal preemption for motor vehicle emission standards have stated that State standards are inconsistent with section 202(a) if there is inadequate lead time to permit the development of the necessary technology giving appropriate consideration to the cost of compliance within that time period or if the Federal and State test procedures impose inconsistent certification procedures.<sup>6</sup>

EPA has consistently interpreted Section 209(b) to require issuance of a waiver unless EPA finds that at least one of the three criteria is met.<sup>7</sup> As

<sup>4</sup> Section 209(a) of the Clean Air Act, 42 U.S.C. 7543(a).

<sup>5</sup> Section 209(b)(1) of the Clean Air Act, 42 U.S.C. 7543(b)(1).

<sup>6</sup> To be consistent, the California certification procedures need not be identical to the Federal certification procedures. California procedures would be inconsistent, however, if manufacturers would be unable to meet the state and Federal requirements with the same test vehicle during the same test. See, e.g., 43 FR 32182 (July 25, 1978).

<sup>7</sup> This is different from most waiver proceedings before the Agency, where EPA typically determines whether it is appropriate to make certain findings necessary for granting a waiver, and if the findings are not made then a waiver is denied. This reversal of the normal statutory structure embodies and is consistent with the congressional intent of providing deference to California to maintain its own new motor vehicle emissions program. In

noted above, the three waiver criteria are properly seen as the criteria for denial. Prior to SAFE 1, EPA has consistently declined to consider other potential bases for denying a waiver such as Constitutional claims or the preemptive effect of other Federal statutes.<sup>8</sup> In addition, EPA, given the text, legislative history and judicial precedent, has consistently interpreted section 209(b) as placing the burden on the opponents of a waiver to demonstrate that one of the criterion for a denial has been met.<sup>9</sup> Thus, EPA's practice has been to defer and not to intrude in policy decisions made by California in adopting standards for protecting the health and welfare of its citizens.<sup>10</sup>

In 1977, Congress promulgated section 177 of the Clean Air Act, which permitted States to adopt California new motor vehicle emission standards for which a waiver of preemption has been granted if certain criteria are met.<sup>11</sup> Also known as the "opt-in" provision, section 177 of the Act, 42 U.S.C. 7507, provides:

Notwithstanding section 7543(a) of this title, any State which has plan provisions approved under this part may adopt and enforce for any model year standards relating to control of emissions from new motor vehicles or new motor vehicle engines and take such other actions as are referred to in

previous waiver decisions, EPA has recognized that the intent of Congress in creating a limited review based on specifically listed criteria was to ensure that the Federal government did not second-guess state policy choices. See 40 FR 23102, 23103 (May 28, 1975); 78 FR 2112, 2115 (January 9, 2013); 40 FR 23103–23104; see also LEV I waiver at 58 FR 4166 (January 13, 1993), Decision Document at 64. Similarly, EPA has stated its practice of leaving the decision on "ambiguous and controversial matters of public policy" to California's judgment. 78 FR 2112, 2115; 40 FR 23103, 23104; 58 FR 4166.

<sup>8</sup> As EPA has stated on numerous occasions, section 209(b) of the Clean Air Act limits our authority to deny California's requests for waivers to the three criteria therein, and EPA has refrained from denying California's requests for waivers based on any other criteria. Where the Court of Appeals for the District of Columbia Circuit has reviewed EPA decisions declining to deny waiver requests based on criteria not found in section 209(b), the court has upheld and agreed with EPA's determination." 78 FR 2112, 2145 (citing *Motor and Equipment Manufacturers Ass'n v. Nichols (MEMA II)*, 142 F.3d 449, 462–63, 466–67 (D.C. Cir. 1998), *Motor and Equipment Manufacturers Ass'n v. EPA (MEMA I)*, 627 F.2d 1095, 1111, 1114–20 (D.C. Cir. 1979).

<sup>9</sup> *MEMA* at 1120–1121; *MEMA II*.

<sup>10</sup> EPA is "to afford California the broadest possible discretion in selecting the best means to protect the health of its citizens and the public welfare." *MEMA II*, 142 F.3d at 453 (quoting H.R. Rep. No. 95–294, at 301–02 (1977)); EPA "is not to overturn California's judgment lightly," *Id.*, at 463 (quoting H.R. Rep. No. 95–294, at 302 (1977), reprinted in 1977 U.S.C.A.N. at 1381).

<sup>11</sup> *Motor Vehicle Mfrs. Ass'n v. NYS Dep. of Env't Conservation*, 17 F.3d 521, 532 (2d Cir. 1994).

section 7543(a) of this title respecting such vehicles if—

(1) such standards are identical to the California standards for which a waiver has been granted for such model year, and

(2) California and such State adopt such standards at least two years before commencement of such model year (as determined by regulations of the Administrator).

Nothing in this section or in subchapter II of this chapter shall be construed as authorizing any such State to prohibit or limit, directly or indirectly, the manufacture or sale of a new motor vehicle or motor vehicle engine that is certified in California as meeting California standards, or to take any action of any kind to create, or have the effect of creating, a motor vehicle or motor vehicle engine different than a motor vehicle or engine certified in California under California standards (a “third vehicle”) or otherwise create such a “third vehicle”.

#### B. The ACC Program Waiver

On June 27, 2012, CARB notified EPA of its adoption of the ACC program regulatory package that contained amendments to its low-emission vehicle (LEV) and ZEV mandate and requested a waiver of preemption under section 209(b) to enforce regulations pertaining to this program.<sup>12</sup> The ACC program combined the control of smog and soot-causing pollutants and GHG emissions into a single coordinated package of requirements for passenger cars, light-duty trucks, and medium-duty passenger vehicles (and limited requirements related to heavy-duty vehicles for certain model years). On August 31, 2012, EPA issued a notice of opportunity for public hearing and written comment on CARB’s request and solicited comment on all aspects of a full waiver analysis under the criteria of section 209(b) of the CAA.<sup>13</sup> On January 9, 2013, EPA granted California’s request for a waiver of preemption to enforce the ACC program regulations.<sup>14</sup>

Set forth in the ACC program waiver decision is a summary discussion of EPA’s decision to depart from its

traditional interpretation of section 209(b)(1)(B) (the second waiver prong) in the 2008 waiver denial for CARB’s initial GHG standards for certain earlier model years along with EPA’s return to the traditional interpretation in the waiver issued in 2009.<sup>15</sup> The traditional interpretation, which EPA stated is the better interpretation of section 209(b)(1)(B), calls for evaluating California’s need for a separate motor vehicle emission program to meet compelling and extraordinary conditions. Because EPA received comment on this issue during the ACC program waiver proceeding, as it pertained to both CARB’s GHG emission standards and ZEV mandate, the Agency once again recounted the interpretive history associated with standards for both GHG emissions and criteria air pollutants to explain EPA’s belief that section 209(b)(1)(B) should be interpreted the same way for all air pollutants.<sup>16</sup> Applying this approach, and with deference to California, EPA found that it could not deny the waiver under the second waiver prong.<sup>17</sup> Without adopting an alternative interpretation, EPA noted that to the extent that it was appropriate to examine the need for CARB’s GHG standards to meet compelling and extraordinary conditions, EPA had discussed at length in its 2009 GHG waiver decision that California does have compelling and extraordinary conditions directly related to regulations of GHGs.<sup>18</sup> Similarly, to the extent that it was appropriate to examine the need for CARB’s ZEV mandate, EPA noted that the ZEV mandate in the ACC program enables California to meet both its air quality and climate goals into the future. EPA recognized CARB’s coordinated strategies reflected in the ACC program for addressing both criteria pollutants and greenhouse gases and the magnitude of the technology and energy transformation needed to meet such goals.<sup>19</sup> Therefore, EPA determined that to the extent the second waiver criterion

should be interpreted to mean a need for the specific standards at issue, then CARB’s GHG emission standards and ZEV mandate satisfy such a finding.<sup>20</sup>

Also included in the ACC program waiver is a discussion of the technological feasibility of the ACC program GHG emission standards and the ZEV mandate as evaluated under section 209(b)(1)(C).<sup>21</sup>

Further, in response to a comment that the waiver request for GHG emission standards should be denied because GHG standards relate to fuel economy and are expressly preempted by the Energy Policy and Conservation Act (EPCA), EPA explained that section 209(b) of the Act limits the Agency’s authority to deny California’s requests for waivers to the three criteria therein and that the Agency has consistently refrained from denying California’s requests for waivers based on any other criteria. EPA also relied on judicial precedent as support.<sup>22</sup>

#### C. “The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program” (SAFE 1)

In 2018, NHTSA issued a proposal for the next generation of the Congressionally-mandated Corporate Average Fuel Economy (CAFE) standards that must be achieved by each manufacturer for its car and light-duty truck fleet while EPA revisited its light-duty vehicle GHG emissions standards for certain model years in the rulemaking titled: “The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021–2026 Passenger Cars and Light Trucks.”<sup>23</sup> EPA also proposed to withdraw the waiver for the ACC program GHG emission standards and ZEV mandate under both sections 209(b)(1)(B) and (C), based upon the Agency’s exercise of its inherent authority to reconsider a previously granted waiver under the Clean Air Act. As part of EPA’s asserted authority to reconsider that ACC program waiver issued in 2013, EPA noted the changed circumstances including its reassessment of section 209(b)(1)(B) as well as EPA’s new assessment of the feasibility of CARB’s standards under section 209(b)(1)(C). In addition, EPA noted that the proposal presented a unique situation to consider the implications of NHTSA’s proposed

<sup>15</sup> 73 FR 12156 (March 6, 2008); 74 FR 32744 (July 8, 2009).

<sup>16</sup> 78 FR 2112, 2125–2128.

<sup>17</sup> *Id.* at 2129. “CARB has repeatedly demonstrated the need for its motor vehicle program to address compelling and extraordinary conditions in California. As discussed above, the term compelling and extraordinary conditions “does not refer to the levels of pollution directly.” Instead, the term refers primarily to the factors that tend to produce higher levels of pollution—geographical and climatic conditions (like thermal inversions) that, when combined with large numbers and high concentrations of automobiles, create serious air pollution problems. California still faces such conditions.”

<sup>18</sup> *Id.* at 2129–2130.

<sup>19</sup> *Id.* at 2130–2131.

<sup>20</sup> *Id.* at 2129–2131.

<sup>21</sup> *Id.* at 2131–2143.

<sup>22</sup> *Id.* at 2145 (“Where the Court of Appeals for the District of Columbia Circuit has reviewed EPA decisions declining to deny waiver requests based on criteria not found in section 209(b), the court has upheld and agreed with EPA’s determination.” See *MEMA II* at 462–63, *MEMA I* at 1114–20).

<sup>23</sup> 83 FR 42986 (August 24, 2018).

<sup>12</sup> CARB’s June 12, 2012 waiver request (including its attachments) was included in EPA’s Air Docket at EPA–HQ–OAR–2012–0562–0002 *et seq.* The waiver request and attachments have also now been placed in EPA’s Air Docket pertaining to this reconsideration at EPA–HQ–OAR–2021–0257. A complete description of the ACC program, as it existed at the time that CARB applied for the 2013 waiver, can be found in the docket for the January 2013 waiver action, Docket No. EPA–HQ–OAR–2012–0562.

<sup>13</sup> 77 FR 53199 (August 31, 2012).

<sup>14</sup> 78 FR 2112 (January 9, 2013).

conclusion of EPCA preemption for California's GHG emission standards and ZEV mandate. EPA proposed to conclude that state standards preempted under EPCA cannot be afforded a valid section 209(b) waiver and thus also proposed that, if NHTSA finalized its determination regarding California's GHG standards and ZEV mandate, it would be necessary to withdraw the waiver separate and apart from section 209(b)(1)(B) and (C).

On September 27, 2019, EPA and NHTSA published a final action titled: "The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program" (SAFE 1) that promulgated regulations reflecting NHTSA's conclusion that EPCA preempted California's GHG standards and ZEV mandate. In the same action EPA withdrew the waiver of preemption for California to enforce the ACC program GHG and ZEV mandate on two grounds.<sup>24</sup> First, EPA posited that standards preempted under EPCA could not be afforded a valid waiver of preemption under section 209(b). EPA explained that agency pronouncements in the ACC program waiver decision on the historical practice of disregarding the preemptive effect of EPCA in the context of evaluating California's waiver applications "was inappropriately broad, to the extent it suggested that EPA is categorically forbidden from ever determining that a waiver is inappropriate due to consideration of anything other than the 'criteria' or 'prongs' at CAA section 209(b)(1)(B)(A)–(C)."<sup>25</sup> EPA further explained that those pronouncements were made in waiver proceedings where the agency was acting solely on its own in contrast to a joint action with NHTSA such as SAFE 1. Additionally, EPA expressed intentions not to consider factors other than statutory criteria set out in section 209(b)(1)(A)–(C) in future waiver proceedings, but explained that addressing the preemptive effect of EPCA and its implications for EPA's waiver for California standards was called for in SAFE 1 because EPA and NHTSA were coordinating regulatory actions in a single notice.<sup>26</sup>

Second, EPA withdrew the waiver for GHG standards and ZEV mandate on two alternative grounds under the second waiver prong. Specifically, EPA determined that California does not need the GHG standards "to meet compelling and extraordinary conditions," under section 209(b)(1)(B) and even if California does have

compelling and extraordinary conditions in the context of global climate change, California does not "need" the GHG standards, under section 209(b)(1)(B) because they will not meaningfully address global air pollution problems of the type associated with GHG emissions.<sup>27</sup>

EPA premised the agency's finding on a consideration of California's "need" for its own GHG and ZEV programs, instead of the "need" for a separate motor vehicle emission program to meet compelling and extraordinary conditions. In doing so, EPA read "such State standards" in section 209(b)(1)(B) as ambiguous with respect to the scope of agency analysis of California waiver requests and posited that reading this phrase as requiring EPA to only and always consider California's entire motor vehicle program would limit the application of this waiver prong in a way that EPA did not believe Congress intended. EPA further noted that the Supreme Court had found that Clean Air Act provisions may apply differently to GHGs than they do to traditional pollutants in *UARG v. EPA*, 134 S. Ct. 2427 (2014) (partially reversing the GHG "Tailoring" Rule on grounds that the section 202(a) endangerment finding for GHG emissions from motor vehicles did not compel regulation of all sources of GHG emissions under the Prevention of Significant Deterioration and Title V permit programs).

EPA then interpreted section 209(b)(1)(B) as turning on whether there is a particularized, local nexus between (1) pollutant emissions from sources, (2) air pollution, and (3) resulting impact on health and welfare.<sup>28</sup> EPA stated that these elements match the elements of the predicate finding EPA must make before regulating, under section 202(a)(1), and are evident in California's criteria-pollutant problems, which prompted Congress to enact the waiver provision.<sup>29</sup> Under this interpretation, EPA concluded that no such California nexus exists for greenhouse gases: (1) These emissions from California cars are no more relevant to climate-change impacts in the state than emissions from cars elsewhere; (2) the resulting pollution is globally mixed; and (3) climate-change impacts in California are not extraordinary to that state.<sup>30</sup> EPA further determined that "such State standards" in sections 209(b)(1)(B) and (C) should be read consistently, which was a departure from the traditional approach where this phrase is read as

referring back to "in the aggregate" in section 209(b)(1).<sup>31</sup> EPA further reasoned that the most stringent regulatory alternative considered in the 2012 final rule and Final Regulatory Impact Analysis, which would have required a seven percent average annual fleetwide increase in fuel economy for MYs 2017–2025 compared to MY 2016 standards, was forecasted to decrease global temperatures by only 0.02 °C in 2100.<sup>32</sup>

Finally, as support for the determination that California did not need the ZEV mandate requirements to meet compelling and extraordinary conditions, EPA relied on a statement in the ACC program waiver support document where CARB noted that there were no criteria emissions benefit in terms of vehicle (tank-to-wheel) emissions because its LEV III criteria pollutant fleet standard was responsible for those emission reductions.<sup>33</sup>

Regarding burden of proof in waiver proceedings, the agency posited that it was "not necessary to resolve this issue as regardless of whether a preponderance of the evidence or clear and compelling evidence standard is applied, the Agency was concluding that withdrawal of the waiver was appropriate."<sup>34</sup>

EPA did not finalize the withdrawal of the waiver under the third waiver criterion at section 209(b)(1)(C), as proposed, explaining instead that EPA and NHTSA were not finalizing the proposed assessment regarding the technological feasibility of the Federal GHG standards for MY 2021 through 2025 in SAFE 1.<sup>35</sup>

In withdrawing the waiver, EPA asserted that authority to reconsider and withdraw the grant of a waiver for the ACC program was implicit in section 209(b) given that the authority to revoke a waiver is implied in the authority for EPA to grant a waiver. The Agency

<sup>31</sup> *Id.* at 51345.

<sup>32</sup> *Id.* at 51349.

<sup>33</sup> "There is no criteria emissions benefit from including the ZEV proposal in terms of vehicle (tank-to-wheel or TTW) emissions." CARB ACC program waiver request at 15 (May 2012), EPA–HQ–OAR–2012–0562–0004.

<sup>34</sup> 84 FR 51310, 51344 n.268. At proposal, EPA also took comment on the burden of proof in waiver proceedings even though the Agency had initiated reconsideration of the grant of the ACC program waiver and such evidentiary aspects for section 209(b) waivers had long been settled. *Motor and Equip. Mfrs Ass'n. v. EPA*, 627 F.2d 1095, 1121, n.19, 1126 (D.C. Cir. 1979) (*MEMA I*).

<sup>35</sup> 84 FR 51310, 51350. EPA had proposed to determine, as an additional basis for the waiver withdrawal, that new GHG standards and ZEV mandate for 2021 through 2025 model years are not consistent with section 202(a) of the Clean Air Act, including how costs should be properly considered. EPA's waiver for CARB's ACC program, issued in 2013, fully evaluated this criterion.

<sup>24</sup> 84 FR 51310 (September 27, 2019).

<sup>25</sup> *Id.* at 51338.

<sup>26</sup> *Id.*

<sup>27</sup> 84 FR 51310, 51328–51333.

<sup>28</sup> *Id.* at 51339, 51347.

<sup>29</sup> *Id.* at 51339–5134040, 51348–451349.

<sup>30</sup> *Id.*

claimed further support for authority based on the legislative history of section 209(b) and the judicial principle that agencies possess inherent authority to reconsider their decisions:

The legislative history from the 1967 CAA amendments where Congress enacted the provisions now codified in section 209(a) and (b) provides support for this view. The Administrator has “the right . . . to withdraw the waiver at any time [if] after notice and an opportunity for public hearing he finds that the State of California no longer complies with the conditions of the waiver.” S. Rep. No. 50–403, at 34 (1967).<sup>36</sup>

EPA also noted that, subject to certain limitations, administrative agencies possess inherent authority to reconsider their decisions in response to changed circumstances:

It is well settled that EPA has inherent authority to reconsider, revise, or repeal past decisions to the extent permitted by law so long as the Agency provides a reasoned explanation. This authority exists in part because EPA’s interpretations of the statutes it administers “are not carved in stone.” *Chevron U.S.A. Inc. v. NRDC, Inc.*, 467 U.S. 837, 863 (1984). An agency “must consider varying interpretations and the wisdom of its policy on a continuing basis.” *Id.* at 863–64. This is true when, as is the case here, review is undertaken “in response to . . . a change in administration.” *National Cable & Telecommunications Ass’n v. Brand X internet Services*, 545 U.S. 967, 981 (2005). The EPA must also be cognizant where it is changing a prior position and articulate a reasoned basis for the change. *FCC v. Fox Television Stations, Inc.*, 556 U.S. 502, 515 (2009).<sup>37</sup>

EPA opined that the text, structure, and context of section 209(b) support EPA’s interpretation that it has this authority. EPA further asserted that no cognizable reliance interests had accrued sufficient to foreclose EPA’s ability to exercise this authority.<sup>38</sup> EPA stated:

In tying the third waiver prong to CAA section 202(a), Congress gave a clear indication that, in determining whether to grant a waiver request, EPA is to engage in a review that involves a considerable degree of future prediction, due to the expressly future-oriented terms and function of CAA section 202(a). In turn, where circumstances arise that suggest that such predictions may have been inaccurate, it necessarily follows that EPA has authority to revisit

those predictions with regard to rules promulgated under CAA section 202(a), the requirements of that section, and their relation to the California standards at issue in a waiver request, and, on review, withdraw a previously granted waiver where those predictions proved to be inaccurate.<sup>39</sup>

EPA also disagreed with some commenters’ assertions that ostensible reliance interests foreclose withdrawal of the waiver for MY 2021–2025 GHG and ZEV standards.<sup>40</sup> EPA stated that “CAA section 177 States do not have any reliance interests that are engendered by the withdrawal of the waiver for the MY 2021–2025 GHG and ZEV standards.”<sup>41</sup>

In SAFE 1, EPA provided an interpretation of section 177 of the CAA, including the notion that this section does not authorize other states to adopt California’s greenhouse gas emission standards for which EPA had granted a waiver of preemption under section 209(b). Although section 177 does not

require States that adopt California emission standards to submit such regulations for EPA review, EPA chose to nevertheless provide an interpretation that this provision is available only to states with approved nonattainment plans. EPA stated that nonattainment designations exist only as to criteria pollutants and greenhouse gases are not criteria pollutants; therefore, states could not adopt GHG standards under section 177.<sup>42</sup> Notably, California in previous waiver requests has addressed the benefits of GHG emissions reductions as it relates to ozone.

#### D. Prior EPA Waiver Practice

For over fifty years, EPA has evaluated California’s requests for waivers of preemption under section 209(b), primarily considering CARB’s motor vehicle emission program that addresses criteria pollutants.<sup>43</sup> More recently, the Agency has been tasked with determining how section 209(b)(1)(B) should be interpreted and applied in the context of GHG standards and California’s historical air quality problems, including the public health and welfare challenge of climate change. Although the withdrawal and revocation of the waiver for CARB’s ACC program, in SAFE 1, represents a snapshot of this task, it is important to examine EPA’s waiver practice in general, including prior waiver decisions pertaining to CARB GHG emission standards, in order to determine whether EPA properly reconsidered the ACC program waiver and properly applied the waiver criterion in section 209(b)(1)(B) in SAFE 1. A summary of EPA’s historical waiver practice and decisions regarding CARB’s regulation of criteria and GHG emissions, including EPA’s consideration of the second waiver prong, is provided below.

EPA has consistently interpreted and applied the second waiver criterion by

<sup>39</sup> *Id.* at 51332, 51334. As noted above, however, EPA did not withdraw the ACC waiver based on the third waiver prong of Section 209(b). 84 FR at 51334. Further, by way of example, EPA stated that California as well as other parties, such as section 177 states, were on notice that EPA would be conducting a midterm evaluation (MTE) of the Federal GHG emission standards and that such circumstances indicate a lack of sufficient reliance interests to preclude EPA’s reconsideration of the ACC waiver issued in 2013. As relevant here, EPA’s October 15, 2012 rulemaking setting GHG emission standards for 2017 and later model years included a commitment to perform the MTE for the Federal 2022 through 2025 model year standards. 77 FR 62624 (October 15, 2012). The MTE called for EPA to issue a final determination regarding whether the Federal MY 2022–2025 GHG standards remained appropriate under section 202(a). On January 12, 2017, EPA completed the MTE and determined that GHG standards for MY 2022–2025 remained appropriate under section 202(a). Subsequently, EPA withdrew the January 2017 final determination and revised the finding of appropriateness, concluding instead that GHG standards for MY 2022–2025 were not appropriate and, therefore, should be revised. 83 FR 16077 (April 13, 2018).

<sup>40</sup> According to commenters “California, and the section 177 states that have elected to adopt those standards as their own have incurred reliance interests ultimately flowing from those standards. For instance, California has incurred reliance interests because it is mandated to achieve an aggressive GHG emissions reduction target for 2030 . . . “[b]ut EPA provides no justification for applying that change in policy retroactively to upend a five-year old decision to which substantial reliance interests have attached.” 84 FR 51310, 51331, 51334–51335.

<sup>41</sup> *Id.* at 51336. Regarding states that had adopted the GHG standards into state implementation plans (SIPs), under section 177, EPA explained that because “Title I does not call for NAAQS attainment planning as it relates to GHG standards, those States that may have adopted California’s GHG standards and ZEV standards for certain MYs would also not have any reliance interests. 84 FR 51310, 52335. “EPA did, however, acknowledge the possibility of SIP implications arising from the withdrawal of these standards and indicated that the agency would engage in future actions to address those implications. *Id.* at 51338, n. 256.

<sup>42</sup> *Id.* at 51350–51351. Since EPA was offering its views of section 177 in the abstract, its interpretation of section 177 in SAFE 1 did not have direct and appreciable legal consequences and was not a “final action” of the agency.

<sup>43</sup> EPA notes that the 1990 amendments to the Clean Air Act added subsection (e) to section 209. Subsection (e) addresses the preemption of State or political subdivision regulation of emissions from nonroad engines or vehicles. Section 209(e)(2)(A) sets forth language similar to section 209(b) in terms of the criteria associated with EPA waiving preemption, in this instance for California nonroad vehicle and engine emission standards. Congress directed EPA to implement subsection (e). See 40 CFR part 1074. EPA review of CARB requests submitted under section 209(e)(2)(A)(i) includes consideration of whether CARB needs its nonroad vehicle and engine program to meet compelling and extraordinary conditions. See 78 FR 58090 (September 20, 2013).

<sup>36</sup> *Id.* at 51332.

<sup>37</sup> *Id.* at 51333.

<sup>38</sup> *Id.* at 51331–51337.

considering whether California needed a separate mobile source program as compared to the individual standards at issue to meet compelling and extraordinary conditions. As previously noted, this is known as the “traditional approach” of interpreting section 209(b)(1)(B).<sup>44</sup> At the same time, in the event and in response to commenters that have argued that EPA is required to examine the specific standards at issue in the waiver request, EPA’s practice has been to retain the traditional approach but to nevertheless review the specific standards to determine whether California needs such standards. This has not meant that EPA has adopted an “alternative approach” and required a demonstration for the need of specific standards; rather, this additional Agency review has been afforded to address commenters’ concerns. For example, EPA granted an authorization for CARB’s In-use Off-road Diesel Standards (Fleet Requirements) that included an analysis under both approaches.<sup>45</sup>

The task of interpreting and applying section 209(b)(1)(B) to California’s GHG standards and consideration of the state’s historical air quality problems that now include the public health and welfare challenge of climate change began in 2005, with CARB’s waiver request for 2009 and subsequent model years’ GHG emission standards. On March 6, 2008, EPA denied the waiver request based on a new interpretive finding that section 209(b) was intended for California to enforce new motor vehicle emission standards that address local or regional air pollution problems, and an Agency belief that California could not demonstrate a “need” under section 209(b)(1)(B) for standards intended to address global climate change problems. EPA also employed this new alternative interpretation to state a belief that the effects of climate change in California are not compelling and extraordinary in comparison with the rest of the country. Therefore, within this waiver denial, EPA no longer evaluated whether California had a need for its motor vehicle emission program to meet compelling and extraordinary conditions (the traditional interpretation) but rather focused on the specific GHG emission standard in

isolation and not in conjunction with the other motor vehicle emission standards for criteria pollutants.

In 2009, EPA initiated a reconsideration of the 2008 waiver denial based on a belief that significant issues had been raised since the denial of the waiver.<sup>46</sup> The reconsideration resulted in granting CARB a waiver for its GHG emission standards commencing in the 2009 model year.<sup>47</sup> This led to a rejection of the Agency’s novel alternative interpretation of the second waiver prong announced in the previous waiver denial. Instead, EPA returned to its traditional approach of evaluating California’s need for a separate motor vehicle emission program to meet compelling and extraordinary conditions because the agency viewed it as the better interpretation. Under the traditional interpretation of the second waiver prong, EPA found that the opponents of the waiver had not met their burden of proof to demonstrate that California did not need its motor vehicle emission program to meet compelling and extraordinary conditions. EPA also determined that, even if the alternative interpretation were to be applied, the opponents of the waiver had not demonstrated that California did not need its GHG emissions standards to meet compelling and extraordinary conditions.<sup>48</sup> Since then EPA has employed the traditional approach for evaluating California’s need for a separate motor vehicle emissions program in waiver requests. Notably, EPA also relied on the traditional approach in granting the waiver for the ACC program.

Within the context of EPA’s evaluation of the second waiver prong and California’s GHG emission standards for on-highway vehicles, EPA notes the existence of two waivers of preemption for CARB’s heavy-duty tractor-trailer (HD) GHG emission standards.<sup>49</sup> Once again, EPA relied upon its traditional approach of evaluating California’s need for a separate motor vehicle emission program to meet compelling and extraordinary conditions and found that no evidence had been submitted to demonstrate that California no longer

needed its motor vehicle emissions program to meet compelling and extraordinary conditions.<sup>50</sup> EPA’s second waiver for the HD GHG emission standards made a similar finding that California’s compelling and extraordinary conditions continue to exist under the traditional approach for the interpretation of the second waiver criterion.<sup>51</sup>

#### F. Petitions for Reconsideration

After it issued SAFE 1, EPA received multiple petitions for reconsideration urging the agency to reconsider the withdrawal of the ACC program’s GHG standards and ZEV mandate on various grounds. EPA has granted the following petitions for reconsideration of SAFE 1 that were pending before the Agency:<sup>52</sup>

1. A Petition for Clarification/ Reconsideration submitted by the State of California (the California Attorney General and the California Air Resources Board), on October 9, 2019 (California Petition for Clarification).<sup>53</sup> The Petitioner sought both a

<sup>50</sup> Relatedly, California explained the need for these standards based on projected “reductions in NOx emissions of 3.1 tons per day in 2014 and one ton per day in 2020 due to the HD GHG Regulations. California state[d] that these emissions reductions will help California in its efforts to attain applicable air quality standards. California further projects that the HD GHG Regulations will reduce GHG emissions in California by approximately 0.7 million metric tons (MMT) of carbon dioxide equivalent emissions (CO<sub>2</sub>e) by 2020.” 79 FR 46256, 46261.

<sup>51</sup> 81 FR 95982, 95987. At the time of CARB’s Board adoption of the HD Phase I GHG regulation, CARB determined in Resolution 13–50 that California continues to need its own motor vehicle program to meet serious ongoing air pollution problems. CARB asserted that “[t]he geographical and climatic conditions and the tremendous growth in vehicle population and use that moved Congress to authorize California to establish vehicle standards in 1967 still exist today. EPA has long confirmed CARB’s judgment, on behalf of the State of California, on this matter.” (See EPA Air Docket at regulations.gov at EPA–HQ–OAR–2016–0179–0012). In enacting the California Global Warming Solutions Act of 2006, the Legislature found and declared that “Global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California. The potential adverse impacts of global warming include the exacerbation of air quality problems, a reduction in the quality and supply of water to the state from the Sierra snowpack, a rise in sea levels resulting in the displacement of thousands of coastal businesses and residences, damage to the marine ecosystems and the natural environment, and an increase in the incidences of infectious diseases, asthma, and other health-related problems.”

<sup>52</sup> Separately from this action, EPA has notified the Parties to each of the Petitions for Reconsideration and informed them that EPA is initiating an action under the Administrative Procedure Act to reconsider SAFE 1. Copies of EPA’s reply letters can be found in the public docket at EPA–HQ–OAR–2021–0257.

<sup>53</sup> Copies of the petitions for reconsideration can be found in the public docket at EPA–HQ–OAR–2021–0257.

<sup>44</sup> 49 FR 18887, 18890 (May 3, 1984).

<sup>45</sup> 78 FR 58090 (Sept. 20, 2013). The United States Court of Appeals for the Ninth Circuit upheld EPA’s grant of a waiver of preemption under either approach. *Dalton Trucking v. EPA*, No. 13–74019 (9th Cir. 2021) (finding that EPA was not arbitrary in granting the waiver of preemption under either approach). The court opinion noted that “[t]his disposition is not appropriate for publication and is not precedent except as provided by Ninth Circuit Rule 36–3.”

<sup>46</sup> 74 FR 7040 (February 12, 2009).

<sup>47</sup> 74 FR 32744 (July 8, 2009).

<sup>48</sup> *Id.* at 32759–32767. See also 76 FR 34693 (June 14, 2011).

<sup>49</sup> The first HD GHG emissions standard waiver related to certain new 2011 and subsequent model year tractor-trailers. 79 FR 46256 (August 7, 2014). The second HD GHG emissions standard waiver related to CARB’s “Phase I” regulation for 2014 and subsequent model year tractor-trailers. 81 FR 95982 (December 29, 2016).

clarification and reconsideration of the scope of SAFE 1 as it related to the withdrawal of portions of the ACC program waiver. Regarding clarification, the Petitioner cited somewhat contradictory statements in SAFE 1 and indicated that there was confusion regarding model years that were affected by the waiver withdrawal.<sup>54</sup> The Petitioner also requested reconsideration on grounds that the final action relied on analyses and justifications not presented at proposal and thus, was beyond the scope of the proposal.<sup>55</sup>

2. A Petition for Reconsideration was submitted by several States and Cities on November 26, 2019 (States and Cities' Petition).<sup>56</sup> This petition presented several issues, including whether EPA failed to articulate a valid rationale to support its authority to revoke the GHG standards and ZEV mandate and instead relied on facially unclear theories not made available at proposal for public comment.

Petitioners further asserted that EPA unlawfully changed course in SAFE 1 by considering (and relying on) the purported preemptive effect of EPCA, which is outside the confines of section 209(b) and argued that the agency rationale for withdrawing the waiver was flawed. They also disagreed with the Agency's interpretation of section 209(b)(1)(B) and EPA's reassessment of the factual record that existed at the time of the ACC program waiver, which led to a new finding under the second

waiver prong and a new result in SAFE 1. They asserted, for example, that EPA's new reliance on the "endangerment provision" in Section 202(a) does not support EPA's section 209(b)(1)(B) interpretation or conclusion and that the use of the equal sovereignty principle to inform EPA's interpretation of "compelling and extraordinary conditions" was inappropriate. Additionally, Petitioners asserted that EPA should have considered all supporting documentation instead of only considering the 2013 waiver record and that EPA failed to consider new evidence that further demonstrated California's need for GHG emission standards and ZEV mandates to address compelling and extraordinary conditions in California.

3. Petition for Reconsideration by several non-governmental organizations on November 25, 2019 (NGOs' Petition).<sup>57</sup> Petitioners asserted that EPA's reconsideration of the ACC program waiver was not a proper exercise of agency authority and that EPA relied on improper considerations in its decision-making. Petitioners cast the agency's rationale as "pretextual." The NGOs' Petition further noted that EPA did not properly interpret and apply the second waiver prong and markedly ignored new evidence that further demonstrated California's need for its GHG emission standards and ZEV mandates to address compelling and extraordinary conditions in California.<sup>58</sup>

#### V. Request for Comment

When EPA receives new waiver requests from CARB, EPA traditionally publishes a notice of opportunity for public hearing and comment and then, after the comment period has closed, publishes a notice of its decision in the **Federal Register**. EPA believes it is appropriate to use the same procedures for reconsidering SAFE 1. EPA notes that, consistent with caselaw and EPA's past practice for California waivers, this proceeding is subject to the Administrative Procedure Act (APA) and is considered an informal adjudication under the APA. EPA

encourages interested parties to provide comments on the topics below for consideration by EPA, in the context of reconsidering SAFE 1 and reaching a decision on rescinding that prior agency action. As noted below, EPA seeks public comment, in the context of SAFE 1 and now the Agency's reconsideration, on whether the Agency properly exercised its authority in reconsidering the ACC program waiver and whether the second waiver prong at section 209(b)(1)(B) was properly interpreted and applied. Additionally, EPA seeks comment on whether EPA had the authority in the SAFE 1 context to interpret section 177 of the CAA and whether the interpretation was appropriate, as well as whether EPA properly considered EPCA preemption and its effect on California's waiver. EPA will take all relevant comments into consideration before taking final action.

The full waiver analysis, for new waiver requests, includes consideration of the following three criteria: Whether (a) California's determination that its motor vehicle emission standards are, in the aggregate, at least as protective of public health and welfare as applicable Federal standards is arbitrary and capricious, (b) California needs such standards to meet compelling and extraordinary conditions, and (c) California's standards and accompanying enforcement procedures are consistent with section 202(a) of the Clean Air Act.

In contrast, in this instance EPA is not considering an initial waiver request (e.g., the 2012 ACC program waiver request from CARB, which EPA granted long ago, in 2013). Rather, EPA is now in the position of reconsidering the Agency's prior withdrawal of a waiver action (SAFE 1) for the purpose of determining whether the withdrawal was a valid exercise of the Agency's authority and consistent with judicial precedent and whether the agency's action in SAFE 1 should now be rescinded. Relatedly, certain ZEV mandate and GHG emission standards within the ACC program would become effective should EPA rescind SAFE 1.

EPA's purpose in soliciting public comment is to determine whether SAFE 1 was a valid and appropriate exercise of the Agency's authority. EPA is only reconsidering SAFE 1 and not reopening the ACC program waiver decision for comments. Therefore, EPA is not soliciting comments on issues raised and evaluated by EPA in the 2013 ACC program waiver decision that were not raised and evaluated in the final SAFE 1 decision. EPA intends to treat any

<sup>54</sup> The California Petition for Clarification notes "[i]n the Final Actions, EPA makes statements that are creating confusion, and, indeed, appear contradictory, concerning the temporal scope of its action(s)—specifically, which model years are covered by the purported withdrawal of California's waiver for its GHG and ZEV standards. In some places, EPA's statements indicate that it has limited its action(s) to the model years for which it proposed to withdraw and for which it now claims to have authority to withdraw—namely model years 2021 through 2025. In other places, however, EPA's statements suggest action(s) with a broader scope—one that would include earlier model years."

<sup>55</sup> "To the extent that EPA's response to this petition would result in final action(s) beyond the scope of what EPA proposed, or would contain analyses or justifications not included in the Proposal (such as purported justifications for broader withdrawal authority), then EPA must withdraw at least the portion of the Final Actions that extend beyond the Proposal, issue a revised proposal and accept and consider public comment before taking any final action." California Petition for Clarification at 9.

<sup>56</sup> See EPA-HQ-OAR-2021-0257. This Petition was joined by the States of California, Colorado, Connecticut, Delaware, Hawaii, Illinois, Maine, Maryland, Minnesota, Nevada, New Jersey, New Mexico, New York, North Carolina, Oregon, Rhode Island, Vermont, Washington, Wisconsin, Michigan, the Commonwealths of Massachusetts, Pennsylvania, and Virginia, the District of Columbia, and the Cities of Los Angeles, New York, San Francisco, and San Jose..

<sup>57</sup> See EPA-HQ-OAR-2021-0257. This Petition was joined by The Center for Biological Diversity, Chesapeake Bay Foundation, Environment America, Environmental Defense Fund, Environmental Law & Policy Center, Natural Resources Defense Council, Public Citizen, Inc., Sierra Club, and the Union of Concerned Scientists.

<sup>58</sup> Among the comments is a letter from the CARB, dated June 17, 2019, in support of Petitioners' arguments that EPA improperly considered the reliance interests associated with the ACC program waiver and that EPA improperly understood the scope of the need for the ZEV mandate and GHG standards to address a variety of transportation conformity obligations as well as State Implementation Plan planning requirements.

such comments as beyond the scope of this action.

EPA is seeking to determine whether it properly evaluated and exercised its authority in reconsidering a previous waiver granted to CARB and whether the withdrawal was a valid exercise of authority and consistent with judicial precedent. EPA specifically seeks comment on the matters raised in the Petitions for Reconsideration as they pertain to these evaluations.

EPA is interested in any information or comments regarding EPA's inherent or implied authority to reconsider previously granted waivers. In particular, to the extent EPA has such authority, EPA seeks comments as to whether there are particular factors or issues that the Agency is required to take into consideration, and whether EPA properly evaluated such factors when reaching the decision in SAFE 1 to reconsider the ACC program waiver and withdraw elements of it. For example, was it permissible for EPA to withdraw elements of the ACC program waiver over five years after it was issued? Were the grounds EPA provided in SAFE 1 a valid basis for withdrawing the identified elements of the ACC program waiver? Did EPA properly identify and consider any relevant reliance interests, such as the inclusion of GHG emission standards and ZEV mandates in approved SIPs, in its SAFE 1 action? Similarly, are there particular factors or reliance interests that EPA should consider in reconsidering the SAFE 1 action and recognizing the validity of EPA's 2013 ACC program waiver?

EPA's decision to change course and withdraw the ACC program waiver, as it related to CARB's GHG emission standards and EPA's finding that such standards were only designed to address climate change and a global air pollution problem, was based in large part on a new interpretation of section 209(b)(1)(B)—the second waiver prong regarding whether California "needs such standards to meet compelling and extraordinary conditions." EPA is also interested in any new or additional information or comments regarding whether it appropriately interpreted and applied section 209(b)(1)(B) in SAFE 1. For example, was it permissible for EPA to construe section 209(b)(1)(B) as calling for a consideration of California's need for a separate motor vehicle program where criteria pollutants are at issue and a consideration of California's specific standards where GHG standards are at issue?

Likewise, EPA's decision to withdraw the ACC program waiver as it relates to

California's ZEV mandate, based on the same new interpretation and application of the second waiver prong, rested heavily on the conclusion that California only adopted the ZEV program to achieve GHG emission reductions. EPA recognizes that this conclusion, in turn, rested solely on a specific reading of CARB's ACC program waiver request.<sup>59</sup> EPA requests comment on these specific conclusions and readings as well as within the context of environmental conditions in California whether the withdrawal of the ACC program waiver as it applied to the ZEV mandate was permissible and appropriate, under applicable factors identified above and in relevant caselaw.

We also seek comment on EPA's action in SAFE 1 regarding section 177 of the CAA. Specifically, EPA seeks comment on whether it was appropriate for EPA to provide an interpretation of section 177 within the SAFE 1 proceeding. To the extent it was appropriate to provide an interpretation, EPA seeks comment on whether section 177 was properly interpreted and whether California's mobile source emission standards adopted by states pursuant to Section 177 may have both criteria emission and GHG emission benefits and purposes.

As explained above, SAFE 1 represented a unique and unprecedented circumstance where two Federal agencies issued a joint notice and provided separate interpretive opinions regarding their respective federal preemption statutes.<sup>60</sup> Although EPA has historically declined to look beyond the waiver criteria in section 209(b) when deciding the merits of a waiver request from CARB, in SAFE 1 EPA chose not only to void portions of a waiver it had previously granted, but also to evaluate the effect of a pronouncement of preemption under EPCA on an existing Clean Air Act waiver. We seek comment on whether EPA properly considered and withdrew portions of the ACC program waiver pertaining to GHG standards and the ZEV mandate based on NHTSA's EPCA preemption action, including whether EPA has the authority to withdraw an existing waiver based on a new action that is beyond the scope of section 209

of the CAA. Because EPA relied on NHTSA's regulation on preemption, what significance should EPA place on the repeal of that regulation if NHTSA does take final action to do so?

#### *Determination of Nationwide Scope or Effect*

Section 307(b)(1) of the CAA governs judicial review of final actions by EPA. This section provides, in part, that petitions for review must be filed in the Court of Appeals for the District of Columbia Circuit: (i) When the agency action consists of "nationally applicable regulations promulgated, or final actions taken, by the Administrator," or (ii) when such action is locally or regionally applicable, if "such action is based on a determination of nationwide scope or effect and if in taking such action the Administrator finds and publishes that such action is based on such a determination." For locally or regionally applicable final actions, the CAA reserves to EPA complete discretion whether to invoke the exception in (ii).

<sup>61</sup>

In addition to California, thirteen other states and the District of Columbia have adopted California's greenhouse gas standards.<sup>62</sup> The other states are New York, Massachusetts, Vermont, Maine, Pennsylvania, Connecticut, Rhode Island, Washington, Oregon, New Jersey, Maryland, Delaware, and Colorado. These jurisdictions represent a wide geographic area and fall within seven different judicial circuits.

If the Administrator takes final action to revise or rescind SAFE 1, then, in consideration of the effects of SAFE 1 not only on California, but also on those states that had already adopted California's standards under section 177, to the extent a court finds this action to be locally or regionally applicable, the Administrator intends to exercise the complete discretion afforded to him under the CAA to make and publish a finding that this action is based on a determination of

<sup>59</sup> "Regarding the ACC program ZEV mandate requirements, CARB's waiver request noted that there was no criteria emissions benefit in terms of vehicle (tank-to-wheel—TTW) emissions because its LEV III criteria pollutant fleet standard was responsible for those emission reductions." 84 FR at 51330.

<sup>60</sup> The September 27, 2019 joint agency action is properly considered as two severable actions, a rulemaking by NHTSA and a final informal adjudication by EPA.

<sup>61</sup> In deciding whether to invoke the exception by making and publishing a finding that this final action is based on a determination of nationwide scope or effect, the Administrator intends to take into account a number of policy considerations, including his judgment balancing the benefit of obtaining the D.C. Circuit's authoritative centralized review versus allowing development of the issue in other contexts and the best use of agency resources.

<sup>62</sup> In addition, other states are currently in the process of adopting California standards.

“nationwide scope or effect” within the meaning of CAA section 307(b)(1).<sup>63</sup>

Michael S. Regan,  
Administrator.

BILLING CODE 6560-50-P

**FEDERAL COMMUNICATIONS COMMISSION**

[OMB 3060-0562; FRS 22896]

**Information Collection Being Reviewed by the Federal Communications Commission Under Delegated Authority**

**AGENCY:** Federal Communications Commission.

**ACTION:** Notice and request for comments.

**SUMMARY:** As part of its continuing effort to reduce paperwork burdens, and as required by the Paperwork Reduction Act of 1995 (PRA), the Federal Communications Commission (FCC or Commission) invites the general public and other Federal agencies to take this opportunity to comment on the following information collections. Comments are requested concerning: Whether the proposed collection of information is necessary for the proper performance of the functions of the Commission, including whether the information shall have practical utility; the accuracy of the Commission’s burden estimate; ways to enhance the quality, utility, and clarity of the information collected; ways to minimize the burden of the collection of information on the respondents, including the use of automated collection techniques or other forms of information technology; and ways to further reduce the information collection burden on small business

concerns with fewer than 25 employees. The FCC may not conduct or sponsor a collection of information unless it displays a currently valid Office of Management and Budget (OMB) control number. No person shall be subject to any penalty for failing to comply with a collection of information subject to the PRA that does not display a valid OMB control number.

**DATES:** Written PRA comments should be submitted on or before June 28, 2021. If you anticipate that you will be submitting comments but find it difficult to do so within the period of time allowed by this notice, you should advise the contact listed below as soon as possible.

**ADDRESSES:** Direct all PRA comments to Cathy Williams, FCC, via email to *PRA@fcc.gov* and to *Cathy.Williams@fcc.gov*.

**FOR FURTHER INFORMATION CONTACT:** For additional information about the information collection, contact Cathy Williams at (202) 418-2918.

**SUPPLEMENTARY INFORMATION:**

*OMB Control Number:* 3060-0562.  
*Title:* Section 76.916, Petition for Recertification.

*Form Number:* Not applicable.  
*Type of Review:* Extension of a currently approved collection.

*Respondents:* Business or other for-profit entities; State, local or tribal government.

*Number of Respondents and Responses:* 2 respondents; 3 responses.  
*Estimated Time per Response:* 10 hours.

*Frequency of Response:* On occasion reporting requirement; Third party disclosure requirement.

*Obligation to Respond:* Required to obtain or retain benefits. The statutory authority for this information collection is contained in Sections 4(i) and 623 of the Communications Act of 1934, as amended.

*Total Annual Burden:* 30 hours.  
*Total Annual Cost:* No cost.  
*Privacy Act Impact Assessment:* No impact(s).

*Nature and Extent of Confidentiality:* There is no need for confidentiality with this collection of information.

*Needs and Uses:* The information collection requirements contained in 47 CFR 76.916 provide that a franchising authority wishing to assume jurisdiction to regulate basic cable service and associated rates after its request for certification has been denied or revoked, may file a petition for recertification with the Commission. The petition must be served on the cable operator and on any interested party that participated in the proceeding denying or revoking the original certification. Oppositions to petitions may be filed within 15 days after the petition is filed. Replies may be filed within seven days of filing of oppositions.

Federal Communications Commission.

**Marlene Dortch,**

*Secretary, Office of the Secretary.*

Content

## Action

Proposed rule.

## Summary

The EPA is proposing to revoke a May 22, 2020 finding that it is not appropriate and necessary to regulate coal- and oil-fired electric utility steam generating units (EGUs) under Clean Air Act (CAA) section 112, and to reaffirm the Agency's April 25, 2016 finding that it remains appropriate and necessary to regulate hazardous air pollutant (HAP) emissions from EGUs after considering cost. The Agency is also reviewing another part of the May 22, 2020 action, a residual risk and technology review (RTR) of Mercury and Air Toxics Standards (MATS). Accordingly, in addition to soliciting comments on all aspects of this proposal, the EPA is soliciting information on the performance and cost of new or improved technologies that control HAP emissions, improved methods of operation, and risk-related information to further inform the Agency's review of the MATS RTR as directed by Executive Order 13990.

## Dates

Comments must be received on or before April 11, 2022.

**Public hearing:** The EPA will hold a virtual public hearing on February 24, 2022. See SUPPLEMENTARY INFORMATION for information on the hearing.

## Addresses

You may send comments, identified by Docket ID No. EPA-HQ-OAR-2018-0794, by any of the following methods:

- **Federal eRulemaking Portal:** <https://www.regulations.gov/> (our preferred method). Follow the online instructions for submitting comments.
- **Email:** [a-and-r-docket@epa.gov](mailto:a-and-r-docket@epa.gov). Include Docket ID No. EPA-HQ-OAR-2018-0794 in the subject line of the message.
  - Fax: (202) 566-9744. Attention Docket ID No. EPA-HQ-OAR-2018-0794.
  - Mail: U.S. Environmental Protection Agency, EPA Docket Center, Docket ID No. EPA-HQ-OAR-2018-0794, Mail Code 28221T, 1200 Pennsylvania Avenue NW, Washington, DC 20460.
- **Hand/Courier Delivery:** EPA Docket Center, WJC West Building, Room 3334, 1301 Constitution Avenue NW, Washington, DC 20004. The Docket Center's hours of operation are 8:30 a.m.-4:30 p.m., Monday-Friday (except Federal holidays).

**Instructions:** All submissions received must include the Docket ID No. for this rulemaking. Comments received may be posted without change to <https://www.regulations.gov/>, including any personal information provided. For detailed instructions on sending comments and additional information on the rulemaking process, see the SUPPLEMENTARY INFORMATION section of this document. Out of an abundance of caution for members of the public and our staff, the EPA Docket Center and Reading Room are closed to the public, with limited exceptions, to reduce the risk of transmitting COVID-19. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform. We encourage the public to submit comments via <https://www.regulations.gov/> or email, as there may be a delay in processing mail and faxes. Hand deliveries and couriers may be received by scheduled appointment only. For further information on EPA Docket Center services and the current status, please visit us online at <https://www.epa.gov/dockets>.

## For Further Information Contact

For questions about this proposed action, contact Melanie King, Sector Policies and Programs Division (D243-01), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541-2469; and email address: [king.melanie@epa.gov](mailto:king.melanie@epa.gov).

## Supplementary Information

The EPA is proposing to revoke a May 22, 2020 finding that it is not appropriate and necessary to regulate coal- and oil-fired EGUs under CAA section 112, and to reaffirm the Agency's April 25, 2016 finding that it remains appropriate and necessary to regulate HAP emissions from EGUs after considering cost. The 2016 finding was made in response to the U.S. Supreme Court's 2015 *Michigan v. EPA* decision, where the Court held that the Agency had erred by not taking cost into consideration when taking action on February 16, 2012, to affirm a 2000 EPA determination that it was appropriate and necessary to regulate HAP emissions from EGUs. In the same 2012 action, the EPA also promulgated National Emission Standards for Hazardous Air Pollutants (NESHAP) for coal- and oil-fired EGUs, commonly known as the Mercury and Air Toxics Standards or MATS.

Based on a re-evaluation of the administrative record and the statute, the EPA proposes to conclude that the framework applied in the May 22, 2020 finding was ill-suited to assessing and comparing the full range of benefits to costs, and the EPA concludes that, after applying a more suitable framework, the 2020 determination should be withdrawn. For reasons explained in this notice, the EPA further proposes to reaffirm that it is appropriate and necessary to regulate HAP emissions from EGUs after weighing the volume of pollution that would be reduced through regulation, the public health risks and harms posed by these emissions, the impacts of this pollution on

particularly exposed and sensitive populations, the availability of effective controls, and the costs of reducing this harmful pollution including the effects of control costs on the EGU industry and its ability to provide reliable and affordable electricity. This notice also presents information and analysis that has become available since the 2016 finding, pertaining to the health risks of mercury emissions and the costs of reducing HAP emissions, that lend further support for this determination.

The review that led to this proposal is consistent with the direction in Executive Order 13990, "Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis," signed by President Biden on January 20, 2021. In response to the Executive Order, the Agency is also reviewing another part of the May 22, 2020 action, a RTR of MATS. Accordingly, in addition to soliciting comments on all aspects of this proposal, the EPA is soliciting information on the performance and cost of new or improved technologies that control HAP emissions, improved methods of operation, and risk-related information to further inform the Agency's review of the MATS RTR as directed by the Executive Order. Results of the EPA's review of the RTR will be presented in a separate action.

*Participation in virtual public hearing.* Please note that the EPA is deviating from its typical approach for public hearings because the President has declared a national emergency. Due to the current Centers for Disease Control and Prevention (CDC) recommendations, as well as state and local orders for social distancing to limit the spread of COVID-19, the EPA cannot hold in-person public meetings at this time.

The virtual public hearing will be held via teleconference on February 24, 2022 and will convene at 10:00 a.m. Eastern Time (ET) and will conclude at 7:00 p.m. ET. The EPA may close a session 15 minutes after the last pre-registered speaker has testified if there are no additional speakers. For information or questions about the public hearing, please contact the public hearing team at (888) 372-8699 or by email at [SPPDpublichearing@epa.gov](mailto:SPPDpublichearing@epa.gov). The EPA will announce further details at <https://www.epa.gov/stationary-sources-air-pollution/mercury-and-air-toxics-standards>.

The EPA will begin pre-registering speakers for the hearing no later than 1 business day following publication of this document in the Federal Register . The EPA will accept registrations on an individual basis. To register to speak at the virtual hearing, please use the online registration form available at <https://www.epa.gov/stationary-sources-air-pollution/mercury-and-air-toxics-standards> or contact the public hearing team at (888) 372-8699 or by email at [SPPDpublichearing@epa.gov](mailto:SPPDpublichearing@epa.gov). The last day to pre-register to speak at the hearing will be February 18, 2022. Prior to the hearing, the EPA will post a general agenda that will list pre-registered speakers in approximate order at: <https://www.epa.gov/stationary-sources-air-pollution/mercury-and-air-toxics-standards>.

The EPA will make every effort to follow the schedule as closely as possible on the day of the hearing; however, please plan for the hearings to run either ahead of schedule or behind schedule.

Each commenter will have 5 minutes to provide oral testimony. The EPA encourages commenters to provide the EPA with a copy of their oral testimony electronically (via email) by emailing it to [king.melanie@epa.gov](mailto:king.melanie@epa.gov). The EPA also recommends submitting the text of your oral testimony as written comments to the rulemaking docket.

The EPA may ask clarifying questions during the oral presentations but will not respond to the presentations at that time. Written statements and supporting information submitted during the comment period will be considered with the same weight as oral testimony and supporting information presented at the public hearing.

Please note that any updates made to any aspect of the hearing will be posted online at <https://www.epa.gov/stationary-sources-air-pollution/mercury-and-air-toxics-standards>. While the EPA expects the hearing to go forward as set forth above, please monitor our website or contact the public hearing team at (888) 372-8699 or by email at [SPPDpublichearing@epa.gov](mailto:SPPDpublichearing@epa.gov) to determine if there are any updates. The EPA does not intend to publish a document in the Federal Register announcing updates.

If you require the services of a translator or a special accommodation such as audio description, please pre-register for the hearing with the public hearing team and describe your needs by February 16, 2022. The EPA may not be able to arrange accommodations without advanced notice.

*Docket.* The EPA has established a docket for this rulemaking under Docket ID No. EPA-HQ-OAR-2018-0794. <sup>(1)</sup> All documents in the docket are listed in <https://www.regulations.gov/>. Although listed, some information is not publicly available, e.g., Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy. With the exception of such material, publicly available docket materials are available electronically in <https://www.regulations.gov/>.

*Instructions.* Direct your comments to Docket ID No. EPA-HQ-OAR-2018-0794. The EPA's policy is that all comments received will be included in the public docket without change and may be made available online at <https://www.regulations.gov/>, including any personal information provided, unless the comment includes information claimed to be CBI or other information whose disclosure is restricted by statute. Do not submit electronically any information that you consider to be CBI or other information whose disclosure is restricted by statute. This type of information should be submitted by mail as discussed below.

The EPA may publish any comment received to its public docket. Multimedia submissions (audio, video, *etc.*) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. The EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.*, on the Web, cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit <https://www.epa.gov/dockets/commenting-epa-dockets>.

The <https://www.regulations.gov/> website allows you to submit your comment anonymously, which means the EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an email comment directly to the EPA without going through <https://www.regulations.gov/>, your email address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the internet. If you submit an electronic comment, the EPA recommends that you include your name and other contact information in the body of your comment and with any digital storage media you submit. If the EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, the EPA may not be able to consider your comment. Electronic files should not include special characters or any form of encryption and be free of any defects or viruses. For additional information about the EPA's public docket, visit the EPA Docket Center homepage at <https://www.epa.gov/dockets>.

The EPA is temporarily suspending its Docket Center and Reading Room for public visitors, with limited exceptions, to reduce the risk of transmitting COVID-19. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform. We encourage the public to submit comments via <https://www.regulations.gov/> as there may be a delay in processing mail and faxes. Hand deliveries or couriers will be received by scheduled appointment only. For further information and updates on EPA Docket Center services, please visit us online at <https://www.epa.gov/dockets>.

The EPA continues to carefully and continuously monitor information from the CDC, local area health departments, and our Federal partners so that we can respond rapidly as conditions change regarding COVID-19.

*Submitting CBI.* Do not submit information containing CBI to the EPA through <https://www.regulations.gov/> or email. Clearly mark the part or all of the information that you claim to be CBI. For CBI information on any digital storage media that you mail to the EPA, mark the outside of the digital storage media as CBI and then identify electronically within the digital storage media the specific information that is claimed as CBI. In addition to one complete version of the comments that includes information claimed as CBI, you must submit a copy of the comments that does not contain the information claimed as CBI directly to the public docket through the procedures outlined in *Instructions* above. If you submit any digital storage media that does not contain CBI, mark the outside of the digital storage media clearly that it does not contain CBI. Information not marked as CBI will be included in the public docket and the EPA's electronic public docket without prior notice. Information marked as CBI will not be disclosed except in accordance with procedures set forth in title 40 of the Code of Federal Regulations (CFR) part 2. Send or deliver information identified as CBI only to the following address: OAQPS Document Control Officer (C404-02), OAQPS,

U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711, Attention Docket ID No. EPA-HQ-OAR-2018-0794. Note that written comments containing CBI and submitted by mail may be delayed and no hand deliveries will be accepted.

*Preamble acronyms and abbreviations.* We use multiple acronyms and terms in this preamble. While this list may not be exhaustive, to ease the reading of this preamble and for reference purposes, the EPA defines the following terms and acronyms here:

ACI activated carbon injection

- J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

## I. General Information

### A. Executive Summary

On January 20, 2021, President Biden signed Executive Order 13990, “Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis” (86 FR 7037, January 25, 2021). The Executive Order, among other things, instructs the EPA to review the 2020 final action titled, “National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units—Reconsideration of Supplemental Finding and Residual Risk and Technology Review” (85 FR 31286; May 22, 2020) (2020 Final Action) and consider publishing a notice of proposed rulemaking suspending, revising, or rescinding that action. Consistent with the Executive Order, the EPA has undertaken a careful review of the 2020 Final Action, in which the EPA reconsidered its April 25, 2016 supplemental finding (81 FR 24420) (2016 Supplemental Finding). Based on that review, the Agency proposes to find that the decisional framework for making the appropriate and necessary determination under CAA section 112(n)(1)(A) that was applied in the 2020 Final Action was unsuitable because it failed to adequately account for statutorily relevant factors. Therefore, we propose to revoke the May 2020 determination that it is not appropriate and necessary to regulate HAP emissions from coal- and oil-fired EGUs under section 112 of the CAA. We further propose to reaffirm our earlier determinations—made in 2000 (65 FR 79825; December 20, 2000) (2000 Determination), 2012 (77 FR 9304; February 16, 2012) (2012 MATS Final Rule), and 2016—that it is appropriate and necessary to regulate coal- and oil-fired EGUs under section 112 of the CAA.

In 1990, frustrated with the EPA's pace in identifying and regulating HAP, Congress radically transformed its treatment of that pollution. It rewrote section 112 of the CAA to require the EPA to swiftly regulate 187 HAP with technology-based standards that would require all major sources (defined by the quantity of pollution a facility has the potential to emit) to meet the levels of reduction achieved in practice by the best-performing similar sources. EGUs were the one major source category excluded from automatic application of these new standards. EGUs were treated differently primarily because the 1990 Amendments to the CAA (1990 Amendments) included the Acid Rain Program (ARP), which imposed criteria pollution reduction requirements on EGUs. Congress recognized that the controls necessary to comply with this and other requirements of the 1990 Amendments might reduce HAP emissions from EGUs as well. Therefore, under CAA section 112(n)(1)(A), Congress directed the EPA to regulate EGUs if, after considering a study of “the hazards to public health reasonably anticipated to occur as a result of [HAP] emissions by [EGUs] . . . after imposition of the [Acid Rain Program and other] requirements of this chapter,” the EPA concluded that it “is appropriate and necessary” to do so. See CAA section 112(n)(1)(A).

The EPA completed that study in 1998 and, in 2000, concluded that it is appropriate and necessary to regulate HAP emissions from coal- and oil-fired EGUs. See 65 FR 79825 (December 20, 2000). The EPA reaffirmed that conclusion in 2012, explaining that the other requirements of the CAA, in particular the ARP, did not lead to the HAP emission reductions that had been anticipated because many EGUs switched to lower-sulfur coal rather than deploy pollution controls that may have also reduced emissions of HAP. Indeed, the statute contemplated that the EPA would be conducting the required study within 3 years of the 1990 Amendments; but when the EPA re-examined public health hazards remaining after imposition of the Act's requirements in 2012, the Agency accounted for over 20 years of CAA regulation, and EGUs still remained one of the largest sources of HAP pollution. Specifically, in 2012, the EPA concluded that EGUs were the largest domestic source of emissions of mercury, hydrogen fluoride (HF), hydrogen chloride (HCl), and selenium; and among the largest domestic contributors of emissions of arsenic, chromium, cobalt, nickel, hydrogen cyanide, beryllium, and cadmium. The EPA further found that a significant majority of EGUs were located at facilities that emitted above the statutory threshold set for major sources ( e.g., 10 tons per year (tpy) of any one HAP or 25 tpy or more of any combination of HAP). See 77 FR 9304 (February 16, 2012). In 2012, the EPA also established limits for emissions of HAP from coal- and oil-fired EGUs. *Id.*

Many aspects of the EPA's appropriate and necessary determination and the CAA section 112 regulations were challenged in the U.S. Court of Appeals for the District of Columbia Circuit (D.C. Circuit), and all challenges were denied and the finding and standards upheld in full in *White Stallion Energy Center v. EPA*, 748 F.3d 1222 (2014). The Supreme Court granted review on a single issue and, in *Michigan v. EPA*, 576 U.S. 743 (2015), the Court held that the EPA erred when it failed to consider the costs of its regulation in determining that it is appropriate and necessary to regulate HAP emissions from EGUs, and remanded that determination to the D.C. Circuit for further proceedings. Following *Michigan*, in 2016 the EPA issued a Supplemental Finding that it is appropriate and necessary to regulate EGU HAP after considering the costs of such regulation. See 81 FR 24420 (April 25, 2016). In 2020, the Agency reversed that determination. <sup>(2)</sup> In this action, we conclude that the methodology we applied in 2020 is ill-suited to the appropriate and necessary determination because, among other reasons, it did not give adequate weight to the significant volume of HAP emissions from EGUs and the attendant risks remaining after imposition of the other requirements of the CAA, including many adverse health and environmental effects of EGU HAP emissions that cannot be quantified or monetized. We propose, therefore, to revoke the 2020 Final Action.

We further propose to affirm, once again, that it is appropriate and necessary to regulate coal- and oil-fired EGUs under CAA section 112. We first examine the benefits or advantages of regulation, including new information on the risks posed by EGU HAP. We then examine the costs or disadvantages of regulation, including both the costs of compliance (which we explain we significantly overestimated in 2012) and how those costs affect the industry and the public. We then weigh these benefits and costs to reach the conclusion that it is appropriate and necessary to regulate using two alternative methodologies.

Our preferred methodology, as it was in the 2016 Supplemental Finding, is to consider all of the impacts of the regulation—both costs and benefits to society—using a totality-of-the-circumstances approach rooted in the *Michigan* court's direction to “pay[] attention to the advantages *and* disadvantages of [our] decision[.]” 576 U.S. at 753; see *id.* at 752 (“In particular, ‘appropriate’ is ‘the classic broad all-encompassing term that naturally includes consideration of all relevant factors.’”). To help determine the relevant factors to weigh, we look to CAA section 112(n)(1)(A), the other provisions of CAA section 112(n)(1), and to the statutory design of CAA section 112.

Initially, we consider the human health advantages of reducing HAP emissions from EGUs because in CAA section 112(n)(1)(A) Congress directed the EPA to make the appropriate and necessary determination after considering the results of a “study of the hazards to public health reasonably anticipated to occur as a result of [HAP] emissions” from EGUs. See CAA section 112(n)(1)(A). We consider all of the advantages of reducing emissions of HAP ( i.e., the risks posed by HAP) regardless of whether those advantages can be quantified or monetized, and we explain why almost none of those advantages can be monetized. Consistent with CAA section 112(n)(1)(B)'s direction to examine the rate and mass of mercury emissions, and the design of CAA section 112, which required swift reduction of the volume of HAP emissions based on an assumption of risk, we conclude that we should place substantial weight on reducing the large volume of HAP emissions from EGUs—both in absolute terms and relative to other source categories—that, absent MATS, was entering our air, water, and land, thus reducing the risk of

grave harms that can occur as a result of exposure to HAP. Also consistent with the statutory design of CAA section 112, in considering the advantages of HAP reductions, we consider the distribution of those benefits, and the statute's clear goal in CAA section 112(n)(1)(C) and other provisions of CAA section 112 to protect the most exposed and susceptible populations, such as communities that are reliant on local fish for their survival, and developing fetuses. We think it is highly relevant that while EGUs generate power for all, and EGU HAP pollution poses risks to all Americans exposed to such HAP, a smaller set of Americans who live near EGUs face a disproportionate risk of being significantly harmed by toxic pollution. Finally, we also consider the identified risks to the environment posed by mercury and acid-gas HAP, consistent with CAA section 112(n)(1)(B) and the general goal of CAA section 112 to reduce risks posed by HAP to the environment.

We next weigh those advantages against the disadvantages of regulation, principally in the form of the costs incurred to control HAP before they are emitted into the environment. Consistent with the statutory design, we consider those costs comprehensively, examining them in the context of the effect of those expenditures on the economics of power generation more broadly, the reliability of electricity, and the cost of electricity to consumers. These metrics are relevant to our weighing exercise because they give us a more complete picture of the disadvantages to producers and consumers of electricity imposed by this regulation, and because our conclusion might change depending on how this burden affects the ability of the industry to thrive and to provide reliable, affordable electricity to the benefit of all Americans. These metrics are relevant measures for evaluating costs to the utility sector in part because they are the types of metrics considered by the owners and operators of EGUs themselves. See 81 FR 24428 (April 25, 2016). Per CAA section 112(n)(1)(B), we further consider the availability and cost of control technologies, including the relationship of that factor to controls installed under the ARP.

As explained in detail in this document, we ultimately propose to conclude that, weighing the risks posed by HAP emissions from EGUs against the costs of reducing that pollution on the industry and society as a whole, it is worthwhile ( *i.e.*, "appropriate") to regulate those emissions to protect all Americans, and in particular the most vulnerable populations, from the inherent risks posed by exposure to HAP emitted by coal- and oil-fired EGUs. We propose to find that this is true whether we are looking at the record in 2016 ( *i.e.*, information available as of the time of the 2012 threshold finding and rulemaking) or at the updated record in 2021, in which we quantify additional risks posed by HAP emissions from EGUs and conclude that the actual cost of complying with MATS was almost certainly significantly less than the EPA's projected estimate in the 2011 RIA, primarily because fewer pollution controls were installed than projected and because the unexpected increases in natural gas supply led to a dramatic decrease in the price of natural gas.

In the 2016 Supplemental Finding we did not consider non-HAP health benefits that occur by virtue of controlling HAP from EGUs as a relevant factor for our consideration under the preferred approach. However, because the Supreme Court in *Michigan* directed us to consider health and environmental effects beyond those posed by HAP, "including, for instance, harms that regulation might do to human health or the environment," and stressed that "[n]o regulation is 'appropriate' if it does significantly more harm than good," 576 U.S. at 752, we take comment on whether it is reasonable to also consider the advantages associated with non-HAP emission reductions that result from the application of HAP controls as part of our totality-of-the-circumstances approach. In the 2012 MATS Final Rule, we found that regulating EGUs for HAP resulted in substantial health benefits accruing from coincidental reductions in particulate matter (PM) pollution and its precursors. We also projected that regulating EGUs for HAP would similarly result in an improvement in ozone pollution. While we propose to reach the conclusion that HAP regulation is appropriate even absent consideration of these additional benefits, adding these advantages to the weighing inquiry would provide further support for our proposed conclusion that the advantages of regulation outweigh the disadvantages.

We recognize, as we did in 2016, that our preferred, totality-of-the-circumstances approach to making the appropriate and necessary determination is an exercise in judgment, and that "[r]easonable people, and different decision-makers, can arrive at different conclusions under the same statutory provision" (81 FR 24431; April 25, 2016). However, this type of weighing of factors and circumstances is an inherent part of regulatory decision-making, and we think it is a reasonable approach where the factors the statute identifies as important to consider cannot be quantified or monetized.

Next, we turn to our alternative approach of a formal benefit-cost analysis (BCA). This approach independently supports the determination that it is appropriate to regulate EGU HAP. Based on the 2011 Regulatory Impacts Analysis (2011 RIA) <sup>(3)</sup> performed as part of the 2012 MATS Final Rule, the total net benefits of MATS were overwhelming even though the EPA was only able to monetize one of the many benefits of reducing HAP emissions from EGUs. Like the preferred approach, this conclusion is further supported by newer information on the risks posed by HAP emissions from EGUs as well as the actual costs of implementing MATS, which almost certainly were significantly lower than estimated in the 2011 RIA.

Our proposal is organized as follows. In section II.A of this preamble, we provide as background the regulatory and procedural history leading up to this proposal. We also detail, in preamble section II.B, the statutory design of HAP regulation that Congress added to the CAA in 1990 in the face of the EPA's failure to make meaningful progress in regulating HAP emissions from stationary sources. In particular, we point out that many provisions of CAA section 112 demonstrate the value Congress placed on reducing the volume of HAP emissions from stationary sources as much as possible and quickly, with a particular focus on reducing HAP related risks to the most exposed and most sensitive members of the public. This background assists in identifying the relevant statutory factors to weigh in considering the advantages and disadvantages of HAP regulation.

Against this backdrop, we propose to revoke the 2020 Final Action and reaffirm the 2016 determination that it remains appropriate to regulate HAP emissions from EGUs after a consideration of cost. Specifically, in section III.A of this preamble, we review the long-standing and extensive body of evidence, as well as new mercury-related risk analyses performed since 2016, identifying substantial risks to human health and the environment from HAP emissions from coal- and oil-fired EGUs that support a conclusion that regulating HAP emissions from EGUs is appropriate. In preamble section III.B, we analyze information regarding how the power sector elected to comply with MATS, and how our 2012 projections for the cost of regulation almost certainly overestimated the actual costs of the regulation by a significant amount. In preamble section III.C, we explain our reasons for revoking the 2020 Final Action, which applied an ill-suited framework for evaluating cost because it gave little to no weight to the statutory concern with reducing the volume of and risks from HAP emissions to protect even the most exposed and most vulnerable members of the public. In section III.D of this preamble, we describe and apply our preferred, totality-of-the-circumstances approach, giving particular weight to the factors identified in CAA section 112(n)(1) and 112 more generally. We propose to conclude that after considering all of the relevant factors and weighing the advantages of regulation against the cost of doing so, it is appropriate and necessary to regulate EGUs under CAA section 112. In section III.E of this preamble, we propose an alternative formal benefit-cost approach for making the appropriate and necessary determination. Under this approach, we propose to conclude that it remains appropriate to regulate HAP emissions from EGUs after considering cost because the BCA issued with the MATS rule indicated that the total net benefits of MATS were overwhelming even though the EPA was only able to monetize one of many statutorily identified benefits of regulating HAP emissions from EGUs. The new information examined by the EPA with respect to updated science and cost information only strengthens our conclusions under either of these methodologies. Section IV of this preamble notes that because this proposal reaffirms prior determinations and does not impact implementation of MATS, this action, if finalized, would not change those standards.

Finally, in preamble section V, in addition to soliciting comments on all aspects of this proposed action, we separately seek comment on any data or information that will assist in the EPA's ongoing review of the RTR that the Agency completed for MATS in 2020.

#### B. Does this action apply to me?

The source category that is the subject of this proposal is Coal- and Oil-Fired EGUs regulated by NESHAP under 40 CFR 63, subpart UUUUU, commonly known as MATS. The North American Industry Classification System (NAICS) codes for the Coal- and Oil-Fired EGU source category are 221112, 221122, and 921150. This list of NAICS codes is not intended to be exhaustive, but rather provides a guide for readers regarding the entities that this proposed action is likely to affect.

#### C. Where can I get a copy of this document and other related information?

In addition to being available in the docket, an electronic copy of this action is available on the internet. Following signature by the EPA Administrator, the EPA will post a copy of this proposed action at <https://www.epa.gov/stationary-sources-air-pollution/mercury-and-air-toxics-standards>. Following publication in the Federal Register, the EPA will post the Federal Register version of the proposal and key technical documents at this same website.

## II. Background

### A. Regulatory History

In the 1990 Amendments, Congress substantially modified CAA section 112 to address hazardous air pollutant emissions from stationary sources. CAA section 112(b)(1) sets forth a list of 187 identified HAP, and CAA sections 112(b)(2) and (3) give the EPA the authority to add or remove pollutants from the list. CAA section 112(a)(1) and (2) specify the two types of sources to be addressed: major sources and area sources. A major source is any stationary source or group of stationary sources at a single location and under common control that emits or has the potential to emit, considering controls, 10 tpy or more of any HAP or 25 tpy or more of any combination of HAP. CAA section 112(a)(1). Any stationary source of HAP that is not a major source is an area source. <sup>(4)</sup> CAA section 112(a)(2). All major source categories, besides EGUs, and certain area source categories, were required to be included on an initial published list of sources subject to regulation under CAA section 112. See CAA sections 112(a)(1) and (c)(1). The EPA is required to promulgate emission standards under CAA section 112(d) for every source category on the CAA section 112(c)(1) list.

The general CAA section 112(c) process for listing source categories does not apply to EGUs. Instead, Congress enacted a special provision, CAA section 112(n)(1)(A), which establishes a separate process by which the EPA determines whether to add EGUs to the CAA section 112(c) list of source categories that must be regulated under CAA section 112. Because EGUs were subject to other CAA requirements under the 1990 Amendments, most importantly the ARP, CAA section 112(n)(1)(A) directs the EPA to conduct a study to evaluate the hazards to public health that are reasonably anticipated to occur as a result of the HAP emissions from EGUs “after imposition of the requirements of this chapter.” See CAA section 112(n)(1)(A); see also *Michigan v. EPA*, 576 U.S. at 748 (“Quite apart from the hazardous-air-pollutants program, the Clean Air Act Amendments of 1990 subjected power plants to various regulatory requirements. The parties agree that these requirements were expected to have the collateral effect of reducing power plants’ emissions of hazardous air pollutants, although the extent of the reduction was unclear.”). The provision directs that the EPA shall regulate EGUs under CAA section 112 if the Administrator determines, after considering the results of the study, that such regulation is “appropriate and necessary.” CAA section 112(n)(1)(A), therefore, sets a unique process by which the Administrator is to determine whether to add EGUs to the CAA section 112(c) list of sources that must be subject to regulation under CAA section 112.

The study required under CAA section 112(n)(1)(A) is one of three studies commissioned by Congress under CAA section 112(n)(1), a subsection entitled “Electric utility steam generating units.” The first, which, as noted, the EPA was required to consider before making the appropriate and necessary determination, was completed in 1998 and was entitled the *Study of Hazardous Air Pollutant Emissions from Electric Utility Steam Generating Units-Final Report to Congress* (Utility Study). <sup>(5)</sup> The Utility Study contained an analysis of HAP emissions from EGUs, an assessment of the hazards and risks due to inhalation exposures to these emitted pollutants, and a multipathway (inhalation plus non-inhalation exposures) risk assessment for mercury and a subset of other relevant HAP. The study indicated that mercury was the HAP of greatest concern to public health from coal- and oil-fired EGUs. The study also concluded that numerous control strategies were available to reduce HAP emissions from this source category. The second study commissioned by Congress under CAA section 112(n)(1)(B), the Mercury Study Report to Congress (Mercury Study), <sup>(6)</sup> was released in 1997. Under this provision, the statute tasked the EPA with focusing exclusively on mercury, but directed the Agency to look at other stationary sources of mercury emission in addition to EGUs, the rate and mass of emissions coming from those sources, available technologies for controlling mercury and the costs of such technologies, and a broader scope of impacts including environmental effects. As in the Utility Study, the EPA confirmed that mercury is highly toxic, persistent, and bioaccumulates in food chains. Fish consumption is the primary pathway for human exposure to mercury, which can lead to higher risks in certain

populations. The third study, required under CAA section 112(n)(1)(C), directed the National Institute of Environmental Health Sciences (NIEHS) to conduct a study to determine the threshold level of mercury exposure below which adverse human health effects were not expected to occur (NIEHS Study). The statute required that the study include a threshold for mercury concentrations in the tissue of fish that could be consumed, even by sensitive populations, without adverse effects to public health. NIEHS submitted the required study to Congress in 1995.<sup>7</sup> See 76 FR 24982 (May 3, 2011). Later, after submission of the CAA section 112(n)(1) reports and as part of the fiscal year 1999 appropriations, Congress further directed the EPA to fund the National Academy of Sciences (NAS) to perform an independent evaluation of the data related to the health impacts of methylmercury, and, similar to the CAA section 112(n)(1)(C) inquiry, specifically to advise the EPA as to the appropriate reference dose (RfD) for methylmercury. Congress also indicated in the 1999 conference report directing the EPA to fund the NAS Study, that the EPA should not make the appropriate and necessary regulatory determination until the EPA had reviewed the results of the NAS Study. See H.R. Conf. Rep. No. 105-769, at 281-282 (1998). This last study, completed by the NAS in 2000, was entitled Toxicological Effects of Methylmercury (NAS Study),<sup>(8)</sup> and it presented a rigorous peer-review of the EPA's RfD for methylmercury. Based on the results of these studies and other available information, the EPA determined on December 20, 2000, pursuant to CAA section 112(n)(1)(A), that it is appropriate and necessary to regulate HAP emissions from coal- and oil-fired EGUs and added such units to the CAA section 112(c) list of source categories that must be regulated under CAA section 112. See 65 FR 79825 (December 20, 2000) (2000 Determination).<sup>(9)</sup>

In 2005, the EPA revised the original 2000 Determination and concluded that it was neither appropriate nor necessary to regulate EGUs under CAA section 112 in part because the EPA concluded it could address risks from EGU HAP emissions under a different provision of the statute. See 70 FR 15994 (March 29, 2005) (2005 Revision). Based on that determination, the EPA removed coal- and oil-fired EGUs from the CAA section 112(c) list of source categories to be regulated under CAA section 112. In a separate but related 2005 action, the EPA also promulgated the Clean Air Mercury Rule (CAMR), which established CAA section 111 standards of performance for mercury emissions from EGUs. See 70 FR 28605 (May 18, 2005). Both the 2005 Revision and the CAMR were vacated by the D.C. Circuit in 2008. *New Jersey v. EPA*, 517 F.3d 574 (DC Cir. 2008). The D.C. Circuit held that the EPA failed to comply with the requirements of CAA section 112(c)(9) for delisting source categories, and consequently also vacated the CAA section 111 performance standards promulgated in CAMR, without addressing the merits of those standards. *Id.* at 582-84.

Subsequent to the *New Jersey* decision, the EPA conducted additional technical analyses, including peer-reviewed risk assessments on human health effects associated with mercury (2011 Final Mercury TSD)<sup>(10)</sup> and non-mercury metal HAP emissions from EGUs (2011 Non-Hg HAP Assessment).<sup>(11)</sup> Those analyses, which focused on populations with higher fish consumption ( e.g., subsistence fishers) and residents living near the facilities who experienced increased exposure to HAP through inhalation, found that mercury and non-mercury HAP emissions from EGUs remain a public health hazard and that EGUs were the largest anthropogenic source of mercury emissions to the atmosphere in the U.S. Based on these findings, and other relevant information regarding the volume of HAP, environmental effects, and availability of controls, in 2012, the EPA affirmed the original 2000 Determination that it is appropriate and necessary to regulate EGUs under CAA section 112. See 77 FR 9304 (February 16, 2012).

In the same 2012 action, the EPA established a NESHAP, commonly referred to as MATS, that required coal- and oil-fired EGUs to meet HAP emission standards reflecting the application of the maximum achievable control technology (MACT) for all HAP emissions from EGUs.<sup>(12)</sup> MATS applies to existing and new coal- and oil-fired EGUs located at both major and area sources of HAP emissions. An EGU is a fossil fuel-fired steam generating combustion unit of more than 25 megawatts (MW) that serves a generator that produces electricity for sale. See CAA section 112(a)(8) (defining EGU). A unit that cogenerates steam and electricity and supplies more than one-third of its potential electric output capacity and more than 25 MW electric output to any utility power distribution system for sale is also an EGU. *Id.*

For coal-fired EGUs, MATS includes standards to limit emissions of mercury, acid gas HAP, non-mercury HAP metals ( e.g., nickel, lead, chromium), and organic HAP ( e.g., formaldehyde, dioxin/furan). Standards for HCl serve as a surrogate for the acid gas HAP, with an alternate standard for sulfur dioxide (SO<sub>2</sub>) that may be used as a

surrogate for acid gas HAP for those coal-fired EGUs with flue gas desulfurization (FGD) systems and SO<sub>2</sub> continuous emissions monitoring systems that are installed and operational. Standards for filterable PM serve as a surrogate for the non-mercury HAP metals, with standards for total non-mercury HAP metals and individual non-mercury HAP metals provided as alternative equivalent standards. Work practice standards that require periodic combustion process tune-ups were established to limit formation and emissions of the organic HAP.

For oil-fired EGUs, MATS includes standards to limit emissions of HCl and HF, total HAP metals ( e.g., mercury, nickel, lead), and organic HAP ( e.g., formaldehyde, dioxin/furan). Standards for filterable PM serve as a surrogate for total HAP metals, with standards for total HAP metals and individual HAP metals provided as alternative equivalent standards. Periodic combustion process tune-up work practice standards were established to limit formation and emissions of the organic HAP.

Additional detail regarding the types of units regulated under MATS and the regulatory requirements that they are subject to can be found in 40 CFR 63, subpart UUUUU. <sup>(13)</sup> The existing source compliance date was April 16, 2015, but many existing sources were granted an additional 1-year extension of the compliance date for the installation of controls.

After MATS was promulgated, both the rule itself and many aspects of the EPA's appropriate and necessary determination were challenged in the D.C. Circuit. In *White Stallion Energy Center v. EPA*, the D.C. Circuit unanimously denied all challenges to MATS, with one exception discussed below in which the court was not unanimous. 748 F.3d 1222 (D.C. Cir. 2014). As part of its decision, the D.C. Circuit concluded that the "EPA's 'appropriate and necessary' determination in 2000, and the reaffirmation of that determination in 2012, are amply supported by EPA's findings regarding the health effects of mercury exposure." *Id.* at 1245. <sup>(14)</sup> While joining the D.C. Circuit's conclusions as to the adequacy of the EPA's identification of public health hazards, one judge dissented on the issue of whether the EPA erred by not considering costs together with the harms of HAP pollution when making the "appropriate and necessary" determination, finding that cost was a required consideration under that determination. *Id.* at 1258-59 (Kavanaugh, J., dissenting).

The U.S. Supreme Court subsequently granted *certiorari*, directing the parties to address a single question posed by the Court itself: "Whether the Environmental Protection Agency unreasonably refused to consider cost in determining whether it is appropriate to regulate hazardous air pollutants emitted by electric utilities." *Michigan v. EPA*, 135 S. Ct. 702 (Mem.) (2014). In 2015, the U.S. Supreme Court held that "EPA interpreted [CAA section 112(n)(1)(A)] unreasonably when it deemed cost irrelevant to the decision to regulate power plants." *Michigan*, 576 U.S. at 760. In so holding, the U.S. Supreme Court found that the EPA "must consider cost-including, most importantly, cost of compliance-before deciding whether regulation is appropriate and necessary." *Id.* at 2711. It is "up to the Agency," the Court added, "to decide (as always, within the limits of reasonable interpretation) how to account for cost." *Id.* The rule was ultimately remanded back to the EPA to complete the required cost analysis, and the D.C. Circuit left the MATS rule in place pending the completion of that analysis. *White Stallion Energy Center v. EPA*, No. 12-1100, ECF No. 1588459 (D.C. Cir. December 15, 2015).

In response to the U.S. Supreme Court's direction, the EPA finalized a supplemental finding on April 25, 2016, that evaluated the costs of complying with MATS and concluded that the appropriate and necessary determination was still valid. The 2016 Supplemental Finding promulgated two different approaches to incorporate cost into the decision-making process for the appropriate and necessary determination. See 81 FR 24420 (April 25, 2016). The EPA determined that both approaches independently supported the conclusion that regulation of HAP emissions from EGUs is appropriate and necessary.

The EPA's preferred approach to incorporating cost evaluated estimated costs of compliance with MATS against several cost metrics relevant to the EGU sector ( e.g., historical annual revenues, annual capital expenditures, and impacts on retail electricity prices), and found that the projected costs of MATS were reasonable for the sector in comparison with historical data on those metrics. The evaluation of cost metrics that the EPA applied was consistent with approaches commonly used to evaluate environmental policy cost impacts. <sup>(15)</sup> The EPA also examined as part of its cost analysis what the impact of MATS would be on retail electricity prices and the reliability of the power grid. Using a totality-of-the-circumstances approach, the EPA weighed these supplemental findings as to cost against the existing administrative record detailing the identified hazards to public health and the

environment from mercury, non-mercury metal HAP, and acid gas HAP that are listed under CAA section 112, and the other advantages to regulation. Based on that balancing, the EPA concluded under the preferred approach that it remains appropriate to regulate HAP emissions from EGUs after considering cost. See 81 FR 24420 (April 25, 2016) (“After evaluating cost reasonableness using several different metrics, the Administrator has, in accordance with her statutory duty under CAA section 112(n)(1)(A), weighed cost against the previously identified advantages of regulating HAP emissions from EGUs—including the agency’s prior conclusions about the significant hazards to public health and the environment associated with such emissions and the volume of HAP that would be reduced by regulation of EGUs under CAA section 112.”)

In a second alternative and independent approach (referred to as the alternative approach), the EPA considered the BCA in the 2011 RIA for the 2012 MATS Final Rule. *Id.* at 24421. In that analysis, even though the EPA was only able to monetize one HAP-specific endpoint, the EPA estimated that the final MATS rule would yield annual monetized net benefits (in 2007 dollars) of between \$37 billion to \$90 billion using a 3-percent discount rate and between \$33 billion to \$81 billion using a 7-percent discount rate, in comparison to the projected \$9.6 billion in annual compliance costs. See *id.* at 24425. The EPA therefore determined that the alternative approach also independently supported the conclusion that regulation of HAP emissions from EGUs remains appropriate after considering cost. *Id.*

Several state and industry groups petitioned for review of the 2016 Supplemental Finding in the D.C. Circuit. *Murray Energy Corp. v. EPA*, No. 16-1127 (D.C. Cir. filed April 25, 2016). In April 2017, the EPA moved the D.C. Circuit to continue oral argument and hold the case in abeyance in order to give the then-new Administration an opportunity to review the 2016 action, and the D.C. Circuit ordered that the consolidated challenges to the 2016 Supplemental Finding be held in abeyance (*i.e.*, temporarily on hold).<sup>(16)</sup>

Accordingly, the EPA reviewed the 2016 action, and on May 22, 2020, finalized a revised response to the *Michigan* decision. See 85 FR 31286 (May 22, 2020). In the 2020 Final Action, after primarily comparing the projected costs of compliance to the one post control HAP emission reduction benefit that could be monetized, the EPA reconsidered its previous determination and found that it is not appropriate to regulate HAP emissions from coal- and oil-fired EGUs after a consideration of cost, thereby reversing the Agency’s conclusion under CAA section 112(n)(1)(A), first made in 2000 and later affirmed in 2012 and 2016. Specifically, in its reconsideration, the Agency asserted that the 2016 Supplemental Finding considering the cost of MATS was flawed based on its assessment that neither of the two approaches to considering cost in the 2016 Supplemental Finding satisfied the EPA’s obligation under CAA section 112(n)(1)(A), as that provision was interpreted by the U.S. Supreme Court in *Michigan*. Additionally, the EPA determined that, while finalizing the action would reverse the 2016 Supplemental Finding, it would not remove the Coal- and Oil-Fired EGU source category from the CAA section 112(c)(1) list, nor would it affect the existing CAA section 112(d) emissions standards regulating HAP emissions from coal- and oil-fired EGUs that were promulgated in the 2012 MATS Final Rule.<sup>17</sup> See 85 FR 31312 (May 22, 2020).

In the 2020 Final Action, the EPA also finalized the risk review required by CAA section 112(f)(2) and the first technology review required by CAA section 112(d)(6) for the Coal- and Oil-Fired EGU source category regulated under MATS.<sup>(18)</sup> The EPA determined that residual risks due to emissions of air toxics from the Coal- and Oil-Fired EGU source category are acceptable and that the current NESHAP provides an ample margin of safety to protect public health and to prevent an adverse environmental effect. In the technology review, the EPA did not identify any new developments in HAP emission controls to achieve further cost-effective emissions reductions. Based on the results of these reviews, the EPA found that no revisions to MATS were warranted. See 85 FR 31314 (May 22, 2020).

Several states, industry, public health, environmental, and civil rights groups petitioned for review of the 2020 Final Action in the D.C. Circuit. *American Academy of Pediatrics v. Regan*, No. 20-1221 and consolidated cases (D.C. Cir. filed June 19, 2020). On September 28, 2020, the D.C. Circuit granted the EPA’s unopposed motion to sever from the lead case and hold in abeyance two of the petitions for review: *Westmoreland Mining Holdings LLC v. EPA*, No. 20-1160 (D.C. Cir. filed May 22, 2020) (challenging the 2020 Final Action as well as prior EPA actions related to MATS, including a challenge to the MATS CAA section 112(d) standards on the basis that the 2020 Final

Action's reversal of the appropriate and necessary determination provided a "grounds arising after" for filing a petition outside the 60-day window for judicial review of MATS), and *Air Alliance Houston v. EPA*, No. 20-1268 (D.C. Cir. filed July 21, 2020) (challenging only the RTR portion of the 2020 Final Action).<sup>(19)</sup>

On January 20, 2021, President Biden signed Executive Order 13990, "Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis." The Executive Order, among other things, instructs the EPA to review the 2020 Final Action and consider publishing a notice of proposed rulemaking suspending, revising, or rescinding that action. In February 2021, the EPA moved the D.C. Circuit to hold *American Academy of Pediatrics* and consolidated cases in abeyance, pending the Agency's review of the 2020 Final Action as prompted in Executive Order 13990, and on February 16, 2021, the D.C. Circuit granted the Agency's motion.<sup>(20)</sup>

In the meantime, the requirements of MATS have been fully implemented, resulting in significant reductions in HAP emissions from EGUs and the risks associated with those emissions. The EPA had projected that annual EGU mercury emissions would be reduced by 75 percent with MATS implementation. In fact, EGU emission reductions have been far more substantial (down to approximately 4 tons in 2017), which represents an 86 percent reduction compared to 2010 (pre-MATS) levels. See Table 4 at 84 FR 2689 (February 7, 2019). Acid gas HAP and non-mercury metal HAP have similarly been reduced—by 96 percent and 81 percent, respectively—as compared to 2010 levels. *Id.* MATS is the only Federal requirement that guarantees this level of HAP control from EGUs.

The EPA is now proposing to revoke the 2020 reconsideration of the 2016 Supplemental Finding and to reaffirm once again that it is appropriate and necessary to regulate emissions of HAP from coal- and oil-fired EGUs. We will provide notice of the results of our review of the 2020 RTR in a separate future action.

## B. Statutory Background

Additional statutory context is useful to help identify the relevant factors that the Administrator should weigh when making the appropriate and necessary determination.

### 1. Pre-1990 History of HAP Regulation

In 1970, Congress enacted CAA section 112 to address the millions of pounds of HAP emissions that were estimated to be emitted from stationary sources in the country. At that time, the CAA defined HAP as "an air pollutant to which no ambient air quality standard is applicable and which, in the judgment of the Administrator may cause, or contribute to, an increase in mortality or an increase in serious irreversible, or incapacitating reversible, illness," but the statute left it to the EPA to identify and list pollutants that were HAP. Once a HAP was listed, the statute required the EPA to regulate sources of that identified HAP "at the level which in [the Administrator's] judgment provides an ample margin of safety to protect the public health from such hazardous air pollutants." CAA section 112(b)(1)(B) (pre-1990 amendments); Legislative History of the CAA Amendments of 1990 ("Legislative History"), at 3174-75, 3346 (Comm. Print 1993). The statute did not define the term "ample margin of safety" or provide a risk metric on which the EPA was to establish standards, and initially the EPA endeavored to account for costs and technological feasibility in every regulatory decision. In *Natural Resources Defense Council (NRDC) v. EPA*, 824 F.2d 1146 (D.C. Cir. 1987), the D.C. Circuit concluded that the CAA required that in interpreting what constitutes "safe," the EPA was prohibited from considering cost and technological feasibility. *Id.* at 1166.

The EPA subsequently issued the NESHAP for benzene in accordance with the *NRDC* holding.<sup>(21)</sup> Among other things, the Benzene NESHAP concluded that there is a rebuttable presumption that any cancer risk greater than 100-in-1 million to the most exposed individual is unacceptable, and per *NRDC*, must be addressed without consideration of cost or technological feasibility. The Benzene NESHAP further provided that, after evaluating the acceptability of cancer risks, the EPA must evaluate whether the current level of control provides an ample margin of safety for any risk greater than 1-in-1 million and, if not, the EPA will establish more stringent standards as necessary after considering cost and technological feasibility.<sup>(22)</sup>

### 2. Clean Air Act 1990 Amendments to Section 112

In 1990, Congress radically transformed section 112 of the CAA and its treatment of hazardous air pollution. The legislative history of the amendments indicates Congress' dissatisfaction with the EPA's slow pace addressing these pollutants under the 1970 CAA: "In theory, [hazardous air pollutants] were to be stringently controlled under the existing Clean Air Act section 112. However, . . . only seven of the hundreds of potentially hazardous air pollutants have been regulated by EPA since section 112 was enacted in 1970." H.R. Rep. No. 101-490, at 315 (1990); see also *id.* at 151 (noting that in 20 years, the EPA's establishment of standards for only seven HAP covered "a small fraction of the many substances associated . . . with cancer, birth defects, neurological damage, or other serious health impacts."). Congress was concerned with how few sources had been addressed during this time. *Id.* ("[The EPA's] regulations sometimes apply only to limited sources of the relevant pollutant. For example, the original benzene standard covered just one category of sources (equipment leaks). Of the 50 toxic substances emitted by industry in the greatest volume in 1987, only one—benzene—has been regulated even partially by EPA."). Congress noted that state and local regulatory efforts to act in the face of "the absence of Federal regulations" had "produced a patchwork of differing standards," and that "[m]ost states . . . limit the scope of their program by addressing a limited number of existing sources or source categories, or by addressing existing sources only on a case-by-case basis as problem sources are identified" and that "[o]ne state exempts all existing sources from review." *Id.*

In enacting the 1990 Amendments with respect to the control of hazardous air pollution, Congress noted that "[p]ollutants controlled under [section 112] tend to be less widespread than those regulated [under other sections of the CAA], but are often associated with more serious health impacts, such as cancer, neurological disorders, and reproductive dysfunctions." *Id.* at 315. In its substantial 1990 Amendments, Congress itself listed 189 HAP (CAA section 112(b)) and set forth a statutory structure that would ensure swift regulation of a significant majority of these HAP emissions from stationary sources. Specifically, after defining major and area sources and requiring the Agency to list all major sources and many area sources of the listed pollutants (CAA section 112(c)), the new CAA section 112 required the Agency to establish technology-based emission standards for listed source categories on a prompt schedule and to revisit those technology-based standards every 8 years (CAA section 112(d) (emission standards); CAA section 112(e) (schedule for standards and review)). The 1990 Amendments also obligated the EPA to evaluate the residual risk within 8 years of promulgation of technology-based standards. CAA section 112(f) (2).

In setting the standards, CAA section 112(d) requires the Agency to establish technology-based standards that achieve the "maximum degree of reduction," "including a prohibition on such emissions where achievable." CAA section 112(d)(2). Congress specified that the maximum degree of reduction must be at least as stringent as the average level of control achieved in practice by the best performing sources in the category or subcategory based on emissions data available to the Agency at the time of promulgation. This technology-based approach permitted the EPA to swiftly set standards for source categories without determining the risk or cost in each specific case, as the EPA had done prior to the 1990 Amendments. In other words, this approach to regulation quickly required that all major sources and many area sources of HAP install control technologies consistent with the top performers in each category, which had the effect of obtaining immediate reductions in the volume of HAP emissions from stationary sources. The statutory requirement that sources obtain levels of emission limitation that have actually been achieved by existing sources, instead of levels that could theoretically be achieved, inherently reflects a built-in cost consideration. <sup>(23)</sup>

Further, after determining the minimum stringency level of control, or MACT floor, CAA section 112(d)(2) requires the Agency to determine whether more stringent standards are achievable after considering the cost of achieving such standards and any non-air-quality health and environmental impacts and energy requirements of additional control. In doing so, the statute further specifies in CAA section 112(d)(2) that the EPA should consider requiring sources to apply measures that, among other things, "reduce the volume of, or eliminate emissions of, such pollutants . . ." (CAA section 112(d)(2)(A)), "enclose systems or processes to eliminate emissions" (CAA section 112(d)(2)(B)), and "collect, capture, or treat such pollutants when released . . ." (CAA section 112(d)(2)(C)). The 1990 Amendments also built in a regular review of new technologies and a one-time review of risks that remain after imposition of MACT standards. CAA section 112(d)(6) requires the EPA to evaluate every NESHAP no less often than every 8 years to determine whether additional control is necessary after taking into consideration

“developments in practices, processes, and control technologies,” without regard to risk. CAA section 112(f) requires the EPA to ensure that the risks are acceptable and that the MACT standards provide an ample margin of safety.

The statutory requirement to establish technology-based standards under CAA section 112 avoided the need for the EPA to identify hazards to public health and the environment in order to justify regulation of HAP emissions from stationary sources, reflecting Congress' judgment that such emissions are inherently dangerous. See S. Rep. No. 101-228, at 148 (“The MACT standards are based on the performance of technology, and not on the health and environmental effects of the [HAP].”). The technology review required in CAA section 112(d)(6) further mandates that the EPA continually evaluate standards to determine if additional reductions can be obtained, without consideration of the specific risk associated with the HAP emissions that would be reduced. Notably, the CAA section 112(d)(6) review of what additional reductions may be obtained based on new technology is required *even after* the Agency has conducted the CAA section 112(f)(2) review and determined that the existing standard will protect the public with an ample margin of safety.

The statutory structure and legislative history also demonstrate Congress' concern with the many ways that HAP can harm human health and Congress' goal of protecting the most exposed and vulnerable members of society. The committee report accompanying the 1990 Amendments discussed the scientific understanding regarding HAP risk at the time, including the 1989 report on benzene performed by the EPA noted above. H.R. Rep. No. 101-490, at 315. Specifically, Congress highlighted the EPA's findings as to cancer incidence, and importantly, lifetime individual risk to the most exposed individuals. *Id.* The report also notes the limitations of the EPA's assessment: “The EPA estimates evaluated the risks caused by emissions of a single toxic air pollutant from each plant. But many facilities emit numerous toxic pollutants. The agency's risk assessments did not consider the combined or synergistic effects of exposure to multiple toxics, or the effect of exposure through indirect pathways.” *Id.* Congress also noted the EPA's use of the maximum exposed individual (MEI) tool to assess risks faced by heavily exposed citizens. *Id.* The report cited particular scientific studies demonstrating that some populations are more affected than others—for example, it pointed out that “[b]ecause of their small body weight, young children and fetuses are especially vulnerable to exposure to PCB-contaminated fish. One study has found long-term learning disabilities in children who had eaten high-levels of Great Lakes fish.” *Id.*

The statutory structure confirms Congress' approach to risk and sensitive populations. As noted, the CAA section 112(f)(2) residual risk review requires the EPA to consider whether, after imposition of the CAA section 112(d)(2) MACT standard, there are remaining risks from HAP emissions that warrant more stringent standards to provide an ample margin of safety to protect public health or to prevent an adverse environmental effect. See CAA section 112(f)(2)(A). Specifically, the statute requires the EPA to promulgate standards under the risk review provision if the CAA section 112(d) standard does not “reduce lifetime excess cancer risks to the individual most exposed to emissions from a source in the category or subcategory to less than one in one million.” *Id.* Thus, even after the application of MACT standards, the statute directs the EPA to conduct a rulemaking if even *one* person has a risk, not a guarantee, of getting cancer. This demonstrates the statutory intent to protect even the most exposed member of the population from the harms attendant to exposure to HAP emissions.

If a residual risk rulemaking is required, as noted above, the statute incorporates the detailed rulemaking approach set forth in the Benzene NESHAP for determining whether HAP emissions from stationary sources pose an unacceptable risk and whether standards provide an ample margin of safety. See CAA section 112(f)(2)(B) (preserving the prior interpretation of “ample margin of safety” set forth in the Benzene NESHAP). That approach includes a rebuttable presumption that any cancer risk greater than 100-in-1 million to the most exposed person is per se unacceptable. For non-cancer chronic and acute risks, the EPA has more discretion to determine what is acceptable, but even then, the statute requires the EPA to evaluate the risks to the most exposed individual and our RfDs are developed with the goal of being protective of even sensitive members of the population. See e.g., CAA section 112(n)(1)(C) (requiring, in part, the development of “a threshold for mercury concentration in the tissue of fish which may be consumed (including consumption by sensitive populations) without adverse effects to public health”). If risks are found to be unacceptable, the EPA must impose additional control requirements to ensure that post CAA section 112(f) risks from HAP emissions are at an acceptable level, regardless of cost and technological feasibility.

After determining whether the risks are acceptable and developing standards to achieve an acceptable level of risk if necessary, the EPA must then determine whether more stringent standards are necessary to provide an ample margin of safety to protect public health, and at this stage we must take into consideration cost, technological feasibility, uncertainties, and other relevant factors. As stated in the Benzene NESHAP, “In protecting public health with an ample margin of safety under section 112, EPA strives to provide maximum feasible protection against risks to health from hazardous air pollutants by . . . protecting the greatest number of persons possible to an individual lifetime risk level no higher than approximately 1 in 1 million.” See 54 FR 38044-45 (September 14, 1989); see also *NRDC v. EPA*, 529 F.3d 1077, 1082 (D.C. Cir. 2008) (finding that “the Benzene NESHAP standard established a maximum excess risk of 100-in-one million, while adopting the one-in-one million standard as an aspirational goal.”).

The various listing and delisting provisions of CAA section 112 further demonstrate a statutory intent to reduce risk and protect the most exposed members of the population from HAP emissions. See, e.g., CAA section 112(b)(2) (requiring the EPA to add pollutants to the HAP list if the EPA determines the HAP “presents, or may present” adverse human health or adverse environmental effects); *id.* at CAA section 112(b)(3)(B) (requiring the EPA to add a pollutant to the list if a petitioner shows that a substance is known to cause or “may reasonably be anticipated to cause adverse effects to human health or adverse environmental effects”); *id.* at CAA section 112(b)(3) (authorizing the EPA to delete a substance only on a showing that “the substance may not reasonably be anticipated to cause any adverse effects to human health or adverse environmental effects.”); *id.* at CAA section 112(c)(9)(B)(i) (prohibiting the EPA from delisting a source category if even one source in the category causes a lifetime cancer risk greater than 1-in-1 million to “the individual in the population who is most exposed to emissions of such pollutants from the source.”); *id.* at CAA section 7412(c)(9)(B)(i) (prohibiting the EPA from delisting a source category unless the Agency determines that the non-cancer causing HAP emitted from the source category do not “exceed a level which is adequate to protect public health with an ample margin of safety and no adverse environmental effect will result from emissions of any source” in the category); *id.* at CAA section 112(n)(1)(C) (requiring a study to determine the level of mercury in fish tissue that can be consumed by even sensitive populations without adverse effect to public health).

The deadlines for action included in the 1990 Amendments indicate that Congress wanted HAP pollution addressed quickly. The statute requires the EPA to list all major source categories within 1 year of the 1990 Amendments and to regulate those listed categories on a strict schedule that prioritizes the source categories that are known or suspected to pose the greatest risks to the public. See CAA sections 112(c)(1), 112(e)(1) and 112(e)(2). For area sources, where the statute provides the EPA with greater discretion to determine the sources to regulate, it also directs the Agency to collect the information necessary to make the listing decision for many area source categories and requires the Agency to act on that information by a date certain.

For example, CAA section 112(k) establishes an area source program designed to identify and list at least 30 HAP that pose the greatest threat to public health in the largest number of urban areas (urban HAP) and to list for regulation area sources that account for at least 90 percent of the area source emissions of the 30 urban HAP. See CAA sections 112(k) and 112(c)(3). In addition to the urban air toxics program, CAA section 112(c)(6) directs the EPA to identify and list sufficient source categories to ensure that at least 90 percent of the aggregate emissions of seven bioaccumulative and persistent HAP, including mercury, are subject to standards pursuant to CAA sections 112(d)(2) or (d)(4). See CAA section 112(c)(6). Notably, these requirements were *in addition to* any controls on mercury and other CAA section 112(c)(6) HAP that would be imposed if the EPA determined it was appropriate and necessary to regulate EGUs under CAA section 112. This was despite the fact that it was known at the time of enactment that other categories with much lower emissions of mercury would have to be subject to MACT standards because of the exclusion of EGUs from CAA section 112(c)(6).

As the preceding discussion demonstrates, throughout CAA section 112 and its legislative history, Congress made clear its intent to quickly secure large reductions in the volume of HAP emissions from stationary sources because of its recognition of the hazards to public health and the environment inherent in exposure to such emissions. CAA section 112 and its legislative history also reveal Congress' understanding that fully characterizing the risks posed by HAP emissions was exceedingly difficult; thus, Congress purposefully replaced a regime that required an assessment of risk in the first instance with one that assumed that risk and directed swift and substantial

reductions. The statutory design and direction also repeatedly emphasize that the EPA should regulate with the most exposed and most sensitive members of the population in mind in order to achieve an acceptable level of HAP emissions with an ample margin of safety. As explained further below, this statutory context informs the EPA's judgment as to the relevant factors to weigh in the analysis of whether regulation remains appropriate after a consideration of cost.

### III. Proposed Determination Under CAA Section 112(n)(1)(A)

In this action, the EPA is proposing to revoke the 2020 Final Action and to reaffirm the appropriate and necessary determination made in 2000, and reaffirmed in 2012 and 2016. <sup>(24)</sup> We propose to find that, under either our preferred totality-of-the-circumstances framework or our alternative formal BCA framework, the information that would have been available to the Agency as of the time of the 2012 rulemaking supports a determination that it is appropriate and necessary to regulate HAP from EGUs. We also consider new information regarding the hazards to public health and the environment and the costs of compliance with MATS that has become available since the 2016 Supplemental Finding, and find that the updated information strengthens the EPA's conclusion that it is appropriate and necessary to regulate HAP from coal- and oil-fired EGUs.

At the outset, we note that CAA section 112(n)(1)(A) is silent as to whether the EPA may consider updated information when acting on a remand of the appropriate and necessary determination. CAA section 112(n)(1)(A) directs the EPA to conduct the Utility Study within 3 years, and requires the EPA to regulate EGUs if the Administrator makes a finding that it is appropriate and necessary to do so "after" considering the results of the Utility Study. Consistent with the EPA's interpretation in 2005, 2012, 2016, and 2020, we do not read this language to *require* the EPA to consider the most-up-to-date information where the Agency is compelled to revisit the determination, but nor do we interpret the provision to *preclude* consideration of new information where reasonable. See 70 FR 16002 (March 29, 2005); 77 FR 9310 (February 16, 2012); 81 FR 24432 (April 25, 2016); 85 FR 31306 (May 22, 2020). As such, the Agency has applied its discretion in determining when to consider new information under this provision based on the circumstances. For example, when the EPA was revisiting the determination in 2012, we noted that "[b]ecause several years had passed since the 2000 finding, the EPA performed additional technical analyses for the proposed rule, even though those analyses were not required." 77 FR 9310 (February 16, 2012). <sup>(25)</sup> Similarly, we think that it is reasonable to consider new information in the context of this proposal, given that almost a decade has passed since we last considered updated information. In this proposed reconsideration of the determination per the President's Executive Order, both the growing scientific understanding of public health risks associated with HAP emissions and a clearer picture of the cost of control technologies and the make-up of power sector generation over the last decade may inform the question of whether it is appropriate to regulate, and, in particular, help address the inquiry that the Supreme Court directed us to undertake in *Michigan*. We believe the evolving scientific information with regard to benefits and the advantage of hindsight with regard to costs warrant considering currently available information in making this determination. To the extent that our determination should flow from information that would have been available at the "initial decision to regulate," *Michigan*, 576 U.S. at 754, we propose conclusions here based on analyses limited to this earlier record. But we also believe it is reasonable to consider new data, and propose to find that the new information regarding both public health risks and costs bolsters the finding and supports a determination that it is appropriate and necessary to regulate EGUs for HAP.

In section III.A of this preamble, we first describe the advantages of regulation—the reduction in emissions of HAP and attendant reduction of risks to human health and the environment, including the distribution of these health benefits. We carefully document the numerous risks to public health and the environment posed by HAP emissions from EGUs. This includes information previously recognized and documented in the statutorily mandated CAA section 112(n)(1) studies, the 2000 Determination, the 2012 MATS Final Rule, and the 2016 Supplemental Finding about the nature and extent of health and environmental impacts from HAP that are emitted by EGUs, as well as additional risk analyses supported by new scientific studies. Specifically, new risk screening analyses on the connection between mercury and heart disease as well as IQ loss in children across the U.S. further supports the conclusion that HAP emissions from EGUs pose hazards to public health and the environment warranting regulating under CAA section 112. The EPA also discusses the challenges associated with fully quantifying and

monetizing the human health and environmental effects associated with HAP emissions. Finally, we note that in addition to reducing the identified risks posed by HAP emissions from EGUs, regulation of such HAP emissions results in significant health and environmental co-benefits.

We then turn in preamble section III.B. to the disadvantages of regulation—the costs associated with reducing EGU HAP emissions and other potential impacts to the sector and the economy associated with MATS. With the benefit of hindsight, we first consider whether MATS actually cost what we projected in the 2011 RIA and conclude that the projection in the 2011 RIA was almost certainly a significant overestimate of the actual costs. We then evaluate the costs estimated in the 2011 RIA against several metrics relevant to the impacts those costs have on the EGU sector and American electricity consumers ( e.g., historical annual revenues, annual capital and production expenditures, impacts on retail electricity prices, and impacts on resource adequacy and reliability). These analyses, based on data available in 2012 and based on updated data, all show that the costs of MATS were within the bounds of typical historical fluctuations and that the industry would be able to comply with MATS and continue to provide a reliable source of electricity without price increases that were outside the range of historical variability.

In section III.C of this preamble, we explain why the methodology used in our 2020 Finding was ill-suited to determining whether EGU HAP regulation is appropriate and necessary because it gave virtually no weight to the volume of HAP that would be reduced, and the vast majority of the benefits of reducing EGU HAP, including the reduction of risk to sensitive populations, based on the Agency's inability to quantify or monetize post-control benefits of HAP regulations.

In preamble section III.D, we explain our preferred totality-of-the-circumstances methodology that we propose to use to make the appropriate determination, and our application of that methodology. This approach looks to the statute, and particularly CAA section 112(n)(1)(A) and the other provisions in CAA section 112(n)(1), to help identify the relevant factors to weigh and what weight to afford those factors. Under that methodology we weigh the significant health and environmental advantages of reducing EGU HAP, and in particular the benefits to the most exposed and sensitive individuals, against the disadvantages of expending money to achieve those benefits— i.e., the effects on the electric generating industry and its ability to provide reliable and affordable electricity. We ultimately propose to conclude that the advantages outweigh the disadvantages whether we look at the record from 2012 or at our new record, which includes an expanded understanding of the health risks associated with HAP emissions and finds that the costs projected in the 2011 RIA were almost certainly significantly overestimated. We further consider that, if we also account for the non-HAP benefits in our preferred totality-of-the-circumstances approach, such as the benefits (including reduced mortality) of coincidental reductions in PM and ozone that flow from the application of controls on HAP, the balance weighs even more heavily in favor of regulating HAP emissions from coal- and oil-fired EGUs.

Finally, in section III.E, we consider an alternative methodology to make the appropriate determination, using a formal BCA of MATS that was conducted consistent with economic principles. This methodology is not our preferred way to consider advantages and disadvantages for the CAA section 112(n)(1)(A) determination, because the EPA's inability to generate a monetized estimate of the full benefits of HAP reductions can lead to an underestimate of the monetary value of the net benefits of regulation. To the extent that a formal BCA is appropriate for making the CAA section 112(n)(1)(A) determination, however, that approach demonstrates that the monetized benefits of MATS outweigh the monetized costs by a considerable margin, whether we look at the 2012 record or our updated record. We therefore propose that it is appropriate to regulate EGUs for HAP applying a BCA approach as well.

In sum, the EPA proposes to conclude that it is appropriate and necessary to regulate HAP emissions from coal- and oil-fired EGUs, whether we are applying the preferred totality-of-the-circumstances methodology or the alternative formal benefit-cost approach, and whether we are considering only the administrative record as of the original EPA response on remand to *Michigan* in 2016 or based on new information made available since that time. The information and data amassed by the EPA over the decades of administrative analysis and rulemaking devoted to this topic overwhelmingly support the conclusion that the advantages of regulating HAP emissions from coal- and oil-fired EGUs outweigh the costs. The EPA requests comment on this proposed finding and on the supporting

information presented in this proposal, including information related to the risks associated with HAP emissions from U.S. EGUs and the actual costs incurred by the power sector due to MATS, as well as on the preferred and alternative methodologies for reaching the proposed conclusion.

## A. Public Health Hazards Associated With Emissions From EGUs

### 1. Overview

The administrative record for the MATS rule detailed several hazards to public health and the environment from HAP emitted by EGUs that remained after imposition of the ARP and other CAA requirements. See 80 FR 75028-29 (December 1, 2015). See also 65 FR 79825-31 (December 20, 2000); 76 FR 24976-25020 (May 3, 2011); 77 FR 9304-66 (February 16, 2012). The EPA considered all of this information again in the 2016 Supplemental Finding, noting that this sector represented a large fraction of U.S. emissions of mercury, non-mercury metal HAP, and acid gases. Specifically, the EPA found that even after imposition of the other requirements of the CAA, but absent MATS, EGUs remained the largest domestic source of mercury, HF, HCl, and selenium and among the largest domestic contributors of arsenic, chromium, cobalt, nickel, hydrogen cyanide, beryllium, and cadmium, and that a significant majority of EGU facilities emitted above the major source thresholds for HAP emissions.

Further, the EPA noted that the totality of risks that accrue from these emissions were significant. These hazards include potential neurodevelopmental impairment, increased cancer risks, contribution to chronic and acute health disorders, as well as adverse impacts on the environment. Specifically, the EPA pointed to results from its revised nationwide Mercury Risk Assessment (contained in the 2011 Final Mercury TSD) <sup>(26)</sup> as well as an inhalation risk assessment (2011 Non-Hg HAP Assessment) for non-mercury HAP ( *i.e.*, arsenic, nickel, chromium, selenium, cadmium, HCl, HF, hydrogen cyanide, formaldehyde, benzene, acetaldehyde, manganese, and lead). The EPA estimated lifetime cancer risks for inhabitants near some coal- and oil-fired EGUs to exceed 1-in-1 million <sup>(27)</sup> and noted that this case-study-based estimate likely underestimated the true maximum risks for the EGU source category. See 77 FR 9319 (February 16, 2012). The EPA also found that mercury emissions pose a hazard to wildlife, adversely affecting fish-eating birds and mammals, and that the large volume of acid gas HAP associated with EGUs also pose a hazard to the environment. <sup>(28)</sup> These technical analyses were all challenged in the *White Stallion* case, and the D.C. Circuit found that the EPA's risk finding as to mercury alone—that is, before reaching any other risk finding—established a significant public health concern. The court stated that “EPA's ‘appropriate and necessary’ determination in 2000, and its reaffirmation of that determination in 2012, are amply supported by EPA's finding regarding the health effects of mercury exposure.” *White Stallion Energy Center v. EPA*, 748 F.3d 1222, 1245 (D.C. Cir. 2014). Additional scientific evidence about the human health hazards associated with EGU HAP emissions that has been collected since the 2016 Supplemental Finding and is discussed in this section has extended our confidence that these emissions pose an unacceptable risk to the American public and in particular, to vulnerable, exposed populations.

This section of the preamble starts by briefly reviewing the long-standing and extensive body of evidence, including new scientific information made available since the 2016 Supplemental Finding, which demonstrates that HAP emissions from oil- and coal-fired EGUs present hazards to public health and the environment warranting regulation under CAA section 112 (section III.A.2). This is followed by an expanded discussion of the health risks associated with domestic EGU mercury emissions based on additional evidence regarding cardiovascular effects that has become available since the 2016 Supplemental Finding (section III.A.3). In section III.A.4, the EPA describes the reasons why it is extremely difficult to estimate the full health and environmental impacts associated with exposure to HAP. We note the longstanding challenges associated with quantifying and monetizing these effects, which may be permanent and life-threatening and are often distributed unevenly ( *i.e.*, concentrated among highly exposed individuals). Next, the section provides an expanded discussion of some identified environmental justice (EJ) issues associated with these emissions (section III.A.5). Section III.A.6 identifies health effects associated with other, non-HAP emissions from EGUs such as SO<sub>2</sub>, direct PM<sub>2.5</sub> and other PM<sub>2.5</sub> and ozone precursors. Because these pollutants are co-emitted with HAP, the controls necessary to reduce HAP emissions from EGUs often reduce these pollutants as well. After assessing all the evidence, the EPA concludes again (section III.A.7) that regulation of HAP emissions from EGUs under CAA section 112 greatly improves public health for Americans by reducing the risks of premature mortality from heart attacks, cancer, and neurodevelopmental

delays in children, and by helping to restore economically vital ecosystems used for recreational and commercial purposes. Further, we conclude that these public health improvements will be particularly pronounced for certain segments of the American population that are especially vulnerable ( e.g., subsistence fishers <sup>(29)</sup> and their children) to impacts from EGU HAP emissions. In addition, the concomitant reductions in co-emitted pollutants will also provide substantial public health and environmental benefits.

## 2. Overview of Health Effects Associated With Mercury and Non-Mercury HAP

In calling for the Agency to consider the regulation of HAP from EGUs, the CAA stipulated that the EPA complete three studies (all of which were extensively peer-reviewed) exploring various aspects of risk posed to human health and the environment by HAP released from EGUs. The first of these studies, the Utility Study, published in 1998, focused on the hazards to public health specifically associated with EGU-sourced HAP including, but not limited to, mercury. See CAA section 112(n)(1)(A). A second study, the Mercury Study, released in 1997, while focusing exclusively on mercury, was broader in scope including not only human health, but also environmental impacts and specifically addressed the potential for mercury released from multiple emissions sources (in addition to EGUs) to affect human health and the environment. See CAA section 112(n)(1)(B). The third study, required under CAA section 112(n)(1)(C), the NIEHS Study, submitted to Congress in 1995, considered the threshold level of mercury exposure below which adverse human health effects were not expected to occur. An additional fourth study, the NAS Study, directed by Congress in 1999 and completed in 2000, focused on determining whether a threshold for mercury health effects could be identified for sensitive populations and, as such, presented a rigorous peer review of the EPA's RfD for methylmercury. The aggregate results of these peer-reviewed studies commissioned by Congress as part of CAA section 112(n)(1) supported the determination that HAP emissions from EGUs represented a hazard to public health and the environment that would not be addressed through imposition of the other requirements of the CAA. In the 2 decades that followed, the EPA has continued to conduct additional research and risk assessments and has surveyed the latest science related to the risk posed to human health and the environment by HAP released from EGUs.

### a. Review of Health Effects and Previous Risk Analyses for Methylmercury

Mercury is a persistent and bioaccumulative toxic metal that, once released from power plants into the ambient air, can be readily transported and deposited to soil and aquatic environments where it is transformed by microbial action into methylmercury. See Mercury Study; 76 FR 24976 (May 3, 2011) (2011 NESHAP Proposal); 80 FR 75029 (December 1, 2015) (2015 Proposal). Methylmercury bioaccumulates in the aquatic food web eventually resulting in highly concentrated levels of methylmercury within the larger and longer-living fish, which can then be consumed by humans. <sup>(30)</sup> As documented in both the NAS Study and the Mercury Study, fish and seafood consumption is the primary route of human exposure to methylmercury, with populations engaged in subsistence-levels of consumption being of particular concern. <sup>(31)</sup> The NAS Study reviewed the effects of methylmercury on human health, concluding that it is highly toxic to multiple human and animal organ systems. Of particular concern is chronic prenatal exposure via maternal consumption of foods containing methylmercury. Elevated exposure has been associated with developmental neurotoxicity and manifests as poor performance on neurobehavioral tests, particularly on tests of attention, fine motor function, language, and visual-spatial ability. Evidence also suggests potential for adverse effects on the cardiovascular system, adult nervous system, and immune system, as well as potential for causing cancer. <sup>(32)</sup> Below we review the broad range of public health hazards associated with methylmercury exposure.

*Neurodevelopmental Effects of Exposure to Methylmercury.* Methylmercury is a powerful neurotoxin. Because the impacts of the neurodevelopmental effects of methylmercury are greatest during periods of rapid brain development, developing fetuses and young children are particularly vulnerable. Children born to populations with high fish consumption ( e.g., people consuming fish as a dietary staple) or impaired nutritional status ( e.g., people with iron or vitamin C deficiencies) are especially vulnerable to adverse neurodevelopmental outcomes. These dietary and nutritional vulnerabilities are often particularly pronounced in underserved communities with minority populations and low-income populations that have historically faced economic and environmental injustice and are overburdened by cumulative levels of pollution. <sup>(33)</sup>

Infants in the womb can be exposed to methylmercury when their mothers eat fish and shellfish that contain methylmercury. This exposure can adversely affect unborn infants' growing brains and nervous systems. Children exposed to methylmercury while they are in the womb can have impacts to their cognitive thinking, memory, attention, language, fine motor skills, and visual spatial skills. Based on scientific evidence reflecting concern about a range of neurodevelopmental effects seen in children exposed *in utero* to methylmercury, the EPA defined an RfD of 0.0001 mg/kg-day for methylmercury. <sup>(34)</sup> An RfD is defined as an estimate (with uncertainty spanning perhaps an order of magnitude) of a daily exposure to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime (EPA, 2002). <sup>(35)</sup>

Prenatal exposure to methylmercury from maternal consumption of fish has been associated with several adverse neurodevelopmental outcomes in various fish consuming populations. Although data are limited, the EPA has focused on several subpopulations likely to be at higher risk from methylmercury exposure associated with EGU HAP due to fish consumption. As part of the 2011 Final Mercury TSD, the EPA completed a national-scale risk assessment focused on mercury emissions from domestic EGUs. Specifically, we examined risk associated with mercury released from U.S. EGUs that deposits to watersheds within the continental U.S., bioaccumulates in fish as methylmercury, and is consumed when fish are eaten by female subsistence fishers of child-bearing age and other freshwater self-caught fish consumers. There is increased risk for *in utero* exposure and adverse outcomes in children born to female subsistence fishers with elevated exposure to methylmercury. The risk assessment modeled scenarios representing high-end self-caught fish consumers active at inland freshwater lakes and streams. The analysis estimated that 29 percent of the watersheds studied would lead to female subsistence fishers having exposures which exceeded the methylmercury RfD, based on *in utero* effects, due in whole or in part to the contribution of domestic EGU emissions of mercury. This included up to 10 percent of modeled watersheds where deposition from U.S. EGUs alone leads to potential exposures that exceed the RfD. <sup>(36)</sup>

In addition to the 2011 Final Mercury TSD focusing on subsistence fishers referenced above, the EPA also completed a RIA in 2011 including the characterization of benefits associated with the prospective reduction of U.S. EGU mercury emissions under MATS. <sup>(37)</sup> However, due to limitations on the available data with regard to the extent of subsistence fishing activity in the U.S., which prevented the enumeration of subsistence fisher populations, the EPA was unable to develop a quantitative estimate of the reduction in population-level risk or associated dollar benefits for children of female subsistence fishers. Instead, in the 2011 MATS RIA, the EPA focused on a different population of self-caught fish consumers that could be enumerated. Specifically, we quantitatively estimated the amount and value of IQ loss associated with prenatal methylmercury exposure among the children of recreational anglers consuming self-caught fish from inland freshwater lakes, streams and rivers (unlike subsistence fishers, available data allow the characterization of recreational fishing activity across the U.S. including enumeration of these populations). Although the EPA acknowledged uncertainty about the size of the affected population and acknowledged that it could be underestimated, these unborn children associated with recreational anglers represented precisely the type of sensitive population most at risk from mercury exposure that CAA section 112 is designed to protect. The results generated in the 2011 RIA for recreational anglers suggested that by reducing methylmercury exposure, MATS was estimated to yield an additional 511 IQ points among the affected population of children, which would increase their future lifetime earnings. The EPA noted at the time that the analysis likely underestimated potential benefits for children of recreational anglers since, due to data limitations, it did not cover consumption of recreationally caught seafood from estuaries, coastal waters, and the deep ocean which was expected to contribute significantly to overall exposure. Nevertheless, this single endpoint alone, evaluated solely for the recreational angler, provides evidence of potentially significant health harm from methylmercury exposure.

In 2011 we noted that other, more difficult to quantify endpoints may also contribute to the overall burden across a broader range of subgroups. The metrics studied in addition to IQ include those measured by performance on neurobehavioral tests, particularly on tests of attention, fine motor-function, language, and visual spatial ability (USEPA, 2001; Agency for Toxic Substances and Disease Registry (ATSDR), 1999). <sup>(38)</sup> Such adverse neurodevelopmental effects are well documented in cohorts of subsistence fisher populations ( *i.e.*, Faroe Islands and the Nunavik region of Arctic Canada).

At this time, the EPA is conducting an updated methylmercury IRIS assessment and recently released preliminary assessment materials, an IRIS Assessment Plan (IAP) and Systematic Review Protocol for methylmercury. <sup>(39)</sup> The update to the methylmercury IRIS assessment will focus on updating the quantitative aspects of neurodevelopmental outcomes associated with methylmercury exposure. As noted in these early assessment materials, new studies are available, since 2001, assessing the effects of methylmercury exposure on cognitive function, motor function, behavioral, structural, and electrophysiological outcomes at various ages following prenatal or postnatal exposure to methylmercury (USEPA, 2001; NAS Study; 84 FR 13286 (April 4, 2019); <sup>(40)</sup> 85 FR 32037 (May 8, 2020)). <sup>(41)</sup>

*Cardiovascular Impacts of Exposure to Methylmercury.* The NAS Study indicated that there was evidence that exposure to methylmercury in humans and animals can have adverse effects on both the developing and adult cardiovascular system. Infant exposure in the womb to methylmercury has been associated with altered blood-pressure and heart-rate variability in children. In adults, dietary exposure to methylmercury has been linked to a higher risk of acute myocardial infarction (MI), coronary heart disease, or cardiovascular heart disease. To date, the EPA has not attempted to utilize a quantitative dose-response assessment for cardiovascular effects associated with methylmercury exposures because of a lack of consensus among scientists on the dose-response functions for these effects and inconsistency among available studies as to the association between methylmercury exposure and various cardiovascular system effects.

However, additional studies have become available that have increased the EPA's confidence in characterizing the dose-response relationship between methylmercury and adverse cardiovascular outcomes. These new studies were leveraged to inform new quantitative screening analyses (described in section III.A.3, below) to estimate one cardiovascular endpoint—incidence of MI mortality—that may potentially be linked to U.S. EGU mercury emissions as well as the number of U.S. EGU impacted watersheds. In addition to a new meta-analysis (Hu *et al.*, 2021) <sup>(42)</sup> on the association of methylmercury generally with cardiovascular disease (CVD), stroke, and ischemic heart disease (IHD), there is a limited body of existing literature that has examined associations between mercury and various cardiovascular outcomes. These include acute MI, hypertension, atherosclerosis, and heart rate variability (Roman *et al.*, 2011). <sup>(43)</sup>

*Immunotoxic Effects of Exposure to Methylmercury.* Although exposure to some forms of mercury can result in a decrease in immune activity or an autoimmune response (ATSDR, 1999), evidence for immunotoxic effects of methylmercury is limited (NAS Study).

*Other Mercury-Related Human Toxicity Data Including Potential Carcinogenicity.* The Mercury Study noted that methylmercury is not a potent mutagen but is capable of causing chromosomal damage in a number of experimental systems. The NAS Study indicated that the evidence that human exposure to methylmercury causes genetic damage is inconclusive; it noted that some earlier studies showing chromosomal damage in lymphocytes may not have controlled sufficiently for potential confounders. One study of adults living in the Tapajos River region in Brazil (Amorim *et al.*, 2000) <sup>(44)</sup> reported a relationship between methylmercury concentration in hair and DNA damage in lymphocytes, as well as effects on chromosomes. Long-term methylmercury exposures in this population were believed to occur through consumption of fish, suggesting that genotoxic effects (largely chromosomal aberrations) may result from dietary, chronic methylmercury exposures similar to and above those seen in the populations studied in the Faroe Islands and Republic of Seychelles. Since 2000, more recent studies have evaluated methylmercury genotoxicity *in vitro* in human and animal cell lines and *in vivo* in rats.

Based on limited human and animal data, methylmercury is classified as a “possible human carcinogen” by the International Agency for Research on Cancer (IARC, 1993) <sup>(45)</sup> and in IRIS (USEPA, 2001). However, a quantitative estimate of the carcinogenic risk of methylmercury has not been assessed under the IRIS program at this time. Multiple human epidemiological studies have found no significant association between methylmercury exposure and overall cancer incidence, although a few studies have shown an association between methylmercury exposure and specific types of cancer incidence ( e.g., acute leukemia and liver cancer) (NAS Study).

Some evidence of reproductive and renal toxicity in humans from methylmercury exposure exists. However, overall, human data regarding reproductive, renal, and hematological toxicity from methylmercury are very limited and are based on studies of the two high-dose poisoning episodes in Iraq and Japan or animal data, rather than

epidemiological studies of chronic exposures at the levels of interest in this analysis.

#### b. Review of Health Effects for Non-Mercury HAP

As noted earlier, EGUs are the largest source of HCl, HF, and selenium emissions, and are a major source of metallic HAP emissions including arsenic, chromium, nickel, cobalt, and others. Exposure to these HAP, depending on exposure duration and levels of exposures, is associated with a variety of adverse health effects. These adverse health effects may include chronic health disorders ( e.g., irritation of the lung, skin, and mucus membranes; decreased pulmonary function, pneumonia, or lung damage; detrimental effects on the central nervous system; damage to the kidneys; and alimentary effects such as nausea and vomiting).

As of 2021, three of the key metal HAP emitted by EGUs (arsenic, chromium, and nickel) have been classified as human carcinogens, while three others (cadmium, selenium, and lead) are classified as probable human carcinogens. Overall (metal and non-metal), the EPA has classified four of the HAP emitted by EGUs as human carcinogens and five as probable human carcinogens. See 76 FR 25003-25005 (May 3, 2011) for a fuller discussion of the health effects associated with these pollutants.

As summarized in the *Supplement to the Non-Hg Case Study Chronic Inhalation Risk Assessment In Support of the Appropriate and Necessary Finding for Coal- and Oil-Fired Electric Generating Units* (2011 Non-Hg HAP Assessment), <sup>(46)</sup> the EPA previously completed a refined chronic inhalation risk assessment for 16 EGU case studies in order to assess potential public health risk associated with non-mercury HAP. The 16 case studies included one unit that used oil and 15 that used coal. As noted in the 2015 Proposal, this set of case studies was designed to include those facilities with potentially elevated cancer and non-cancer risk based on an initial risk screening of prospective EGU units completed utilizing the Human Exposure Model paired with HAP emissions data obtained from the 2005 National Emissions Inventory. For each of the 16 case study facilities, we conducted refined dispersion modeling with the EPA's AERMOD (American Meteorological Society/Environmental Protection Agency Regulatory Model) system to calculate annual ambient concentrations ( see 2011 Non-Hg HAP Assessment). Average annual concentrations were calculated at census block centroids. We calculated the MIR for each facility as the cancer risk associated with a continuous lifetime (24 hours per day, 7 days per week, and 52 weeks per year for a 70-year period) exposure to the maximum concentration at the centroid of an inhabited census block, based on application of the unit risk estimate from the EPA's IRIS program. Based on estimated actual emissions, the highest estimated individual lifetime cancer risk from any of the 16 case study facilities was 20-in-1 million, driven by nickel emissions from the one case study facility with oil-fired EGUs. Of the facilities with coal-fired EGUs, five facilities had MIR greater than 1-in-1 million (the highest was 5-in-1 million), with the risk from four due to emissions of chromium VI and the risk from one due to emissions of nickel. There were also two facilities with coal-fired EGUs that had MIR equal to 1-in-1 million. Based on this analysis, the EPA concludes that cancer risks associated with these HAP emissions supports a finding that it is appropriate to regulate HAP emissions from EGUs.

#### c. Review of Other Adverse Environmental Effects Associated With EGU HAP Emissions

*Ecological Effects of Methylmercury.* Along with the human health hazards associated with methylmercury, it is well-established that birds and mammals are also exposed to methylmercury through fish consumption (Mercury Study). At higher levels of exposure, the harmful effects of methylmercury include slower growth and development, reduced reproduction, and premature mortality. The effects of methylmercury on wildlife are variable across species but have been observed in the environment for numerous avian species and mammals including polar bears, river otters, and panthers. These adverse effects can propagate into impacts on human welfare to the extent they influence economies that depend on robust ecosystems ( e.g., tourism).

*Ecological Effects of Acid Gas HAP.* Even after the ARP was largely implemented in 2005, EGU sources comprised 82 percent of all anthropogenic HCl (a useful surrogate for all acid gas HAP) emissions in the U.S. When HCl dissolves in water, hydrochloric acid is formed. When hydrochloric acid is deposited by rainfall into terrestrial and aquatic ecosystems, it results in acidification of those systems. The MATS rule was expected to result in an 88 percent reduction in HCl emissions. As part of a recent Integrated Science Assessment (EPA, 2020), <sup>(47)</sup> the EPA concluded that the body of evidence is sufficient to infer a causal relationship between acidifying deposition and

adverse changes in freshwater biota. Affected biota from acidification of freshwater include plankton, invertebrates, fish, and other organisms. Adverse effects can include physiological impairment, as well as alteration of species richness, community composition, and biodiversity in freshwater ecosystems. This evidence is consistent and coherent across multiple species. More species are lost with greater acidification.

### 3. Post-2016 Screening-Level Risk Assessments of Methylmercury Impacts

This section of the preamble describes three screening-level risk assessments completed since the 2016 Supplemental Finding that further strengthen the conclusion that U.S. EGU-sourced mercury represents a hazard to public health. These “screening-level” assessments are designed as broad bounding exercises intended to illustrate the potential scope and public health importance of methylmercury risks associated with U.S. EGU emissions. In some cases, they incorporate newer peer-reviewed literature that was not available to the Agency previously. Remaining uncertainties, however, prohibit the EPA from generating a more precise estimate at this time. Two of the three risk assessments focus on the potential for methylmercury exposure to increase the risk of MI-related mortality in adults and for that reason, section III.A.3.a begins by describing the methodology used in the analyses, including discussion of the concentration response (CR) function <sup>(48)</sup> for MI-related mortality and the incorporation of confidence cutpoints designed to address uncertainty. Then, the EPA describes an extension of the original watershed-level subsistence fisher methylmercury risk assessment to evaluate the potential for elevated MI-mortality risk among subsistence fishers (section III.A.3.b). In addition, a separate risk assessment is presented for elevated MI mortality among all adults utilizing a bounding approach that explores potential risks associated with exposure of the general U.S. population to methylmercury (sourced from U.S. EGUs) through fish consumption (section III.A.3.c). Finally, focusing on neurodevelopmental outcomes, another bounding analysis is presented that focuses on the risk of IQ points loss in children exposed *in utero* through maternal fish consumption by the population of general U.S. fish consumers (section III.A.3.d). Each of these analyses quantify potential impacts on incidence of adverse health effects. Section III.A.4 provides illustrative examples of how these incidence estimates translate to monetized benefits.

#### a. Methodology for Estimating MI-Mortality

This section describes the methodology used in the new screening-level risk assessments related to mortality, including the EPA's application of a CR function characterizing the relationship between increased MI-mortality and methylmercury exposure. As discussed further in the 2021 Risk TSD, <sup>(49)</sup> which is contained in the docket for this action, the approach draws on recommendations provided by an expert panel convened by the EPA in 2010 to evaluate the cardiovascular effects associated with methylmercury exposure (the findings of the expert panel were summarized as a peer-reviewed paper, Roman *et al.*, 2011). The panel “found the body of evidence exploring the link between [methylmercury] and acute myocardial infarction (MI) to be sufficiently strong to support its inclusion in future benefits analyses, based both on direct epidemiological evidence of [a methylmercury]-MI link and on [methylmercury's] association with intermediary impacts that contribute to MI risk.” Given the likely mechanism of action associated with MI, the panel further recommended that either hair-mercury or toenail-mercury be used as an exposure metric because both reflect a longer-term pattern of exposure. Regarding the shape of the CR function, the panel noted that the EURAMIC study (Guallar *et al.*, 2002) <sup>(50)</sup> had identified a log-linear model form with log-of exposure providing the best fit using toenail mercury as the biomarker of exposure. The panel also discussed the issue of potential effect modification by cardioprotective compounds including polyunsaturated fatty acids (PUFA). <sup>(51)</sup> Kuopio Ischaemic Heart Disease Risk Factor Study (KIHD) and European Multicenter Case-Control Study on Antioxidants, Myocardial Infarction, and Cancer of the Breast Study (EURAMIC) datasets “provide the strongest and most useful data sets for quantifying methylmercury-related incidence of MI.” However, the panel did note the disconnect between typical levels of exposure to methylmercury in the U.S. population and the relatively higher levels of exposure reflected in the two recommended epidemiology studies (KIHD and EURAMIC). Therefore, the panel suggested that consideration be given to restricting modeling MI mortality to those with higher concentrations reflecting the levels of exposure found in the two key epidemiology studies (corresponding to roughly 75th to 95th percentile hair-mercury levels for U.S. women of child-bearing age, as characterized in National Health and Nutrition Examination Survey (NHANES) data and referenced by the panel).

In the intervening period since the release of the expert panel's findings in 2011 (Roman *et al.*, 2011), the EPA has continued to review literature characterizing the relationship between methylmercury exposure and cardiovascular effects. While the EPA has not yet conducted a systematic review, two recent studies are of particular interest for quantifying the potential relationship between U.S. EGU mercury emissions and acute MI that informed a modeling approach. Giang and Selin (2016) <sup>(52)</sup> presented an approach for modeling MI mortality reflecting a number of the recommendations presented in Roman *et al.*, 2011 including the use of the KIHD and EURAMIC studies as the basis for a CR function including both the log-linear functional form and the effect estimate derived from the KIHD study results. A second study, Hu *et al.* 2021, <sup>(53)</sup> presented a meta-analysis looking at the relationship between methylmercury exposure and mortality. That paper utilized eight studies each determined to be of good quality and reflecting at a minimum, adjustments for age, sex, and n-3 PUFA in specifying dose-response relationships. Historically, studies which account for n-3 PUFA have assumed a linear relationship between PUFAs and risk of MI (Roman *et al.*, 2011). However, the association between PUFA intake and cardiovascular risk may not be linear (Mozaffarian and Rimm, 2006). <sup>(54)</sup> The potential for confounding and effect modification by PUFA and selenium makes it difficult to interpret the relationship between methylmercury and MI, particularly at lower doses where there is potential for masking of methylmercury toxicity. The results of the meta-analysis by Hu *et al.*, 2021 illustrated this phenomenon with their J-shaped functions for both IHD and CVD, both of which showed an initial region of negative slope (diminishing net risk with methylmercury exposure) before reaching an inflection point (between 1 and 2 microgram per gram ( $\mu\text{g/g}$ ) hair-mercury depending on the endpoint) where the function turns positive (increasing risk).

For the EPA's new screening-level assessment, we have considered the recommendations presented in Roman *et al.*, 2011, as well as the J-shaped functions presented in Hu *et al.*, 2021, and their implications for considering overall confidence in specifying the relationship between cardiovascular-related mortality and methylmercury exposure. In particular, the EPA has higher confidence in the log-linear relationship at levels of hair-mercury exposure above the selected confidence cutpoints. In specifying these confidence cutpoints (for modeling MI mortality) we have looked to recommendations presented in Roman *et al.*, 2011, specifically that we consider modeling risk for levels of exposure reflected in the EURAMIC and KIHD studies (with these equating to roughly 0.66 and 1.9  $\mu\text{g/g}$  hair-mercury, respectively, or approximately the 75th-95th percentile of hair-mercury levels seen in women of childbearing age in available 1999-2000 NHANES survey data <sup>(55)</sup>). Further, we note that these confidence cutpoints roughly match the inflection point for IHD and CVD seen in the J-shaped plot presented in Hu *et al.*, 2021, which further supports their use in defining regions of methylmercury exposure above which we have increased confidence in modeling MI mortality. However, as noted earlier, we are not concluding here that there is an absence of risk below these cutpoints, as such conclusions would require a weight of the evidence analysis and subsequent independent peer review. Rather, we are less confident in our ability to specify the nature of the CR function in those lower exposure regions due to possible effect modification and/or confounding by PUFA and/or selenium. Therefore, in applying the CR function in modeling MI mortality, we included a set of three functions-two including the cutpoints described above and a third no-cutpoint version of the function reflecting the assumption that risk extends across the entire range of methylmercury exposure. In terms of the other elements of the CR function (shape and effect estimate), we have also followed the advice presented in Roman *et al.*, 2011, as further illustrated through the analysis published by Giang and Selin 2016, and utilized a log-linear form and an effect estimate of 0.10 for MI mortality obtained from the KIHD study ( see 2021 Risk TSD). As with the other risk estimates presented for methylmercury, these estimates reflect the baseline for U.S. EGUs prior to implementation of MATS ( *i.e.*, 29 tons).

#### b. Increased MI-Mortality Risk in Subsistence Fishers Exposed to Methylmercury

This screening-level analysis of MI-mortality risk is an extension of the female subsistence-fisher-based at-risk watershed analysis originally completed as part of the 2011 risk assessment supporting the appropriate and necessary determination (USEPA, 2011) and documented in the 2011 Final Mercury TSD. In that original analysis, a series of female subsistence fisher risk scenarios was evaluated for a subset of 3,141 watersheds within the continental U.S. for which there were sampled methylmercury fish tissue data (that fish tissue data allowing a higher-confidence empirically-based assessment of methylmercury risk to be generated for those watersheds). For each watershed, we used the fish tissue methylmercury data to characterize total mercury-related risk and then we

estimated the portion of that total risk attributable to U.S. EGUs (based on the fraction of total mercury deposition to those watersheds associated with U.S. EGU emissions as supported by the Mercury Maps approach, USEPA, 2011).<sup>(56)</sup>

We have now extended the at-risk watershed analysis completed in 2011 for the subsistence fisher scenarios to include an assessment of the potential for increased MI mortality risk.<sup>(57)</sup> Specifically, we have utilized the U.S. EGU-attributable methylmercury exposure estimates ( $\mu\text{g}/\text{kg}\text{-day}$  methylmercury intake) generated for the subsistence fisher scenario in each watershed to generate equivalent hair-mercury exposure estimates for that subsistence fisher scenario in each watershed ( see 2021 Risk TSD for additional detail on the conversion of daily methylmercury intake rates into hair-mercury levels). We then compare those hair-mercury levels to the confidence cutpoints developed for the MI mortality screening-level risk assessment described above in section III.A.3.a. If the hair-mercury level for a particular watershed is above either the EURAMIC or KIHD confidence cutpoint ( *i.e.*, above 0.66 and 1.9  $\mu\text{g}/\text{g}$  hair-mercury, respectively), then we consider that watershed to be at increased risk for MI mortality exclusively due to that U.S. EGU-attributable methylmercury exposure.<sup>(58)</sup> Note, that this is not to suggest that exposures at watersheds where U.S. EGU-attributable contributions are below these cutpoints are without risk, but rather that when exposure levels exceed these cutpoints, we have increased confidence in concluding there is an increased risk of MI mortality for subsistence fishers active within that watershed. It is also important to note that in many cases, total methylmercury exposure ( *i.e.*, EGU contribution plus contributions from other sources) may exceed these confidence cutpoints such that subsistence fishers active at those watersheds would be at increased risk of MI mortality at least in part due to EGU emissions. See *White Stallion*, 748 F.3d at 1242-43 (finding reasonable the EPA's decision to consider cumulative impacts of HAP from EGUs and other sources in determining whether HAP emissions from EGUs pose a hazard to public health under CAA section 112(n)(1)(A)); see also CAA section 112(n)(1)(B) (directing the EPA to study the cumulative impacts of mercury emissions from EGUs and other domestic stationary sources of mercury).

Table 3 of the 2021 Risk TSD presents the results of the analysis of risk for MI-mortality for the subsistence fisher scenarios. As with the original RfD-based risk estimates, these results are dimensioned on two key parameters ( *self-caught fish consumption rate* and *the watershed percentile exposure level—hair-mercury  $\mu\text{g}/\text{g}$*  ). Those watershed percentile hair-mercury values that exceed the EURAMIC-based MI mortality confidence cutpoints (0.66  $\mu\text{g}/\text{g}$  hair-mercury) are shaded in the table and those cells that also exceed the KIHD-based MI mortality confidence cutpoint (1.9  $\mu\text{g}/\text{g}$  hair-mercury) are bolded. Once again, these thresholds identify levels of methylmercury exposure (hair-mercury) associated with a clear association with MI-related health effects ( *i.e.*, increased risk). Unlike the RfD-based risk estimates, for MI-mortality estimates we only focus on U.S. EGU-attributable methylmercury ( *i.e.*, whether U.S. EGU-attributable hair-mercury exceeds the cutpoints of interest).

Results for the typical subsistence fisher, representing high-end self-caught fish consumption in the U.S. population, suggest that up to 10 percent of the watersheds modeled are associated with hair-mercury levels (due to U.S. EGU mercury emissions alone) that exceed the lower EURAMIC cutpoint for MI-mortality risk, with 1 percent of modeled watersheds also exceeding the KIHD cutpoint (due to U.S. EGU-mercury emissions alone). For low-income Black subsistence fishers active in the Southeast, up to 25 percent of the watersheds exceed the lower EURAMIC confidence threshold (assuming the highest rate of fish consumption), with only the upper 1 percent of watersheds exceeding the KIHD threshold (again based only on U.S. EGU-sourced mercury exposure).

#### c. Characterization of MI-Mortality Risk for the General U.S. Population Resulting From the Consumption of Commercially-Sourced Fish

The second of the three new screening-level risk analyses estimates the incidence of MI mortality in the general U.S. population resulting from consumption of commercially-sourced fish containing methylmercury emitted from U.S. EGUs.<sup>(59)</sup> This is accomplished by first estimating the total burden of methylmercury-related MI mortality in the U.S. population and then estimating the fraction of that total increment attributable to U.S. EGUs. The task of modeling this health endpoint can involve complex mechanistic modeling of the multi-step process leading from U.S. EGU mercury emissions to mercury deposition over global/regional fisheries to bioaccumulation of methylmercury in fisheries stocks to exposure of U.S. fish consumers through consumption of those commercially-sourced fish ( *e.g.*, Giang and Selin, 2016). However, in recognition of the uncertainty associated with attempting to

model this more complex multi-step process, we have instead developed a simpler screening analysis approach intended to generate a range of risk estimates that reflects the impact of critical sources of uncertainty associated with this exposure scenario. Rather than attempting to generate a single high-confidence estimate of risk, which in our estimation is challenging given overall uncertainty associated with this exposure pathway, the goal with the bounding approach is simply to generate a range of risk estimates for MI mortality that furthers our understanding of the significant public health burden associated with EGU HAP emissions.

The bounding approach developed for this particular scenario is based on the assumption that fish sourced from global commercial fisheries are loaded by mercury deposited to those fisheries and that the fraction of that deposited mercury originating from U.S. EGUs will eventually be reflected as a fraction of methylmercury in those fish and subsequently as a fraction of MI mortality risk associated with those U.S. EGUs. One of the challenges associated with this screening analysis is how to attribute domestic EGU contributions to global fisheries and how that might vary from location to location. For simplicity, the bounding analysis includes two assumptions: (1) A potential lower-bound reflecting the assumption that U.S. fish consumption is largely sourced from global fisheries and consequently the U.S. EGU contribution to total global mercury emissions (anthropogenic and natural) can be used to approximate the U.S. EGU fractional contribution to MI mortality and (2) a potential upper-bound where we assume that fisheries closer to U.S. EGUs ( *e.g.*, within the continental U.S. or just offshore and/or along the U.S. Atlantic and Pacific coastlines) supply most of the fish and seafood consumed within the U.S., and therefore U.S. EGU average deposition over the U.S. (as a fraction of total mercury deposition) can be used to approximate the U.S. EGU fractional contribution to MI mortality ( *see* 2021 Risk TSD for more detail).<sup>(60)</sup> The EPA is continuing to review the literature (including consideration of research by FDA) to better define the relative contributions for sources of fish consumed within the U.S. Note that the bounding analysis also includes consideration for another key source of uncertainty, namely, the specification of the CR function linking methylmercury exposure to increased MI mortality and, in particular, efforts to account for increased confidence in specifying the CR function for higher levels of methylmercury exposure through the use of confidence cutpoints (section III.A.3.a). Additional detail on the stepwise process used to first generate the total U.S. burden of MI-mortality related to total methylmercury exposure and then apportion that total risk estimate to the fraction contributed by U.S. EGUs is presented the 2021 Risk TSD. Based on the 29 tons of mercury emitted by U.S. EGUs prior to implementation of MATS, the bounding estimates from the fraction of total mercury deposition attributable to U.S. EGUs at the global scale is 0.48 percent (lower bound) and 1.8 percent (upper bound). These estimated bounding percentages are important since they have a significant impact on the overall incidence of MI mortality ultimately attributable to U.S. EGU-sourced mercury.

Reflecting both the spread in the apportionment of U.S. EGU-sourced mercury (as described above) and application of the three possible applications of the CR function for MI mortality (no confidence-cutpoint, KIH D cutpoint, EURAMIC cutpoint), the estimated MI-mortality attributable to U.S. EGU-sourced mercury for the general U.S. population associated primarily with consumption of commercially-sourced fish ranges from 5 to 91 excess deaths each year.<sup>(61)</sup> For those Americans with high levels of methylmercury in their body ( *i.e.*, above certain cutpoints), the science suggests that any additional increase in methylmercury exposure will raise the risk of fatal heart attacks. Based on this screening analysis, even after imposition of the ARP and other CAA criteria pollutant requirements that also reduce HAP emissions from domestic EGU sources, we find that mercury emissions from EGUs pose a risk of premature mortality due to MI.

#### d. Characterization of IQ Loss for Children Born to Mothers in the General U.S. Population Resulting From the Consumption of Commercially Sourced Fish (and Other Food Items Containing Methylmercury)

The third new screening-level risk analysis estimates the incidence of IQ loss in children in the general U.S. population resulting from maternal consumption of commercially sourced fish containing methylmercury attributable to U.S. EGUs (resulting in subsequent prenatal exposure to methylmercury). The approach used in estimating incidence of this adverse health effect shares several elements with the approach described above for modeling MI mortality in the general U.S. population, including in particular, the method used to apportion the total methylmercury-related health burden to the fraction associated with U.S. EGU mercury emissions ( *e.g.*, use of lower and upper bound estimates of the fractional contribution of domestic EGU sources). Other elements of the modeling approach, including the specification of the number of children born annually in the U.S., the specification

of maternal baseline hair-mercury levels (utilizing NHANES data) and the characterization of the linkage between methylmercury exposure ( *in utero* ) and IQ loss, are based on methods used in the original 2011 benefits analysis completed for MATS (USEPA, 2011) and are documented in the 2021 Risk TSD.

As with the MI-mortality estimates described earlier, the two bounding estimates for the fraction of total mercury deposition attributable to U.S. EGUs at the global and regional scales (0.48 percent and 1.8 percent, respectively) have a significant impact on the overall magnitude of IQ points lost (for children born to the general U.S. population) which are ultimately attributable to U.S. EGUs. However, the EPA has relatively high confidence in modeling this endpoint due to greater confidence in the IQ loss CR function. The range in IQ points lost annually due to U.S. EGU-sourced mercury is estimated at 1,600 to 6,000 points, which is distributed across the population of U.S. children covered by this analysis. <sup>(62)</sup> Given variation in key factors related to maternal methylmercury exposure, it is likely that modeled IQ loss will not be uniformly distributed across the population of exposed children and may instead, display considerable heterogeneity. <sup>(63)</sup> The bounding analysis described here was not designed to characterize these complex patterns of heterogeneity in IQ loss across the population of children simulated and we note that such efforts would be subject to considerable uncertainty. However, it does provide evidence of specific adverse outcomes with real implications to those affected. Even small degradations in IQ in the early stages of life are associated with diminished future outcomes in education and earnings potential.

#### 4. Most HAP Benefits Cannot Be Quantified or Monetized

Despite the array of adverse health and environmental risks associated with HAP emissions from U.S. coal- and oil-fired EGUs documented above, as the above discussion demonstrates, it can be technically challenging to estimate the extent to which EGU HAP emissions will result in adverse effects quantitatively across the U.S. population absent regulation. In fact, the vast majority of the post-control benefits of reducing HAP cannot be quantified or monetized with sufficient quality to inform regulatory decisions due to data gaps, particularly with respect to sensitive populations. But that does not mean that these benefits are small, insignificant, or nonexistent. There are numerous unmonetized effects that contribute to additional benefits realized from emissions reductions. These include additional reductions in neurodevelopmental and cardiovascular effects from exposure to methylmercury, adverse ecosystem effects including mercury-related impacts on recreational and commercial fishing, health risks from exposure to non-mercury HAP, and health risks in EJ subpopulations that face disproportionately high exposure to EGU HAP.

Congress well understood the challenges in monetizing risks. As discussed in section II.B above, the statutory language in CAA section 112 clearly supports a conclusion that the intended benefit of HAP regulation is a reduction in the volume of HAP emissions to reduce assumed and identified risks from HAP with the goal of protecting even the most exposed and most sensitive members of the population. The statute requires the EPA to move aggressively to quickly reduce and eliminate HAP, placing high value on doing so in the face of uncertainty regarding the full extent of harm posed by hazardous pollutants on human health and welfare. The statute also clearly places great value on protecting even the most vulnerable members of the population, by instructing the EPA, when evaluating risk in the context of a determination of whether regulation is warranted, to focus on risk to the most exposed and most sensitive members of the population. See, e.g., CAA sections 112(c)(9)(B), 112(f)(2)(B), and 112(n)(1)(C). For example, in evaluating the potential for cancer effects associated with emissions from a particular source category under CAA section 112(f)(2), the EPA is directed by Congress to base its determinations on the maximum individual risk (MIR) to the most highly exposed individual living near a source. Similarly, in calculating the potential for non-cancer effects to occur, the EPA evaluates the impact of HAP to the most exposed individual and accounts for sensitive subpopulations.

Notably, Congress in CAA section 112 did not require the EPA to quantify risk across the entire population, or to calculate average or “typical” risks. The statutory design focusing on maximum risk to individuals living near sources acknowledges the inherent difficulty in enumerating HAP effects, given the large number of pollutants and the uncertainties associated with those pollutants, as well as the large number of sources emitting HAP. However, this does not mean that these effects do not exist or that society would not highly value these reductions, despite the fact that the post-control effects of the reductions generally cannot be quantified. The EPA has long acknowledged the difficulty of quantifying and monetizing HAP benefits. In March 2011, the EPA issued a report on

the post-control benefits and costs of the CAA. This Second Prospective Report <sup>(64)</sup> is the latest in a series of EPA studies that estimate and compare the post-control benefits and costs of the CAA and related programs over time. Notably, it was the first of these reports to include any attempt to quantify and monetize the impacts of reductions in HAP, and it concentrated on a small case study for a single pollutant, entitled “Air Toxics Case Study—Health Benefits of Benzene Reductions in Houston, 1990-2020.” As the EPA summarized in the Second Prospective Report, “[t]he purpose of the case study was to demonstrate a methodology that could be used to generate human health benefits from CAAA controls on a single HAP in an urban setting, while highlighting key limitations and uncertainties in the process. . . . Benzene was selected for the case study due to the availability of human epidemiological studies linking its exposure with adverse health effects.” (pg. 5-29). In describing the approach, the EPA noted: “[b]oth the Retrospective analysis and the First Prospective analysis omitted a quantitative estimation of the benefits of reduced concentrations of air toxics, citing gaps in the toxicological database, difficulty in designing population-based epidemiological studies with sufficient power to detect health effects, limited ambient and personal exposure monitoring data, limited data to estimate exposures in some critical microenvironments, and insufficient economic research to support valuation of the types of health impacts often associated with exposure to individual air toxics.” (pg. 5-29). These difficulties have long hindered the Agency’s ability to quantify post-control HAP impacts and estimate the monetary benefits of HAP reductions.

In preparing the benzene case study for inclusion in the Second Prospective Report, the Agency asked the Advisory Council on Clean Air Compliance Analysis (the Council) to review the approach. In its 2008 consensus advice to the EPA after reviewing the benzene case study, <sup>(65)</sup> the Council noted that “Benzene . . . has a large epidemiological database which OAR used to estimate the health benefits of benzene reductions due to CAAA controls. The Council was asked to consider whether this case study provides a basis for determining the value of such an exercise for HAP benefits characterization nationwide.” They concluded:

As recognized by OAR, the challenges for assessing progress in health improvement as a result of reductions in emissions of hazardous air pollutants (HAPs) are daunting. Accordingly, EPA has been unable to adequately assess the economic benefits associated with health improvements from HAP reductions due to a lack of exposure-response functions, uncertainties in emissions inventories and background levels, the difficulty of extrapolating risk estimates to low doses and the challenges of tracking health progress for diseases, such as cancer, that have long latency periods. . . .

The benzene case study successfully synthesized best practices and implemented the standard damage function approach to estimating the benefits of reduced benzene, however the Council is not optimistic that the approach can be repeated on a national scale or extended to many of the other 187 air toxics due to insufficient epidemiological data. With some exceptions, it is not likely that the other 187 HAPs will have the quantitative exposure-response data needed for such analysis. Given EPA’s limited resources to evaluate a large number of HAPs individually, the Council urges EPA to consider alternative approaches to estimate the benefits of air toxics regulations.

In addition to the difficulties noted by the Council, there are other challenges that affect the EPA’s ability to fully characterize post-control impacts of HAP on populations of concern, including sensitive groups such as children or those who may have underlying conditions that increase their risk of adverse effects following exposure to HAP. Unlike for criteria pollutants such as ozone and PM, the EPA lacks information from controlled human exposure studies conducted in clinical settings which enable us to better characterize dose-response relationships and identify subclinical outcomes. Also, as noted by the Council and by the EPA itself in preparing the benzene case study, the almost universal lack of HAP-focused epidemiological studies is a significant limitation. Estimated risks reported in epidemiologic studies of fine PM (PM<sub>2.5</sub>) and ozone enable the EPA to estimate health impacts across large segments of the U.S. population and quantify the economic value of these impacts. Epidemiologic studies are particularly well suited to supporting air pollution health impact assessments because they report measures of population-level risk that can be readily used in a risk assessment.

However, such studies are infrequently performed for HAP. Exposure to HAP is typically more uneven and more highly concentrated among a smaller number of individuals than exposure to criteria pollutants. Hence, conducting an epidemiologic study for HAP is inherently more challenging; for starters, the small population size means such

studies often lack sufficient statistical power to detect effects. For example, in the case of mercury, the most exposed and most sensitive members of the population may be both small and highly concentrated, such as the subsistence fishers that the EPA has identified as likely to suffer deleterious effects from U.S. EGU HAP emissions. While it is possible to estimate the potential risks confronting this population in a case-study approach (an analysis that plays an important role in supporting the public health hazard determination for mercury as discussed above in sections III.A.2 and III.A.3), it is not possible to translate these risk estimates into post-control quantitative population-level impact estimates for the reasons described above.

Further, for many HAP-related health endpoints, the Agency lacks economic data that would support monetizing HAP impacts, such as willingness to pay studies that can be used to estimate the social value of avoided outcomes like heart attacks, IQ loss, and renal or reproductive failure. In addition, the absence of socio-demographic data such as the number of affected individuals comprising sensitive subgroups further limits the ability to monetize HAP-impacted effects. All of these deficiencies impede the EPA's ability to quantify and monetize post-control HAP-related impacts even though those impacts may be severe and/or impact significant numbers of people.

Though it may be difficult to quantify and monetize most post-control HAP-related health and environmental benefits, this does not mean such benefits are small. The nature and severity of effects associated with HAP exposure, ranging from lifelong cognitive impairment to cancer to adverse reproductive effects, implies that the economic value of reducing these impacts would be substantial if they were to be quantified completely. By extension, it is reasonable to expect both that reducing HAP-related incidence affecting individual endpoints would yield substantial benefits if fully quantified, and moreover that the total societal impact of reducing HAP would be quite large when evaluated across the full range of endpoints. In judging it appropriate to regulate based on the risks associated with HAP emissions from U.S. EGUs, the EPA is placing weight on the likelihood that these effects are significant and substantial, as supported by the health evidence. The EPA's new screening-level analyses laid out in the Risk TSD for this proposal illustrate this point. Specifically, in exploring the potential for MI-related mortality risk attributable to mercury emissions from U.S. EGUs, the EPA's upper bound estimate is that these emissions may contribute to as many as 91 additional premature deaths each year. The value society places on avoiding such severe effects is very high; as the EPA illustrates in the valuation discussion in the 2021 Risk TSD, the benefit of avoiding such effects could approach \$720 million per year. Similarly, for IQ loss in children exposed *in utero* to U.S. EGU-sourced mercury, our upper bound estimate approaches 6,000 IQ points lost which could translate into a benefit approaching \$50 million per year.

These estimates are intended to illustrate the point that the HAP impacts are large and societally meaningful, but not to suggest that they are even close to the full benefits of reducing HAP. There are many other unquantified effects of reducing EGU HAP that would also have substantial value to society. As described above, mercury alone is associated with a host of adverse health and environmental effects. The statute clearly identifies this basket of effects as a significant concern in directing the EPA to study them specifically. If the EPA were able to account for all of these post-control effects in our quantitative estimates, the true benefits of MATS would be far clearer. However, available data and methods currently preclude a full quantitative accounting of the post-control impacts of reducing HAP emissions from U.S. EGUs and a monetization of these impacts.

There are other aspects of social willingness to pay that are not accounted for in the EPA's quantitative estimate of benefits either. For example, in previous MATS-related rulemakings and analysis, the EPA has not estimated what individuals would be willing to pay in order to reduce the exposure of *others* who are exposed (even if they are not experiencing high levels of HAP exposure themselves). These may be considered and quantified as benefits depending on whether it is the health risks to others in particular that is motivating them. <sup>(66)</sup> For example, Cropper *et al.* (2016) found that focus group participants indicated a preference for more equitable distribution of health risks than for income, which indicates that it is specifically the risks others face that was important to the participants. <sup>(67)</sup> This result is particularly important as exposure to HAP is often disproportionately borne by underserved and underrepresented communities (Bell and Ebisu, 2012). <sup>(68)</sup> Unfortunately, studies to quantify the willingness to pay for a more equitable distribution of HAP exposures are limited, so quantification of this benefit likely cannot be performed until new research is conducted.

The HAP-related legislative history for the 1990 Amendments includes little discussion of the monetized benefits of HAP, perhaps due to these attendant difficulties. When such monetized benefits were estimated in several outside reports submitted to Congress before passage of the 1990 Amendments, the estimates were based on reduced cancer deaths and the value of the benefits that are quantified were estimated to be small as compared to the estimated costs of regulating HAP emissions under CAA section 112. See, e.g., *A Legislative History of the Clean Air Act Amendments of 1990*, Vol. I at 1366-67 (November 1993) (estimating the total annual cost of CAA section 112 to be between \$6 billion and \$10 billion per year and the estimated annual benefits to be between \$0 and \$4 billion per year); *id.* at 1372-73 (estimating the total annual cost of CAA section 112 to be between \$14 billion and \$62 billion per year and the estimated annual benefits to be between \$0 and \$4 billion per year). Despite the apparent disparity of estimated costs and monetized benefits, Congress still enacted the revisions to CAA section 112. Thus, it is reasonable to conclude that Congress found HAP emissions to be worth regulating even without evidence that the monetized benefits of doing so were greater than the costs. The EPA believes this stems from the value that the statute places on reducing HAP regardless of whether the post-control benefits of doing so can be quantified or monetized, and the statute's purpose of protecting even the most exposed and most sensitive members of the population.

#### 5. Characterization of HAP Risk Relevant to Consideration of Environmental Justice

In assessing the adverse human health effects of HAP pollution from EGUs, we note that these effects are not borne equally across the population, and that some of the most exposed individuals and subpopulations—protection of whom is, as noted, of particular concern under CAA section 112—are minority and/or low-income populations. Executive Order 12898 (59 FR 7629; February 16, 1994) establishes Federal executive policy on EJ issues. That Executive Order's main provision directs Federal agencies, to the greatest extent practicable and permitted by law, to make EJ part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations. Executive Order 14008 (86 FR 7619; February 1, 2021) also calls on Federal agencies to make achieving EJ part of their missions “by developing programs, policies, and activities to address the disproportionately high and adverse human health, environmental, climate-related and other cumulative impacts on disadvantaged communities, as well as the accompanying economic challenges of such impacts.” That Executive Order also declares a policy “to secure environmental justice and spur economic opportunity for disadvantaged communities that have been historically marginalized and overburdened by pollution and under-investment in housing, transportation, water and wastewater infrastructure, and health care.” Under Executive Order 13563, Federal agencies may consider equity, human dignity, fairness, and distributional considerations, where appropriate and permitted by law.

In the context of MATS, exposure scenarios of clear relevance from an EJ perspective include the full set of subsistence fisher scenarios included in the watershed-level risk assessments completed for the rule. Subsistence fisher populations are potentially exposed to elevated levels of methylmercury due to their elevated levels of self-caught fish consumption which, in turn, are often driven either by economic need (i.e., poverty) and/or cultural practices. In the context of MATS, we completed watershed-level assessments of risks for a broad set of subsistence fisher populations covering two health endpoints of clear public health significance including: (a) Neurodevelopmental effects in children exposed prenatally to methylmercury (the methylmercury-based RfD analysis described in the 2011 Final Mercury TSD) and (b) potential for increased MI-mortality risk in adults due to methylmercury exposure (section III.A.3.b above).

The general subsistence fisher population that was evaluated nationally for both analyses was not subdivided by socioeconomic status, race, or cultural practices.<sup>(69)</sup> Therefore, the risk estimates derived do not fully inform our consideration of EJ impacts, although the significantly elevated risks generated for this general population are clearly relevant from a public health standpoint. However, the other, more differentiated subsistence fisher populations, which are subdivided into smaller targeted communities, are relevant in the EJ context and in some instances were shown to have experienced levels of risk significantly exceeding those of the general subsistence fisher population, as noted earlier in section III.A.3.b.

In particular, for the watershed analysis focusing on the methylmercury RfD-based analysis ( *i.e.*, neurodevelopmental risk for children exposed prenatally), while the general female fisher scenario suggested that modeled exposures (from U.S. EGU-sourced mercury alone) exceeded the methylmercury RfD in approximately 10 percent of the watersheds modeled (2011 Final Mercury TSD, Table 2-6), for low-income Black subsistence fisher females in the Southeast, modeled exposures exceeded the RfD in approximately 25 percent of the watersheds. These results suggest a greater potential for adverse effects in low-income Black populations in the Southeast. Similarly, while the general subsistence fisher had exposure levels suggesting an increased risk for MI-mortality risk in 10 percent of the watersheds modeled, two sub-populations were shown to be even further disadvantaged. Low-income Black and white populations in the Southeast and tribal fishers active near the Great Lakes had the potential for increased risk in 25 percent of the watersheds modeled. <sup>(70)</sup> Both of these results (the neurodevelopmental RfD-based analysis and the analysis of increased MI-mortality risk) suggest that subsistence fisher populations that are racially or culturally, geographically, and income-differentiated could experience elevated risks relative to not only the general population but also the population of subsistence fishers generally. We think these results are relevant in considering the benefits of regulating EGU HAP.

## 6. Overview of Health and Environmental Effects Associated With Non-HAP Emissions From EGUs

Alongside the HAP emissions enumerated above, U.S. EGUs also emit a substantial quantity of criteria pollutants, including direct PM<sub>2.5</sub>, nitrogen oxides (NO<sub>x</sub>) (including NO<sub>2</sub>), and SO<sub>2</sub>, even after implementation of the ARP and numerous other CAA requirements designed to control criteria pollutants. In the 2011 RIA, for example, the EPA estimated that U.S. EGUs would emit 3.4 million tons of SO<sub>2</sub> and 1.9 million tons of NO<sub>x</sub> in 2015 prior to implementation of any controls under MATS ( *see* Table ES-2). These EGU SO<sub>2</sub> emissions were approximately twice as much as all other sectors combined (EPA SO<sub>2</sub> Integrated Science Assessment, 2017). <sup>(71)</sup> These pollutants contribute to the formation of PM<sub>2.5</sub> and ozone criteria pollutants in the atmosphere, the exposure to which is causally linked with a range of adverse public health effects. SO<sub>2</sub> both directly affects human health and is a precursor to PM<sub>2.5</sub>. Short-term exposure to SO<sub>2</sub> causes respiratory effects, particularly among adults with asthma. SO<sub>2</sub> serves as a precursor to PM<sub>2.5</sub>, the exposure to which increases the risk of premature mortality among adults, lung cancer, new onset asthma, exacerbated asthma, and other respiratory and cardiovascular diseases. Likewise, EGU-related emissions of NO<sub>x</sub> will adversely affect human health in the form of respiratory effects including exacerbated asthma. NO<sub>x</sub> is a precursor pollutant to both PM<sub>2.5</sub> and ground-level ozone. Exposure to ozone increases the risk of respiratory-related premature death, new onset asthma, exacerbated asthma, and other outcomes. Fully accounting for the human health impacts of reduced EGU emissions under MATS entails quantifying both the direct impacts of HAP as well as the avoided premature deaths and illnesses associated with reducing these co-emitted criteria pollutants. Similarly, U.S. EGUs emit substantial quantities of CO<sub>2</sub>, a powerful greenhouse gas (GHG): The EPA estimated these emissions at 2.23 million metric tpy in 2015 (2011 RIA, Table ES-2). The environmental impacts of GHG emissions are accounted for through the social cost of carbon, <sup>(72)</sup> which can be used to estimate the benefits of emissions reductions due to regulation.

Not all of the non-HAP benefits of MATS were quantified or monetized in the 2011 RIA. However, the EPA thoroughly documented these potential effects and identified those for which quantification and/or monetization was possible. Specifically, the EPA calculated the number and value of avoided PM<sub>2.5</sub>-related impacts, including 4,200 to 11,000 premature deaths, 4,700 nonfatal heart attacks, 2,600 hospitalizations for respiratory and cardiovascular diseases, 540,000 lost work days, and 3.2 million days when adults restrict normal activities because of respiratory symptoms exacerbated by PM<sub>2.5</sub> (2011 RIA, p. ES-3). We also estimated substantial additional health improvements for children from reductions in upper and lower respiratory illnesses, acute bronchitis, and asthma attacks. In addition, we included in our monetized co-benefits estimates the effect from the reduction in CO<sub>2</sub> emissions resulting from this rule, based on the interagency SC-CO<sub>2</sub> estimates. These benefits stemmed from imposition of MATS and would be coincidentally realized alongside the HAP benefits.

## 7. Summary of Public Health Hazards Associated With Emissions From EGUs

The EPA is proposing to find that the evidence provided in this section of the preamble, informed where possible with new scientific evidence available since the publication of the 2016 Supplemental Finding, once again demonstrates that HAP released from U.S. EGUs represent a significant public health hazard absent regulation

under CAA section 112. As noted earlier, the EPA found that even after imposition of the other requirements of the CAA, EGUs were the largest domestic source of mercury, HF, HCl, and selenium and among the largest domestic contributors of arsenic, chromium, cobalt, nickel, hydrogen cyanide, beryllium, and cadmium. The EPA has documented a wide range of adverse health effects in children and adults associated with mercury including, in particular, neurodevelopmental effects in children exposed prenatally ( e.g., IQ, attention, fine motor-function, language, and visual spatial ability) and a range of cardiovascular effects in adults including fatal MI and non-fatal IHD. Non-mercury HAP have also been associated with a wide range of chronic health disorders ( e.g., irritation of the lung; decreased pulmonary function, pneumonia, or lung damage; detrimental effects on the central nervous system; and damage to the kidneys). Furthermore, three of the key metal HAP emitted by EGUs (arsenic, chromium, and nickel) have been classified as human carcinogens and there is evidence to suggest that, prior to MATS, emissions from these sources had the potential to result in cancer risks greater than 1-in-1 million.

Further, this section describes the results from several new screening-level risk assessments considering mercury from domestic EGU sources. These risk assessments focused on two broad populations of exposure: (a) Subsistence fishers exposed to mercury through self-caught fish consumption within the continental U.S. and (b) the general U.S. population exposed to mercury through the consumption of commercially-sourced fish ( i.e., purchased from restaurants and food stores). The results of these screening-level risk assessments are useful for informing our understanding about the potential scope and public health importance of these impacts, but remaining uncertainties prohibit precise estimates of the size of these impacts currently. For example, numerous studies considering multiple, large cohorts have shown that people exposed to high amounts of mercury are at higher risk of fatal and non-fatal CVD. While U.S. EGUs are only one of multiple global sources that contribute to this mercury exposure, the EPA's screening analysis suggests the potential for U.S. EGU emissions of mercury to contribute to premature mortality in the general U.S. population.

Furthermore, as part of the subsistence fisher analyses, we included scenario modeling for a number of EJ-relevant populations showing that several populations (including low-income Blacks and whites in the Southeast and tribal populations near the Great Lakes) had risk levels that were significantly above the general subsistence fisher population modeled for the entire U.S. As noted earlier, the EPA believes that Congress intended in CAA section 112 to address risks to the most exposed and most sensitive members of the public. These additional risk assessments suggest that there are populations that are particularly vulnerable to EGU HAP emissions, including populations of concern from an EJ standpoint.

MATS plays a critical role in reducing the significant volume and risks associated with EGU HAP emissions discussed above. Mercury emissions have declined by 86 percent, acid gas HAP by 96 percent, and non-mercury metal HAP by 81 percent since 2010 (pre-MATS). See Table 4 at 84 FR 2689 (February 7, 2019). MATS is the only Federal requirement that guarantees this level of HAP control from EGUs. At the same time, the concomitant reductions in CO<sub>2</sub>, NO<sub>x</sub>, and SO<sub>2</sub>, also provide substantial public health and environmental benefits. Given the numerous and important public health and environmental risks associated with EGU emissions, the EPA again concludes that the advantages of regulating HAP emissions from this sector are significant. Acknowledging the difficulties associated with characterizing risks from HAP emissions discussed earlier in this section, we solicit comments about the health and environmental hazards of EGU HAP emissions discussed in this section and the appropriate approaches for quantifying such risks, as well any information about additional risks and hazards not discussed in this proposal.

## B. Consideration of Cost of Regulating EGUs for HAP

### 1. Introduction

In evaluating the costs and disadvantages of MATS, we begin with the costs to the power industry of complying with MATS. This assessment uses a sector-level (or system-level) accounting perspective to estimate the cost of MATS, looking beyond just pollution control costs for directly affected EGUs to include incremental costs associated with changes in fuel supply, construction of new capacity, and costs to non-MATS units that were also projected to adjust operating decisions as the power system adjusted to meet MATS requirements. Such an approach is warranted due to the nature of the power sector, which is a large, complex, and interconnected industry. This means that while the MATS requirements are directed at a subset of EGUs in the power sector, the compliance

actions of the MATS-regulated EGUs can affect production costs and revenues of other units due to generation shifting and fuel and electricity price changes. Thus, the EPA's projected compliance cost estimate represents the incremental costs to the entire power sector to generate electricity, not just the compliance costs projected to be incurred by the coal- and oil-fired EGUs that are regulated under MATS. Limiting the cost estimate to only those expenditures incurred by EGUs directly regulated by MATS would provide an incomplete estimate of the costs of the rule.

Using this broad view, in the 2011 RIA we projected that the compliance cost of MATS would be \$9.6 billion per year in 2015. <sup>(73)</sup> This estimate of compliance cost was based on the change in electric power generation costs between a base case without MATS and a policy case where the sector complies with the HAP emissions limits in the final MATS. The EPA generated this cost estimate using the Integrated Planning Model (IPM). <sup>(74)</sup> This model is designed to reflect electricity markets as accurately as possible using the best available information from utilities, industry experts, natural gas and coal market experts, financial institutions, and government statistics. Notably, the model includes cost and performance estimates for state-of-the-art air pollution control technologies with respect to mercury and other HAP controls. But there are inherent limits to what can be predicted *ex ante*. And because the estimate was made 5 years prior to full compliance with MATS, stakeholders, including a leading power sector trade association, have indicated that our initial cost projection significantly overestimated actual costs expended by industry. There are significant challenges to producing an *ex post* cost estimate that provides an apples-to-apples comparison to our initial cost projections, due to the complex and interconnected nature of the industry. However, independent analyses provided to the EPA indicate that we may have overestimated the cost of MATS by billions of dollars per year. Moreover, there have been significant changes in the power sector in the time since MATS was promulgated that were not anticipated in either EPA or U.S. Energy Information Administration (EIA) projections at the time. <sup>(75)</sup> Entirely outside of the realm of EPA regulation, there were dramatic shifts in the cost of natural gas and renewables, state policies, and Federal tax incentives, which have also further encouraged construction of new renewables. These have led to significantly faster and greater than anticipated retirement of coal capacity and coal-fired generation.

While there are significant limitations to producing an *ex post* cost estimate, we have endeavored, where possible, to approximate the extent of our overestimate. The unexpected shifts in the power sector, including the rapid increase in natural gas supplies that occurred after promulgation of MATS, resulted in our projected estimates of natural gas prices to be approximately double what they were in actuality. Incremental natural gas expenditures accounted for approximately 25 percent of the \$9.6 billion compliance cost estimate for 2015 in the 2011 RIA. The market trends of the power sector also had major impacts on the number of controls installed and operated on coal-fired EGUs in the years following promulgation of MATS. With respect to just pollution control installation and operation, we project that we overestimated annual compliance costs by at least \$2.2 to 4.4 billion per year, simply as a result of fewer pollution controls being installed than were estimated in the 2011 RIA. Though this range of an overestimate is limited to costs associated with pollution controls and operation, those costs made up 70 percent of the projected \$9.6 billion figure.

We additionally find that the controls that were installed at MATS-regulated EGUs were likely both less expensive and more effective in reducing pollution than originally projected, resulting in our estimate likely being too high for these reasons as well. Lastly, since completing the 2011 RIA, we have updated several assumptions in our modeling that would also have resulted in a lower cost estimate had they been incorporated into our modeling at the time of the rule. Taking into account the above considerations, we believe we overestimated the cost of MATS by billions of dollars.

We next examine the projected cost of MATS—both total cost and specific types of costs—using sector-level metrics that put those cost estimates in context with the economics of the power sector. The reason we examine these metrics is to better understand the disadvantages that expending these costs had on the EGU industry and the public more broadly, just as on the benefits side we look beyond the volume of pollution reductions to the health and environmental advantages conferred by the reductions.

For purposes of these analyses, we use the 2011 RIA projections, keeping in mind our newer analyses, which indicated that those projections were almost certainly overestimated. Specific to the power sector, we evaluate the projected costs of the rule to revenues from electricity sales across nearly 20 years, and we compare the projected expenditures required under the rule with historic expenditures by the industry over the same time period. We additionally evaluate broader impacts on the American public by looking at projected effects of MATS on retail electricity prices and our analyses of whether the power sector could continue to provide adequate and reliable electricity after imposition of the rule. We find that, when viewed in context, the projected costs of MATS to both the power sector and the public were small relative to these metrics and well within the range of historical variability. Moreover, experience has borne out our projection that the EGU sector could continue to provide adequate, reliable, and affordable electricity to the American public after the imposition of the rule.

Section III.B.2 contains our discussion of the ways in which the compliance costs for MATS were likely overestimated. Section III.B.3 expands upon and re-evaluates the cost metrics used in the 2016 Supplemental Finding by adding post-promulgation information to our analysis, and we discuss impacts on power sector generating capacity. In section III.B.4, we propose to reaffirm additional cost considerations regarding the availability and cost of control technologies discussed in earlier rulemakings, and in section III.B.5, we provide our proposed conclusions regarding the costs, or disadvantages, of regulating HAP from EGUs.

## 2. Compliance Cost Projections in the 2011 RIA Were Likely Significantly Overestimated

In issuing this proposal, the EPA finds itself in a position Congress was not likely to have contemplated when it promulgated the 1990 Amendments. The statute contemplated that the EPA would have completed the required studies and presumably made its determination more than 20 years ago. Due to litigation and multiple changes of administration following *Michigan*, we are, at this point, nearly 10 years after promulgation of the regulation about which we are making a threshold determination, and 5 years after full implementation of that regulation. The vast majority of MATS-affected sources were required to be in compliance with the rule's requirements by April 2016, and installation of new controls-or upgrades to existing controls-were in place by 2017. <sup>(76)</sup> This means we now have on hand unit-level data regarding installations, a clearer picture about market trends, and updated, more accurate assumptions that, taken together, produce a very different picture of the actual costs of MATS than what we projected when we reaffirmed the appropriate and necessary determination and promulgated the rule in 2012. Therefore, while the Agency considers that the information that was available at the time of MATS promulgation provided a valid analytical basis for the threshold appropriate and necessary determination, because many years have elapsed since then, the EPA believes it is reasonable to examine how the power sector has evolved since MATS was finalized and, with the benefit of hindsight, compare important aspects of the 2011 RIA projections with what actually happened since MATS was promulgated. Because our obligation under CAA section 112(n)(1)(A) is to fully consider the advantages and disadvantages of regulating a large, critically important industry, whose role impacts the lives of every American, we think it is important to evaluate and consider the best, currently available information, even if, as discussed in sections III.B.3 and 4, the pre-existing record supports the same conclusion. This *ex post* examination demonstrates that the EPA almost certainly significantly overestimated compliance costs in the 2011 RIA, which further supports the determination that regulation is appropriate and necessary after considering cost. We also do not view this updated, post-hoc evaluation of what happened post-promulgation as undermining the record we established in 2012. Models are not invalidated "solely because there might be discrepancies between those predictions and the real world. That possibility is inherent in the enterprise of prediction." *EME Homer City Generation, L.P. v. EPA*, 795 F.3d 118, 135-36 (D.C. Cir. 2015).

In an ideal world, with perfect information, we would be able to generate an *ex post* analysis of regulatory costs that could be compared to our *ex ante* cost estimate prepared at the time MATS was issued. However, it is extremely challenging to produce rigorous retrospective estimates of regulatory costs. A literature review and series of case studies performed by EPA staff provides insights on how analysts can perform retrospective cost analysis. <sup>(77)</sup> Kopits *et al.* (2015) identifies several challenges associated with *ex post* cost assessments, including data limitations with respect to how facilities chose to comply with regulations and comprehensive facility-level pollution abatement costs. A key component to a rigorous retrospective analysis noted by the authors that can be

particularly difficult to achieve is an accurate definition of the counterfactual, that is, what would have occurred absent the rule. It is this counterfactual that provides the baseline against which the incremental costs of regulation are estimated.

In the case of MATS, to construct an estimate of *ex post* implementation costs that is directly comparable to the *ex ante* 2011 RIA cost estimate, we would first need to accurately attribute changes in the power sector that were due to MATS requirements rather than to market and technological changes, other regulations, or, importantly, combinations of these factors ( *i.e.*, properly specify the counterfactual). Second, we would need actual information of the incremental costs that had been associated with facility-level operational changes due to MATS, such as observed changes in dispatch, actual fuel consumption, and how controls in MATS-affected units were actually operated. Even the operation of non-MATS affected units would be relevant to such an analysis, because operational decisions are interconnected on the grid via dispatch decisions as well as through fuel markets. While there may be approaches such as econometric analysis, simulation modeling, and event study analysis that could capture and estimate components of the problem identified above and derive an estimate of *ex post* MATS costs, the approach would very likely require different methods and assumptions than the 2011 RIA estimates which were based on the comparison of two forward-looking sets of projections. Even if we undertook such additional analysis or modeling, ultimately we would still only be able to provide a new *estimate* of regulatory costs, not an *actual* cost. Given how challenging it is to produce rigorous retrospective estimates of regulatory costs, particularly at a system-level, an *ex post* analysis is better suited to comparing particular aspects of the analysis, which can help us understand whether costs in the 2011 RIA were over- or under-estimated and can yield a general sense of how much reality diverged from the projection, than to attempting to generate a new and precise “actual” total compliance cost estimate for MATS.

Estimating retrospective costs for a rule of the magnitude of MATS is an especially significant challenge because the rule regulates hundreds of units within a complex, interdependent, and dynamic economic sector. Units within the power sector are also subject to many regulatory requirements and other economic drivers. While we can observe the decisions of the sector and individual units in terms of decisions on controls, fuels, and retirement, we cannot pinpoint the reason(s) behind each unit-level decision. With respect to identifying the counterfactual against which to evaluate retrospective compliance costs, several unforeseen factors since MATS promulgation have driven changes in the power sector that have led to the composition of the current fleet being different than the fleet projected in the 2011 RIA. For example, dramatic increases in the supply of natural gas, along with advances in cost and performance of renewable generation technologies and low electricity demand growth, none of which were fully anticipated in the 2011 RIA, have made strong contributions to shifts away from coal-fired generation. <sup>(78</sup> <sup>79)</sup> Additionally, other EPA regulations such as the Disposal of Coal Combustion Residuals from Electric Utilities final rule, the Steam Electric Power Generating Effluent Guidelines—2015 Final Rule, and the 2020 Steam Electric Reconsideration Rule, were promulgated after MATS. <sup>(80)</sup> While the compliance periods of these rules all postdate the MATS compliance date, utilities are likely to consider multiple regulations simultaneously when making planning decisions, a likelihood that also complicates the identification of the counterfactual scenario of a world without MATS that is needed to generate an *ex post* incremental cost estimate of MATS that would be directly comparable to the *ex ante* 2011 RIA cost estimate.

Even though it is extremely challenging to produce the type of *ex post* incremental cost estimate discussed above, several stakeholders have conducted analyses, focusing on different components of the regulation's cost, to assess actual costs of compliance. While none of these estimates can be precisely compared against the EPA *ex ante* estimates because they use different methods than the power sector modeling the EPA used in the 2011 RIA, all of the independent analyses suggested that the actual compliance costs expenditures were significantly lower—by billions of dollars—than the EPA estimated in the 2011 RIA.

First, a 2015 analysis by Andover Technology Partners focused on the capital and operating costs associated with the actual installation and operation of pollution control equipment at MATS-regulated units and made two key findings: the number of installed controls was significantly lower than the number of controls that was projected in the 2011 RIA and the cost of the installed controls was generally lower than the control costs that the EPA assumed in the 2011 RIA modeling. Based on these findings, the study estimated that the EPA's projected cost of compliance

was over-estimated by approximately \$7 billion. <sup>(81 82)</sup> In other words, the Andover Technology Partners estimated that the EPA's projected cost was approximately four times higher than their retrospective estimate of cost, which they estimated to be approximately \$2 billion per year.

Second, a 2017 study performed by M.J. Bradley & Associates (MJB&A) used information from the EIA and estimated that owners and operators of coal-fired EGUs incurred total capital expenditures on environmental retrofits of \$4.45 billion from December 2014 to April 2016. <sup>(83)</sup> To the EPA's understanding, the MJB&A cost estimate represents total upfront capital costs (not ongoing operating and maintenance expenditures), and is not annualized as was the capital expenditure in the 2011 RIA-based projected cost estimate. For comparison, the estimated total upfront (not annualized) capital expenditures underpinning the 2011 RIA annual compliance cost estimate is about \$36.5 billion, which is more than eight times higher than the MJB&A estimates. This result suggests that the capital cost component of the 2011 RIA cost projections was significantly overestimated, potentially by a factor of more than eight.

Third, the Edison Electric Institute (EEI), the association that represents all U.S. investor-owned electric companies, estimated that by April 2019, owners and operators of coal- and oil-based EGUs incurred *cumulative* (not annual) compliance costs of more than \$18 billion to comply with MATS, including both capital and operations and maintenance costs since MATS became effective in April 2012. <sup>(84)</sup> In order to provide a simple comparison between the EEI figure, which was incurred over 7 years, and the annualized amount presented in the 2011 RIA (\$9.6 billion), we can divide the EEI figure by 7 to estimate an average annual amount of approximately \$2.6 billion, which is similar to the Andover Technology Partners estimate of approximately \$2 billion. Also in line with the Andover Technology Partners estimate, EEI's estimate suggests that the annual costs related to MATS compliance were overestimated in the 2011 RIA by approximately \$7 billion. While there is some uncertainty in the amount of time over which those costs were incurred, as well as the exact nature of those expenditures, it is clear that the information provided by EEI supports a conclusion that the costs of compliance with MATS were significantly lower than the Agency's projections.

In summary, it is the EPA's understanding that two of these studies indicate that the 2011 RIA may have overestimated annual compliance costs by approximately \$7 billion, and the third study finds that the projected total upfront capital costs may have been overestimated by a factor of more than eight. While each of these retrospective cost estimates is developed from bases that are dissimilar from one another and, in particular, from how the EPA developed the prospective cost estimates in the 2011 RIA, each of the independent analyses indicate that the costs of MATS are likely significantly less than the EPA estimated in the 2011 RIA.

For this proposal, the EPA has evaluated whether the *ex ante* estimates in the 2011 RIA were likely accurate, overestimated, or underestimated, and the details of the EPA's new analysis are contained in the docketed TSD (referred to herein as the "Cost TSD"). <sup>(85)</sup> Consistent with our systems-level approach, we begin our analysis with an evaluation of natural gas expenditures during the relevant time period. The rapid decrease in the price of natural gas during this time period affected U.S. power generation profoundly, including U.S. EGU fuel expenditures; this has significant implications for our *ex post* analysis because natural gas expenditures constituted approximately 25 percent of the projected 2015 compliance costs in the 2011 RIA. <sup>(86)</sup> These market shifts in the industry also impacted expenditures associated with the installation and operation of pollution control equipment at MATS-affected facilities. Those costs constituted a majority—about 70 percent—of the projected annual compliance costs in 2015. The following sections closely examine these two components of the compliance cost and use available information to evaluate whether the projected compliance costs reported in the 2011 RIA were likely higher or lower than actual costs. We also review important cost assumptions used in the 2011 RIA. Taken together, this suite of quantitative and qualitative evaluations indicates that the projected costs in the 2011 RIA were almost certainly significantly overestimated. We find that the 2011 RIA's estimate of the number of installations alone led to an overestimate of about \$2.2 to \$4.4 billion, and that if recent updates to the cost and performance assumption for pollution controls had been reflected in the 2011 RIA modeling, the projected compliance costs would likely have been even lower (suggesting the overestimate could be greater than \$4.4 billion).

#### a. Natural Gas Supply

The natural gas industry has undergone significant change in recent years. Starting in the mid-2000s, technological changes in natural gas drilling and extraction initiated major market changes that resulted in significant increases to domestic supplies of natural gas. As these technologies have continued to advance, they have had a lasting impact on natural gas markets, resulting in major shifts in the economics of electric sector operations given the abundant supply of natural gas at relatively low costs. This section summarizes these changes and the implications for the cost projection presented in the 2011 RIA.

In 2005, the EIA estimated that proved reserves of natural gas were 213 trillion cubic feet (tcf). <sup>(87)</sup> In 2019, the estimate of proved reserves was 495 tcf, an increase of 132 percent. The market effects of this major supply shift were profound across the economy, but especially for the power sector. By the end of 2019, aided by advances in drilling and hydraulic fracturing techniques, natural gas production from tight and shale gas formations was the major source of domestic production ( see Table 1 below) and had increased three-fold from 2005 production levels.

Table 1—U.S. Natural Gas Production, by Source

Year	Tight/shale gas	Other lower 48 onshore	Lower 48 offshore	Other
2005	7.2	5.1	3.4	2.3
2006	8.0	5.1	3.2	2.3
2007	9.0	4.9	3.1	2.3
2008	10.3	4.9	2.6	2.4
2009	11.1	4.5	2.7	2.4
2010	12.4	4.2	2.5	2.2
2011	14.8	4.0	2.0	2.1
2012	16.7	3.7	1.6	2.0
2013	17.6	3.5	1.4	1.7
2014	19.5	3.4	1.3	1.6
2015	21.0	3.2	1.4	1.5
2016	21.1	2.8	1.3	1.4
2017	22.2	2.7	1.1	1.3
2018	25.7	2.7	1.0	1.3
2019	29.3	2.4	1.0	1.2
2020	29.2	2.3	1.2	1.2

## Note

“Other” includes production from Alaska and Coalbed Methane sources.

As a result, the natural gas market underwent a long period of sustained low prices ( see Table 2 below). These market shifts were not fully anticipated or predicted by observers, as indicated by natural gas futures prices at the time of MATS promulgation. Although these changes took root in the mid-2000s, the lasting market disruption would take more time to cement itself. From 2010 through 2019, the U.S became one of the world's leading producers of natural gas, breaking domestic production records year-on-year through the decade, while maintaining record-low prices. During this timeframe, the U.S. shifted from a *total* net energy importer to an exporter, <sup>(88)</sup> while maintaining some of the lowest relative natural gas prices globally. <sup>(89)</sup>

Table 2—Natural Gas Prices

Year	<b>NYMEX natural gas Henry Hub natural gas futures (\$/MMBtu), annual average, as of: 2011-03-16</b>	<b>NYMEX natural gas Henry Hub natural gas futures (\$/MMBtu), annual average, as of: 2011-12-21</b>	<b>Henry Hub spot natural gas index annual average price (\$/MMBtu)</b>
2005			8.63
2006			6.74
2007			6.96
2008			8.90
2009			3.94
2010			4.37
2011	4.24		4.00
2012	4.91	3.43	2.75
2013	5.31	4.07	3.73
2014	5.67	4.43	4.37
2015	6.04	4.66	2.63
2016	6.36	4.90	2.51
2017	6.67	5.16	2.98
2018	6.97	5.43	3.16
2019	7.25	5.70	2.56
2020	7.50	5.96	2.03
2021	7.76	6.23	
2022	8.02	6.50	
2023	8.28	6.78	
2024		7.06	

The EPA projected a 2015 natural gas price of roughly \$5/MMBtu when MATS was finalized in December 2011, which was a reasonable expectation based on prevailing market conditions at that time. However, natural gas prices post-MATS promulgation ended up being considerably lower than anticipated, which resulted in major shifts in the economics of fossil fuel-fired electric generating technologies ( see Table 2 above and Chart A-1 in the Cost TSD). From 2005 through 2010, annual average natural gas prices (at Henry Hub) averaged about \$6.60/MMBtu. Several years later, as MATS compliance began, prices averaged roughly \$2.75/MMBtu for the years 2015 through 2019. This market shift greatly changed the economics of power plant operation for fossil fuel-fired facilities, with the electric sector surpassing the industrial sector to become the largest consumer of natural gas (38 percent of the total in 2020),<sup>(90)</sup> and gas-fired generators becoming the leading source of electric generation in the electric sector, representing 40 percent of total generation in 2020.<sup>(91)</sup>

The modeling supporting the 2011 RIA did not anticipate this major change in natural gas supply, which has clearly had a significant impact on the electric power sector and those sources covered by MATS. While we do not quantify the impact this change would have on the projected compliance costs associated with incremental changes in natural gas use and price (about 25 percent of the total projected compliance cost in the 2011 RIA), we note that any closures of covered units that occurred as a result of the changed relative economics of fuel prices would decrease the MATS-related compliance costs for the sector. These closures reduced the amount of control capacity necessary for compliance with MATS, and we estimate below a range of costs associated with the overestimation of control installations in the 2011 RIA.

Several researchers have investigated the role of relative fuel prices as a factor in decisions that were made regarding closures of coal-fired units around 2015. Generally, these studies attribute closures primarily to the decrease in natural gas prices, and they also note smaller factors such as advances in the cost and performance of renewable generating sources, lower-than-anticipated growth in electricity demand, and environmental regulations.

For example, Linn and McCormack (2019) developed a simulation model of the U.S. Eastern Interconnection that reproduced unit operation, emissions, and retirements over the 2005-2015 period. The authors use this model to explain the relative contributions of demand, natural gas prices, wind generation, and environmental regulations, including MATS, to the changes in the share of coal in electricity generation. The results showed that lower electricity consumption and natural gas prices account for a large majority of the declines in coal plant profitability and resulting retirements. The authors found that the environmental regulations they modeled, NO<sub>x</sub> emissions caps and MATS, played a relatively minor role in declines of coal plant profitability and retirements.

Additionally, Coglianesse *et al.* (2020) developed a statistical modeling approach to enable the decomposition of changes in U.S. coal production from 2008-2016 into changes due to a variety of factors, including changes in electricity demand, natural gas prices relative to coal, renewable portfolio standards, and environmental regulations that affect coal-fired plants. The results indicated that declines in natural gas prices explained about 92 percent of the decrease in coal production between 2008 and 2016. Air regulations, including MATS, explained about 6 percent of the drop in coal production. The study attributed about 5.2 GW of coal-fired EGU retirements to MATS.

These studies both demonstrate that the decrease in natural gas prices played a significant role in closures of coal-fired EGUs. While we do not quantify the impact this change had on the projected costs included in the 2011 RIA, we note that any closures of covered units that occurred as a result of the dramatically changed relative economics of fuel prices would decrease the MATS-related compliance costs for the sector.

#### b. Projected Versus Observed Pollution Control Installations

The 2011 RIA reported a sector-level compliance cost of \$9.6 billion annually in 2015. The majority of those costs—about 70 percent—represented the incremental annualized capital and annual operation and maintenance (O&M) costs associated with installation and operation of pollution controls for compliance with MATS at coal steam units. Given the time that has passed, we can now compare the incremental projected pollution control capacity reported in the 2011 RIA with available information regarding actual (observed) control installations. For this proposal, therefore, the EPA has compared observed installations and costs over 2013-2016 to unit-level estimates of the control installation capacity and associated costs presented in the 2011 RIA. This analysis demonstrates, subject to the caveats and uncertainty discussed below, that the 2011 RIA likely overestimated total pollution control retrofit

capacity that would occur in response to MATS and, thus, likely overestimated MATS compliance costs. For example, the analysis that follows demonstrates that fabric filter (FF) systems—which are an expensive and capital-intensive control technology—were only installed on less than one-third of the capacity anticipated in the 2011 RIA analysis.

This comparison of projected to observed control capacity installations relies on the simplifying assumption that all dry scrubbers ( e.g., dry FGD systems), dry sorbent injection (DSI) systems, activated carbon injection (ACI) systems, and FF systems installed during the 2013-2016 period were installed for compliance with the MATS emissions limits. This assumption is necessitated by the absence of comprehensive data on the specific reasons EGUs installed pollution control equipment. While assuming pollution controls of these types that were installed in this period are singularly attributable to MATS requirements is a reasonable assumption for this analysis, it is a highly conservative assumption given that some of the observed installations likely occurred in response to other regulations to control criteria air pollutants ( e.g., Cross-State Air Pollution Rule, Regional Haze, Federal implementation plans, or state implementation plans) or enforcement actions ( e.g., consent decrees). Because some of the observed installations in this analysis likely resulted from non-MATS requirements, the approach potentially over-attributes the amount of pollution controls built specifically for MATS compliance, thereby leading to an overestimate of the control costs associated with MATS.

Table 3 presents the findings of this analysis in capacity terms. The total capacity projected to retrofit with each control in the 2011 RIA is reported for the base case ( i.e., projected future conditions absent MATS) and under MATS. The difference is presented in the 'Projected Incremental Controls' column. So, for example, in the 2011 RIA the EPA projected that there would be an incremental 20.3 GW of capacity retrofitting with dry FGD that is attributable to MATS. We compare the projected incremental controls capacity value to the observed installations capacity value. Note that we are unable to estimate the total capacity of observed upgrades to electrostatic precipitators (ESP) and scrubbers due to a lack of available data regarding such upgrades. For additional information, see the docketed Cost TSD.

Table 3—Projected vs. Observed Capacity

Pollution control retrofit	Base case	MATS	Projected incremental controls	Observed installations(2013-2016)	Difference: Observed minus projected(2013-2016)	Percent difference:Observed minus projected(2013-2016)
Dry FGD	4.6	24.8	20.3	16.0	-4.3	-21
DSI	8.6	52.5	43.9	15.8	-28.1	-64
ACI	0	99.3	99.3	96.1	-3.2	-3
FF	12.7	114.7	102	31.4	-70.6	-69
ESP Upgrade	0	33.9	33.9	N/A	N/A	N/A
Scrubber Upgrade	0	63.1	63.1	N/A	N/A	N/A

This analysis demonstrates that projected incremental capacity of dry FGD, DSI, ACI, and FF was likely significantly overestimated in the 2011 RIA. The capacities of actual installed control technologies are lower, often significantly lower, than projected (and again, this analysis attributes *all* control installations of certain types during this time period to MATS, even though some portion of those installations were likely made in whole or in part due

to other regulations). For example, the installed DSI capacity is about two-thirds lower than was projected. The difference between observed installed control capacities and what we projected those incremental control capacities would be translates directly into significantly lower costs than estimated. Because the vast majority of compliance costs in the 2011 RIA were related to the installation and operation of pollution controls, and because significant deployment of any higher-cost compliance strategies did not occur, the large differences observed in Table 3 suggest that the projected compliance costs were likely significantly overestimated as well. For example, approximately \$2 billion was estimated to be attributable to the installation and operation of DSI controls (21 percent of the total annual projected costs of MATS), when in actuality, only one-third of those installations occurred (and some were likely attributable to regulations other than MATS).

We also conduct an analysis of the approximate costs related to the overestimate of projected incremental pollution controls. This analysis is discussed in detail in the Cost TSD. Specifically, we compared observed installations over 2013-2016 to unit-level estimates of the control installation capacity and associated costs presented in the 2011 RIA to develop a range of the potential overestimate of compliance costs related to projected control installations that did not occur.

As result of this analysis, we find that based on this one variable—the number of control technology installations—the 2011 RIA overestimated control costs by about \$2.2 to \$4.4 billion (or 2.7 times). If recent updates to the cost and performance assumptions for pollution controls had been reflected in the 2011 RIA modeling, the projected compliance costs would likely have been even lower (suggesting the overestimate could be greater than \$4.4 billion). The EPA did not quantify advances in cost and performance of control technology between the time of the EPA's modeling and implementation of the rule due to uncertainty. We note that this may be one reason that the Andover Technology Partners' overestimate for control costs of \$7 billion exceeds the EPA's range of overestimates (\$2.2-4.4 billion) for the same control and operation costs. The next section helps explain some of the difference quantified above, and provides further qualitative evidence supporting the EPA's conclusion that the 2011 RIA likely significantly overestimated the compliance costs associated with meeting MATS requirements.

### c. 2011 RIA Modeling Assumptions

Since promulgation of MATS, the EPA has found it necessary to update some of the modeling assumptions used in the IPM modeling that informed the RIA cost estimate, in order to capture the most recently available information and best reflect the current state of the power sector. Several of these recent updates are directly related to pollution control retrofits that were projected to be installed for MATS in the 2011 RIA. Had these updates been reflected in our modeling, it likely would have projected fewer controls needing to be installed and therefore a lower cost estimate overall.

The full suite of assumptions utilized in the IPM modeling are reported in the model documentation, which provides additional information on the assumptions discussed here as well as all other assumptions and inputs to the model. <sup>(92)</sup> Updates specific to MATS modeling are also in the IPM 4.10 Supplemental Documentation for MATS. <sup>(93)</sup> As was included in the 2011 RIA discussion regarding uncertainty and limitations of the power sector modeling analysis (Section 3.15), the cost and emissions impact projections did not take into account the potential for advances in the capabilities of pollution control technologies or reductions in their costs over time. EPA modeling cannot anticipate in advance the full spectrum of compliance strategies that the power sector may innovate to achieve required emission reductions, and experience has shown that regulated industry often is able to comply at lower costs through innovation or efficiencies. Where possible, the EPA designs regulations to assure environmental performance while preserving flexibility for affected sources to design their own solutions for compliance. Industry will employ an array of responses, some of which regulators may not fully anticipate and will generally lead to lower costs associated with the rule than modeled in *ex ante* analysis. See, e.g., section III.D of this preamble, discussing how the actual cost of the ARP was up to 70 percent less than what had been estimated.

A first example regards the assumptions of HCl removal for certain types of coal. When lignite and subbituminous coals are combusted, the chemistry of coal ash alkalinity removes HCl emissions. The 2011 RIA modeling assumed a 75 percent reduction of HCl emissions from lignite and subbituminous coals. <sup>(94)</sup> Upon subsequent review of available data, the EPA updated this assumption to 95 percent HCl removal. <sup>(95)</sup> This revised assumption regarding improved HCl removal from coal ash alkalinity effectively lowers uncontrolled HCl emissions rates in the projections

and is a better reflection of actual removal rates observed by EGUs combusting subbituminous and/or lignite coal. This updated assumption, had it been used in the 2011 RIA modeling, would have significantly decreased the incremental capacity of acid gas controls ( e.g., DSI, dry FGD) that the model projected to be needed for compliance with the MATS acid gas limits. <sup>(96)</sup> The lower projection for controls would in turn have resulted in a lower cost estimate.

For a second example, the EPA updated the DSI retrofit cost methodology used in our power sector modeling. The 2011 RIA compliance cost projections assumed an SO<sub>2</sub> removal rate of 70 percent and a corresponding HCl removal effect of 90 percent <sup>(97)</sup> based on a technical report, developed by Sargent and Lundy in August 2010. <sup>(98)</sup> These assumptions have been updated to reflect an SO<sub>2</sub> removal rate of 50 percent and a corresponding HCl removal effect of 98 percent for units with FF in the EPA's recent modeling, <sup>(99)</sup> based on an updated technical report from Sargent and Lundy. <sup>(100)</sup>

These revised assumptions, which better reflect the actual cost and performance of DSI, would reduce the variable costs significantly, by about one-third at a representative plant, <sup>(101)</sup> because less sorbent is required to achieve the same amount of HCl reduction. If the EPA had been able to use this new information in the 2011 RIA modeling, the projected compliance costs would have been lower, reflecting the reduced sorbent necessary to achieve the MATS emission limits. Furthermore, we note that while these modeling assumptions are based on a single sorbent (trona), alternative sorbents are available, potentially at a lower cost for some units.

A third example relates to the assumed cost of ESP upgrades. In the 2011 RIA modeling, the EPA assumed that a range of upgrades would be necessary at units with existing ESP controls in order to meet the MATS PM standard. The EPA assumed the cost of these upgrades ranged from \$55/kilowatt (kW) to \$100/kW (in 2009 dollars). However, new evidence suggests that many ESP upgrades were installed and are available at less than \$50/kW. <sup>(102)</sup>

These examples highlight the uncertainty inherent in *ex ante* compliance cost projections, and contribute additional evidence that the projected compliance costs presented in the 2011 RIA were likely overestimated and that actual compliance costs for MATS in 2015 were likely significantly less than the \$9.6 billion estimate.

#### d. Conclusion That the 2011 RIA Costs Were Overestimated

After reviewing this suite of quantitative and qualitative updates and considering studies that were performed by outside entities, the EPA concludes that the available *ex post* evidence points to significantly lower costs of compliance for the power sector under MATS than suggested by the *ex ante* projections in the 2011 RIA. There are numerous reasons for this, and chief among them is the fact that the natural gas industry has undergone profound change in recent years. Following the promulgation of MATS, natural gas supply increased substantially, leading to dramatic price decreases that resulted in major shifts in the economics of fossil fuel-fired electric generating technologies. The 2011 RIA modeling did not fully anticipate this historic change in natural gas supply and the related decrease in natural gas prices. As a result of this and other fundamental changes in the industry, we see a very different pattern of control installations than was projected: <sup>(103)</sup>

- 21 percent less capacity of dry FGD than projected;
- 64 percent less capacity of DSI than projected;
- 3 percent less capacity of ACI than projected;
- 69 percent less capacity of FF than projected; and
- Likely fewer ESP and scrubber control upgrades than projected.

These controls were responsible for approximately 70 percent of the projected annual compliance costs in the 2011 RIA. Because so many projected controls were not installed, we know that the control-related costs were almost certainly significantly overestimated. By simply comparing between projected and installed controls, we now find that the projected control-related costs for 2015 of about \$7 billion were likely overestimated by \$2.2 to \$4.4 billion, and possibly more.

In addition, we have updated some of the modeling assumptions that supported the 2011 RIA. Specifically:

- HCl emissions for EGUs burning subbituminous and lignite coals are much lower than originally modeled, reducing the number of controls necessary for compliance in the model;
- DSI controls require less sorbent than originally assumed, lower the operating cost of these controls, and other lower-cost sorbents are likely available; and
- The assumed cost of ESP upgrades in the modeling was likely much higher than the actual cost of these upgrades.

While not quantified here, the advances in cost and performance of control technology between the time of the EPA's modeling and implementation of the rule would, if quantified, likely add to the \$2.2 to \$4.4 billion overestimate.

Furthermore, the three studies submitted to the EPA during earlier rulemakings support this finding that the 2011 RIA cost projection was significantly overestimated:

- Andover Technology Partners estimated that the actual costs of compliance with MATS were approximately \$2 billion, and that the 2011 RIA may have overestimated compliance costs by approximately \$7 billion.
- MJB&A estimated that the total upfront capital expenditures of pollution controls installed for compliance with the rule were overestimated in the 2011 RIA by a factor of more than eight.
- EEI, the association that represents all U.S. investor-owned electric companies, estimated cumulative costs incurred by the industry in response to MATS, and that estimate suggests an annual amount about \$7 billion less than the 2011 RIA projected.

Taken together, this information indicates that the projected costs in the 2011 RIA were almost certainly significantly overestimated. We solicit comment on data resource and methods such as econometric, simulation, and event study approaches that may aid the EPA in better characterizing the *ex post* regulatory costs of MATS for consideration before we issue the final rule.

### 3. Evaluation of Metrics Related to MATS Compliance

In the next four sections, we place the costs that we estimated in 2011, and which, as just explained, were likely significantly overestimated, in the context of the EGU industry and the services the EGU industry provides to society. The purpose of these comparisons is to better understand the disadvantages conferred by expending this money, both in terms of their scale and distribution, in order to weigh cost as a factor in our preferred methodology for making the appropriate determination. While we recognize the projected cost estimate from the 2011 RIA in absolute terms is perceived as a large number, our findings demonstrate that, for example, the (overestimated) projected cost estimate is less than 3 percent of the power sector's revenues from electricity sales, even when compared against data from 2019 (which had the lowest electricity sale revenues in a nearly 20 year period). As we did in 2016, we first contextualize the costs of MATS against power sector data for the years 2000 to 2011, *i.e.*, the information that was available to the Agency when we were promulgating MATS in 2012 and reaffirming the appropriate and necessary determination. For purposes of this proposal, we also expand our assessment to compare the 2011 cost estimates to the most recent years of data available regarding, for example, industry revenue and electricity prices. The intent of expanding the years of analysis is to update our assessments from the 2016 Supplemental Finding considering power sector trends with the newest information. We continue to use projections developed for the 2011 RIA for purposes of these evaluations, because as discussed in section III.B.2, we are unable to generate new, bottom-line actual cost projections. However, in section III.D, we consider these evaluations in light of the EPA's finding that the projected costs were almost certainly significantly overestimated.

#### a. Compliance Costs as a Percent of Power Sector Sales

The first metric examined here (as in 2016) is a comparison of the annual compliance costs of MATS to electricity sales at the power sector-level (*i.e.*, revenues), often called a sales test. The sales test is a frequently used indicator of potential impacts from compliance costs on regulated industries.<sup>(104)</sup> Incorporating updated information from the EIA, Section 2.a and Table A-4 of the Cost TSD present the value of retail electricity sales from 2000 to 2019, as well as net generation totals for the electric power sector for the same period.

This information indicates that the \$9.6 billion in annual compliance costs of MATS projected for 2015 would have represented about 2.7 percent of 2008 power sector revenues from retail electricity sales, the peak year during the 2000 to 2019 period. The \$9.6 billion in projected compliance costs would constitute about 2.9 percent of 2019 sales, which was the lowest sales level observed in the post-2011 period. These projected compliance costs are a very small percentage of total EGU revenues from electricity sales in both robust or lean years, and newer data confirms the findings of the 2016 record. Moreover, if we account for the fact that the \$9.6 billion figure likely significantly overestimated the actual cost of compliance, the percentage of compliance costs to revenues would be even smaller.

#### b. Compliance Expenditures Compared to the Power Sector's Annual Expenditures

The next metrics we examine are a comparison of the annual capital expenditures projected in the 2011 RIA to be needed for MATS compliance to historical power sector-level overall capital expenditures, followed by a comparison of projected annual capital and production expenditures related to MATS compliance to historical power sector-level overall capital and production expenditures.

First, we evaluate capital expenditures. Capital costs represent largely irreversible investments for firms that must be paid off regardless of future economic conditions, as opposed to other important variable costs, such as fuel costs, that may vary according to economic conditions and generation needs. Section 2.b and Table A-5 of the Cost TSD present two sets of estimates for trends in annual capital expenditures by the electric power sector through 2019. The first set of information is based on data compiled by S&P Global, a private sector firm that provides data and analytical services. The second set of information is from the U.S. Census Bureau's Annual Capital Expenditures Survey. While each dataset has limitations, the estimates from each correspond to one another reasonably well.

The 2011 RIA modeling estimated the incremental capital expenditures associated with MATS compliance to be \$4.2 billion for 2015. As discussed in section III.B.2, the 2011 RIA likely significantly overestimated compliance costs. This conclusion also applies to the capital cost component of the overall cost because, as detailed earlier, fewer pollution controls were installed during the 2013-2016 timeframe than were projected in the 2011 RIA. While the EPA is not able to produce an alternative capital cost estimate directly comparable to the estimates from the 2011 RIA, the analysis discussed in section III.B.2 and the Cost TSD indicated the annualized capital expenditures at units that installed controls under MATS might be as low as \$0.7 billion (\$3.5 billion lower than projected in 2011 RIA, or less than one-fifth).

Even using the significantly overestimated figure of \$4.2 billion in our comparison shows that the projected capital expenditures associated with MATS represent a small fraction of the power sector's overall capital expenditures in recent years. Specifically, the \$4.2 billion estimate represents about 3.6 or 3.7 percent of 2019 (*i.e.*, most recent) power sector level capital expenditures based on the S&P Global and U.S. Census information, respectively. Compared against 2004 power sector level capital expenditures (*i.e.*, the 20-year low), the \$4.2 billion figure represents 10.4 or 9.3 percent of sector level capital expenditures (using the two respective data sets). Additionally, the projected \$4.2 billion in incremental capital costs is well within the range of annual variability associated with capital expenditures for the sector over the 2000-2019 period. During this period, based on the Census information, for example, the largest year-to-year decrease in power sector-level capital expenditures was \$19.5 billion (from 2001 to 2002) and the largest year-to-year increase in power sector-level capital expenditures was \$23.4 billion (from 2000 to 2001). This wide range (-\$19.5 to +\$23.4 billion) indicates substantial year-to-year variability in industry capital expenditures, and the projected \$4.2 billion increase in capital expenditures in 2015 projected under MATS falls well within this variability. Similar results are found using the S&P Global information. If a \$4.2 billion increase in capital expenditures in 2015 projected under MATS falls well within the variability of historical trends, then a capital expenditure of less than \$4.2 billion would also fall within this variability.

Next, in order to provide additional perspective to the projected cost information, we look at a broader set of costs faced by industry, including both capital and production expenditures together. Section 2.b and Table A-6 of the Cost TSD present two sets of estimates through 2019 for trends in annual total (capital and production) expenditures by the electric power sector using the same two data sets as above, which we then compare with the projected annual total expenditures required by MATS.

We find that even the overestimated \$9.6 billion compliance cost projection from the 2011 RIA represents a small fraction of the power sector's annual capital and production expenditures compared to historical data, and is well within annual variability in total costs over the 2000 to 2011 and the 2012 to 2019 periods. Compared to 2008 data (i.e., the historic high for total industry expenditures), the projected \$9.6 billion estimate represents about 4.2 to 4.3 percent of total expenditures. The MATS projected compliance cost represents 6.2 to 6.6 percent of total expenditures in 2003 (which was the lowest year for total industry expenditures during the studied time period). Additionally, the EPA notes that, similar to the capital expenditures analysis set forth in the 2015 Proposal, the projected \$9.6 billion in incremental capital plus production costs is well within the range of annual variability in costs in general over the 2000 to 2019 period. For example, during this period, the largest year-to-year decrease in power sector-level capital and production expenditures ranged from \$30.5 billion to \$32.8 billion. The largest year-to-year increase in power sector-level capital and production expenditures in this period ranged from \$27.5 billion to \$28.7 billion. If a \$9.6 billion increase in expenditures falls well within the variability of historical trends, then an expenditure substantially less than \$9.6 billion would also fall within this variability.

### c. Impact on Retail Price of Electricity

We are cognizant that, for an industry like the power sector, costs and disadvantages to regulation are not solely absorbed by regulated sources. Many firms in the industry are assured cost-recovery for expenditures, so there is considerable potential for EGUs to pass through the costs of compliance to consumers via increases in retail electricity prices. This is especially true given that the demand for electricity is not particularly price-responsive. That is, because people are dependent on electricity for daily living, they are not likely to reduce their consumption of electricity even when the price goes up but will instead pay the higher price, thus absorbing the costs of compliance incurred by the industry. Notably, average retail electricity prices have fallen since the promulgation of MATS.

While we analyze these aspects of cost separately, control costs and electricity prices are not separate economic indicators. Electricity price increases are generally related to increases in the capital and operating expenditures by the power sector. Therefore, the electricity price impacts and the associated increase in electricity bills by consumers are not costs that are additional to the compliance costs described earlier in this section. In fact, to the extent the compliance costs are passed on to electricity consumers, the costs to the EGU owners in the power sector are reduced. Therefore, in order to further assess the disadvantages to regulation, in this case to consumers of electricity in all sectors (residential, commercial, industrial, transportation, and other sectors), we evaluate as we did in 2016 the projected effect MATS was anticipated to have on retail electricity prices, as measured against the variations in electricity prices from year to year. For this proposal, we expanded that analysis using updated data from the EIA, as presented in section 2.c and Table A-7 of the Cost TSD.

Looking at 2000-2019 data, we find that the projected 0.3 cents per kilowatt-hour projected increase in national average retail electricity price under MATS is well within the range of annual variability over the 2000-2019 period. During that time period, the largest year-to-year decrease in national average retail electricity price was -0.2 cents per kilowatt-hour (from 2001 to 2002) and the largest year-to-year increase was 0.5 cents per kilowatt-hour (from 2005 to 2006). For the newer data analyzed, we also found that average retail electricity prices have generally decreased since 2011, from 9.33 cents per kilowatt-hour in 2011 to 8.68 cents per kilowatt-hour in 2019, or by nearly 7 percent.

After considering the potential impacts of MATS on retail electricity prices, the EPA concludes that the projected increase in electricity prices is within the historical range. In addition, any increase in electricity prices would not be additive to the overall compliance costs of MATS. Rather, such price impacts would in part reflect the ability of many EGUs to pass their costs on to consumers, thereby reducing the share of MATS compliance costs borne by owners of EGUs. Given the relationship between compliance costs and electricity prices, we would also therefore expect the significant overestimate of compliance costs reflected in the \$9.6 billion figure to translate into overestimates in our projections for electricity price increases. Therefore, incorporating this newer data into our analysis, we find that MATS did not result in increases in electricity prices for American consumers that were outside the range of normal year-to-year variability, and during the period when MATS was implemented, electricity prices generally decreased.

#### d. Impact on Power Sector Generating Capacity

We recognize that the power sector plays a role of critical importance to the American public. A potential disadvantage to regulation that we consider to be a relevant factor in our consideration under CAA section 112(n)(1)(A) is how such regulation would impact the provision of adequate and reliable electricity throughout the country. <sup>(105)</sup> Therefore, we analyzed, as part of the 2012 record, projected net changes in generation capacity under MATS, as compared to the base case, that is, what expected generation capacity would have been absent the rule. <sup>(106)</sup> We also conducted an analysis of the impacts of projected retirements on electric reliability. *Id.* And finally, in parallel with finalizing MATS, the EPA's Office of Enforcement and Compliance Assurance issued a policy memorandum describing an approach for units that were reliability critical that could demonstrate a need to operate in noncompliance with MATS for up to a year. <sup>(107)</sup>

Our analysis indicated that the vast majority of the generation capacity in the power sector directly affected by the requirements of MATS would remain operational following MATS. Specifically, our model projected that operational capacity with MATS in place would be reduced by less than 1 percent nationwide. See Resource Adequacy and Reliability TSD at 2. With respect to reliability, our modeling indicated that coal retirements would be distributed throughout the power grid, and that there would only be small impacts at the regional level, and that in those regions, we anticipated small decreases in overall adequacy of resources and robust remaining reserve margins. *Id.* These analyses therefore found that the power sector would be able to continue to provide adequate and reliable electricity even with regulation of the EGU sector for HAP.

Additionally, since MATS was promulgated, the EPA has not been made aware of reliability or resource adequacy problems attributable to MATS. As noted, the EPA's enforcement office concurrently issued a policy memorandum to work with sources that faced demonstrated reliability concerns, and five administrative orders were issued in connection with the policy. <sup>(108)</sup> We think this small number of sources obtaining relief due to their reliability critical status provides some confirmation of the EPA's projections that regulation would not cause widespread resource and reliability problems.

#### 4. Other Cost Considerations

We also propose to reaffirm our previous findings regarding the costs of mercury controls, consistent with the instruction from the statute to study the availability and cost of such controls in CAA section 112(n)(1)(B). 80 FR 75036-37 (December 1, 2015). We similarly propose to reaffirm our previous records and findings regarding the cost of controls for other HAP emissions from EGUs, and the cost of implementing the utility-specific ARP, which Congress wrote into the 1990 CAA Amendments and implementation of which Congress anticipated could result in reductions in HAP emissions. *Id.* With respect to the costs of technology for control of mercury and non-mercury HAP, the record evidence shows that in 2012 controls were available and routinely used and that control costs had declined considerably over time. *Id.* at 75037-38. With regard to the ARP, industry largely complied with that rule by switching to lower-sulfur coal, and subsequently the actual costs of compliance were substantially lower than projected. Though the reasons for discrepancies between projected and actual costs are different for MATS, as discussed in section III.B.2, the newer information examined as part of this proposal demonstrates that the projected cost estimates for MATS were also likely significantly overestimated.

#### 5. Summary of Consideration of Cost of Regulating EGUs for HAP

In this section, the EPA noted several studies performed by outside entities suggesting that costs of MATS may have been overestimated in the 2011 RIA. We discussed the dramatic impacts to the power sector over the last 10 years due to increasing supplies and decreasing price of natural gas and renewables, and we conducted a suite of quantitative and qualitative updates to the information available in the 2011 RIA. Based on this information, we propose to conclude that the available *ex post* evidence points to a power sector that incurred significantly lower costs of compliance obligations under MATS than anticipated based on the *ex ante* projections when the rule was finalized in 2012. This overestimate was significant—for just one part of the original compliance cost estimate, the EPA was able to quantify a range of at least \$2.2 to \$4.4 billion in projected costs related to the installation, operation, and maintenance of controls which were not expended by industry. This projected overestimation is limited to these costs; it does not account for other ways in which the rule's costs were likely overestimated, such

as advances in control technologies that made control applications less expensive or more efficient at reducing emissions. The other studies conducted by stakeholders asserted there were even greater differences between projected and actual costs of MATS.

We next examined the 2011 projected costs, which were almost certainly significantly overestimated, in the context of the EGU industry and the services the EGU industry provides to society. The purpose of these comparisons was to better understand the disadvantages imposed by these costs, in order to weigh cost as a factor in our preferred methodology for making the appropriate determination. Even though the cost estimates we used in this analysis were almost certainly significantly overestimated, we noted they were relatively small when placed in the context of the industry's revenues and expenditures, and well within historical variations.

Based on the 2011 RIA, the total projected cost of the MATS rule to the power sector in 2015 represented between 2.7 and 3.0 percent of annual electricity sales when compared to years from 2000 to 2019, a small fraction of the value of overall sales (and even smaller when one takes into account that the 2011 RIA projections were likely significantly overestimated). Looking at capital expenditures, the EPA demonstrated that the projected MATS capital expenditures in 2015 represented between 3.6 and 10.4 percent of total annual power sector capital expenditures when compared to years surrounding the finalization of the MATS rule. Such an investment by the power sector would comprise a small percentage of the sector's historical annual capital expenditures on an absolute basis and also would fall within the range of historical variability in such capital expenditures. Similarly, the EPA demonstrated that the projected capital and operating expenditures in 2015 represented between 4.3 and 6.2 percent of total annual power sector capital and operating expenditures over 2000 to 2019, and is well within the substantial range of annual variability. This proposal's analysis indicating that the far fewer controls were installed than the EPA had projected would be required is particularly relevant to considering our findings as to this metric; with the overestimation of capital expenditures in mind, actual investments by the power sector to comply with MATS would have comprised an even smaller percentage of historical annual capital expenditures.

With respect to impacts on the wider American public, the EPA examined impacts on average retail electricity prices and found the modest increases—which, like overall compliance costs, are also likely to have been significantly overestimated—to be within the range of historical variability. Experience has also shown that national average retail electricity prices in years after MATS promulgation have declined. Finally, previous analysis indicated that the vast majority of the generation capacity in the power sector would remain operational and that the power sector would be able to continue to provide adequate and reliable electricity after implementation of the rule, and we have seen no evidence to contradict those findings.

The EPA proposes that each of these analyses are appropriate bases for evaluating the disadvantages to society conferred by the MATS-related projected compliance expenditures. As we note above, even though the projected costs we use in this analysis are almost certainly significantly overestimated, we find that they are still relatively small when placed in the context of the economics of the industry, and well within historical variations. We solicit comments on all aspects of this proposed consideration of costs.

### C. Revocation of the 2020 Final Action

We are proposing to revoke the 2020 Final Action because we find that the framework used to consider cost in 2020, which centered the Agency's mandated determination under CAA section 112(n)(1)(A) on a comparison of costs to monetized HAP benefits, was an approach ill-suited to making the appropriate and necessary determination in the context of CAA section 112(n)(1)(A) specifically and the CAA section 112 program generally. Moreover, the statutory text and legislative history do not support a conclusion that the 2020 framework is required under CAA section 112(n)(1)(A), and we exercise our discretion to adopt a different approach. We also disagree with the conclusions presented in the 2020 Final Action as to the 2016 Supplemental Finding's two approaches.

The 2020 Final Action established the following framework for making the appropriate and necessary determination. It stated:

“The Administrator has concluded that the following procedure provides the appropriate method under which the EPA should proceed to determine whether it is appropriate and necessary to regulate EGUs under CAA section 112(n)(1)(A). First, the EPA compares the monetized costs of regulation against the subset of HAP benefits that

could be monetized. . . . Second, the EPA considers whether unquantified HAP benefits may alter that outcome. . . . Third, the EPA considers whether it is appropriate, notwithstanding the above, to determine that it is “appropriate and necessary” to regulate EGUs under CAA section 112(n)(1)(A) out of consideration for the PM co-benefits that result from such regulation.” 85 FR 31302 (May 22, 2020).

Applying the first part of the framework, the Agency noted that the costs of regulation estimated in the 2011 RIA were disproportionately higher—by three orders of magnitude—than the monetized HAP benefits, and concluded “[t]hat does not demonstrate ‘appropriate and necessary.’” *Id.* Under the framework’s second inquiry, the EPA determined that the unquantified HAP benefits, even if monetized, were unlikely to alter its conclusion under the first part of the framework. *Id.*; see also 85 FR 31304 (noting that “valuing HAP-related morbidity outcomes would not likely result in estimated economic values similar to those attributed to avoiding premature deaths”). Finally, applying the third part of its framework, the EPA noted that nearly all of the monetized benefits of MATS as reflected in the 2011 RIA were derived from PM benefits. See 85 FR 31302-03 (May 22, 2020). The EPA then posited that, “[h]ad the HAP-specific benefits of MATS been closer to the costs of regulation, a different question might have arisen as to whether the Administrator could find that co-benefits legally form part of the justification for determination that regulation of EGUs under CAA section 112(d) is appropriate and necessary.” See 85 FR 31303 (May 22, 2020). However, because of the factual scenario presented in the record, the Agency in the 2020 Final Action stated that “[t]he EPA does not need to, and does not, determine whether that additional step would be appropriate . . . given that the monetized and unquantified HAP-specific benefits do not come close to a level that would support the prior determination.” *Id.* In conclusion, the EPA stated that “[u]nder the interpretation of CAA section 112(n)(1)(A) that the EPA adopts in this action, HAP benefits, as compared to costs, must be the primary question in making the ‘appropriate and necessary’ determination.” *Id.*

We note that the three-step framework employed by the 2020 Final Action is not a BCA conforming to recognized principles ( see, e.g., OMB Circular A-4, EPA Economic Guidelines). BCA is a specific tool developed by economists to assess total society-wide benefits and costs, to determine the economic efficiency of a given action. Instead of conforming to this comprehensive approach, the three-step framework focused primarily on comparing the rule’s total costs to a very small subset of HAP benefits that could be monetized. The Agency gave secondary weight to the vast majority of the benefits of regulating HAP emissions from stationary sources that cannot be quantified, and completely ignored the non-HAP monetized benefits directly attributable to the MATS rule.

We propose to find that this three-step framework is an unsuitable approach to making the appropriate and necessary determination under CAA section 112(n)(1)(A) because it places undue primacy on those HAP benefits that have been monetized, and fails to consider critical aspects of the inquiry posed to the EPA by Congress in CAA section 112(n)(1). The 2020 three-step framework also did not in any meaningful way grapple with the bases upon which the EPA had relied to design the 2016 preferred approach, as discussed above, including the broad statutory purpose of CAA section 112 to reduce the volume of HAP emissions with the goal of reducing the risk from HAP emissions to a level that is protective of even the most exposed and most sensitive subpopulations; the fact that we rarely can fully characterize or quantify risks, much less benefits, at a nationwide level; and the fact that except for one of the many health endpoints for only one of the many HAP emitted from EGUs, the EPA lacked the information necessary to monetize any post-control benefit of reductions in HAP emissions. The sole rationale provided in the 2020 Final Action for rejecting the relevance of the statute’s clear purpose as evinced in the broader CAA section 112 program and reflected in the provisions of CAA section 112(n)(1) was that CAA section 112(n)(1)(A) is a separate provision and threshold determination. See 85 FR 31293-94 (May 22, 2020). But we do not think it is sensible to view the statute’s direction to the EPA to make a separate determination as to EGUs as an invitation to disregard the statutory factors of CAA section 112(n)(1) and the greater statutory context in which that determination exists, and we do not think that the 2020 Final Action provided an adequately reasoned basis for abandoning the interpretation and assessment provided in the 2016 Supplemental Finding. And in any event, we believe the methodology we propose today is better suited to making the statutory finding than the 2020 framework.

In the 2020 rulemaking, the EPA did not explain its rationale for its decision to anchor the appropriate and necessary determination at step one as a comparison between the monetized costs of regulation and *monetized* HAP specific benefits. Rather, the proposed and final rules repeatedly state that the “primary” inquiry in the determination should be a comparison of costs and HAP benefits, but did not explain why only *monetized* HAP

benefits should be given primacy. See, e.g., 85 FR 31286, 31288, 31303 (May 22, 2020). Given the Agency's recognition of the broad grant of discretion inherent in the phrase "appropriate and necessary," see 81 FR 24430-31 (April 25, 2016), its acknowledgement of Congress' "particularized focus on reducing HAP emissions and addressing public health and environmental risks from those emissions" in CAA section 112, see 85 FR 31299 (May 22, 2020), and its knowledge and recognition that the dollar value of one of its points of comparison represented but a small subset of the advantages of regulation, see 85 FR 31302 (May 22, 2020), we now believe it was inappropriate to adopt a framework that first and foremost compared dollar value to dollar value. Nothing in the CAA required the Agency's decision in 2020 to hinge its framework on monetized HAP benefits. The consideration of the non-monetized benefits of MATS (*i.e.*, dozens of endpoints, including virtually all of the HAP benefits associated with this rule) occurred only at step two, where the Agency considered whether the unquantified benefits, if monetized, were "likely to overcome the imbalance between the monetized HAP benefits and compliance costs in the record." See 85 FR 31296 (May 22, 2020). This approach discounts the vast array of adverse health and environmental impacts associated with HAP emissions from coal- and oil-fired EGUs that have been enumerated by the EPA <sup>(109)</sup> and discounts the social value (benefit) of avoiding those impacts through regulation, simply because the Agency cannot assign a dollar value to those impacts. Further, the three-step framework gave no consideration to the important statutory objective of protecting the most at-risk subpopulations. As noted above, in CAA section 112(n)(1)(C) Congress directed the EPA to establish threshold levels of exposure under which no adverse effect to human health would be expected to occur, even considering exposures of sensitive populations, and throughout CAA section 112, Congress placed special emphasis on regulating HAP from sources to levels that would be protective of those individuals most exposed to HAP emissions and most sensitive to those exposures. The rigid and narrow approach to making the appropriate and necessary determination in the 2020 Final Action is at odds with the text and purpose of CAA section 112, and is certainly not required under the express terms of CAA section 112 or CAA section 112(n)(1)(A).

Commenters on the 2019 Proposal objected strenuously to the Agency's revised framework for making the appropriate and necessary determination, arguing that the 2019 Proposal's interpretation "fails to meaningfully address factors that are 'centrally relevant' to the inquiry of whether it is appropriate and necessary to regulate HAP from EGUs," and that the Agency's new interpretation must fall because the EPA failed to provide a reasoned explanation for its change in policy, as required by *Motor Vehicle Mfrs. Ass'n of United States, Inc. v. State Farm Mut. Automobile Ins. Co.*, 463 U.S. 29 (1983), and *FCC v. Fox Television Stations, Inc.*, 556 U.S. 502 (2009). See 85 FR 31294 (May 22, 2020). Among the factors that commenters argued had been inadequately addressed under the new framework were the "hazards to public health reasonably anticipated to occur" that had not been monetized; the non-monetizable benefits of HAP regulation such as preservation of tribal social practices; the latency, persistence in the environment, and toxicity of HAP as recognized by Congress; and the distributional impacts on particular communities and individuals most impacted by HAP emitted from power plants. In responses to these comments, the EPA claimed that it was not "disregarding" or "dismissing" the concerns raised by the commenters, but rather simply weighing them differently, and explained that the Administration's changed priorities provided the "reasoned basis" for its changed interpretation. See 85 FR 31296-97 (May 22, 2020).

Agencies do have broad discretion to re-evaluate policies and change their "view of what is in the public interest," *State Farm*, 463 U.S. at 57, but such re-evaluations must still adhere to principles of reasoned decision-making. The 2020 Final Action did not aver that the concerns identified by commenters were factors that the statute does not instruct the Agency to consider in making its appropriate and necessary determination. Instead, the EPA stated that it was permitted to pick its decisional framework and admitted that its decisional framework might undervalue certain factors. For example, with respect to commenters' concerns that the revised appropriate and necessary framework did not adequately account for adverse impacts on tribal culture or undue concentration of public health risks on certain population subgroups or individuals, the EPA stated,

"In a cost-benefit comparison, the overall amount of the benefits stays the same no matter what the distribution of those benefits is. The EPA, therefore, believes it is reasonable to conclude that those factors to which the EPA previously gave significant weight-including qualitative benefits, and distributional concerns and impacts on minorities-will not be given the same weight in a comparison of benefits and costs for this action under CAA section 112(n)(1)(A)." 85 FR 31297 (May 22, 2020).

The decisional framework in the 2020 Final Action, however, did not give “less weight” to these factors—it gave them none. In both the selection and application of its framework, the EPA in the 2020 Final Action effectively ignored these factors altogether, and we do not agree that the inability to monetize a factor should render it unimportant. *Cf. Am. Trucking Ass'ns, Inc. v. EPA*, 175 F.3d 1027, 1052-53 (D.C. Cir. 1999), reversed in part on other grounds in *Whitman v. Am. Trucking Ass'ns*, 531 U.S. 457 (2001) (holding that the EPA was not permitted to ignore information “because the . . . benefits are difficult, if not impossible, to quantify reliably and because there is ‘no convincing basis for concluding that any such effects . . . would be significant’ ”); *Pub. Citizen v. Fed. Motor Carrier Safety Admin.*, 374 F.3d 1209, 1219 (D.C. Cir. 2004) (“The mere fact that the magnitude of . . . effects is *uncertain* is no justification for *disregarding* the effect entirely.”) (emphasis in original). The mere mention and summary dismissal of factors does not constitute meaningful consideration of those factors.

In the 2020 Final Action, like the 2016 Supplemental Finding before it, the EPA maintained that there is more than one permissible way to interpret the Agency's obligation to consider cost in the appropriate and necessary determination. Given the Agency's knowledge of the significant risks and often irreversible impacts of HAP exposure on vulnerable populations like developing fetuses, the disproportionate impact of EGU HAP emissions on communities who subsist on freshwater fish due to cultural practices and/or economic necessity, and the record of data demonstrating risks to public health amassed over decades, and, perhaps more importantly, the overwhelming quantity of advantages to regulation that could not be monetized, we do not think that selecting a framework that compared first and foremost monetized HAP benefits with costs was appropriate. And even if the framework ultimately addressed the statutorily relevant factors because at the second step the EPA stated that it was considering non-monetized HAP benefits, we think that the application of that second step fell short. The secondary consideration of non-monetized HAP benefits in the three-step framework only considered post-control HAP-related impacts of regulation insofar as the EPA speculated about what the monetized value of those benefits might be ( see 85 FR 31296 (May 22, 2020), asserting that monetized value of avoiding morbidity effects such as neurobehavioral impacts is “small” compared to monetized value associated with avoided deaths). The Agency did not, at this second step, grapple with the existing risk analyses, including those stemming from the statutorily mandated studies in CAA section 112(n)(1). Those analyses demonstrated substantial public health and environmental hazards, even if the hazards were not translated into post-control monetized benefits. See *White Stallion*, 748 F.3d at 1245. The Agency also did not explain why other attributes of risk—such as impacts on vulnerable populations and the reality that HAP pollution from EGUs is not distributed equally across the population but disproportionately impacts some individuals and communities far more than others—were unimportant, stating only that the selected framework did not accommodate consideration of those factors.

As noted, the Agency did not point to anything in the CAA as supporting the use of its three-step framework. This is in stark contrast to the 2016 Supplemental Finding rulemaking, in which the EPA examined CAA section 112(n)(1) (A) and the other section 112(n)(1) provisions, and the rest of CAA section 112 generally, and D.C. Circuit case law on CAA cost considerations to inform the EPA's interpretation of CAA section 112(n)(1)(A). See 80 FR 75030 (December 1, 2015); 2015 Legal Memorandum. In the 2020 Final Action, the EPA merely asserted that a comparison of benefits to costs is “a traditional and commonplace way to assess costs” and claimed that the Supreme Court's holding in *Entergy Corp. v. Riverkeeper*, 556 U.S. 208 (2009) supported the EPA's 2020 position that, absent an unambiguous prohibition to use a BCA, an agency may generally rely on a BCA as a reasonable way to consider cost. See 85 FR 31293 (May 22, 2020). The 2020 Final Action also pointed out “many references comparing” costs and benefits from the *Michigan* decision, including: “EPA refused to consider whether the costs of its decision outweighed the benefits” (576 U.S. at 743); “[o]ne would not say that it is rational, never mind ‘appropriate,’ to impose billions of dollars in economic costs in return for a few dollars in health or environmental benefits” ( *Id.* at 752); and “[n]o regulation is ‘appropriate’ if it does more harm than good” ( *Id.* ).

But while we agree that a comparison of benefits to costs is a traditional way to assess costs, the 2020 framework was *not* a BCA. There is no economic theory or guidance of which we are aware that endorses the version of BCA presented in the 2020 Final Action, in which total costs are compared against a small subset of total benefits. See section III.E for further discussion. Moreover, general support for weighing costs and benefits does not justify placing undue weight on monetized HAP benefits, with secondary consideration for all other benefits, and only valuing those other benefits to the extent of their speculative monetized effects. As noted in Justice Breyer's

concurrence in *Entergy Corp.*, the EPA has the ability “to describe environmental benefits in non-monetized terms and to evaluate both costs and benefits in accordance with its expert judgment and scientific knowledge,” and to engage in this balancing outside of “formal cost- benefit proceedings and futile attempts at comprehensive monetization.” 556 U.S. at 235 (Breyer, J., concurring). Benefits—the advantages of regulation—can encompass outcomes that are not or cannot be expressed in terms of dollars and cents, just as the Court found that “ ‘cost’ includes more than the expense of complying with regulations; any disadvantage could be termed a cost.” *Michigan*, 576 U.S. at 752. And the Court faulted the EPA’s interpretation for “preclud[ing] the Agency from considering *any* type of cost—including, for instance, harms that regulation might do to human health or the environment. . . . No regulation is ‘appropriate’ if it does significantly more harm than good.” *Id.* The constricted view of benefits that the Agency adopted in 2020 was ill-suited to the statutory inquiry as interpreted in *Michigan*.

The primary basis in the 2020 action upon which the EPA relied to find that the 2016 preferred approach was flawed was that the preferred approach failed to “satisf[y] the Agency’s obligation under CAA section 112(n)(1)(A) as interpreted by the Supreme Court in *Michigan*.” See 84 FR 2674 (February 7, 2019). The 2019 Proposal claimed that the chief flaw of the preferred approach was the Agency’s failure to “meaningfully consider cost within the context of a regulation’s benefits,” asserting that the *Michigan* Court contemplated that a proper consideration of cost would be relative to benefits. See 84 FR 2675 (February 7, 2019). But that is not an accurate characterization of the 2016 preferred approach, wherein the Agency weighed the existing record from 2012 demonstrating that HAP emissions from EGUs pose a number of identified hazards to both public health and the environment remaining after imposition of the ARP and other CAA requirements against the cost of MATS. See 81 FR 24420 (April 25, 2016) (“After evaluating cost reasonableness using several different metrics, the Administrator has, in accordance with her statutory duty under CAA section 112(n)(1)(A), weighed cost against the previously identified advantages of regulating HAP emissions from EGUs—including the agency’s prior conclusions about the significant hazards to public health and the environment associated with such emissions and the volume of HAP that would be reduced by regulation of EGUs under CAA section 112.”). The 2020 Final Action further stated that the preferred approach was an “unreasonable” interpretation of CAA section 112(n)(1)(A) and impermissibly de-emphasized the importance of the cost consideration in the appropriate and necessary determination. See 85 FR 31292 (May 22, 2020). It is a decisional framework which rests primarily upon a comparison of the costs of a regulation and the small subset of HAP benefits which could be monetized that does not “meaningfully consider[s] cost within the context of a regulation’s benefits,” because such a narrow approach relegates as secondary (and in application appeared to ignore altogether) the vast majority of that rule’s HAP benefits and other advantages. We therefore propose to revoke the 2020 three-step approach and determination because we do not think it is a suitable way to assess the advantages and disadvantages of regulation under CAA section 112(n)(1)(A) and in applying it, the Agency failed to meaningfully address key facts in the existing record. Even if the Agency’s selection of the 2020 framework could be considered a permissible interpretation of the broad “appropriate and necessary” determination in CAA section 112(n)(1)(A), we exercise our discretion under the statute and as described in *Michigan*, to approach the determination differently.

#### D. The Administrator’s Proposed Preferred Framework and Proposed Conclusion

The EPA is proposing a preferred, totality-of-the-circumstances approach as a reasonable way to “pay attention to the advantages *and* disadvantages of [our] decision,” *Michigan*, 576 U.S. at 753, in determining whether it is appropriate to regulate coal- and oil-fired EGUs under section 112 of the CAA. This approach, including which factors we consider and how much weight we give them, is informed by Congress’ design of CAA section 112(n)(1) specifically, and CAA section 112 generally.

Specifically, under this approach we first consider and weigh the advantages of reducing EGU HAP via regulation. We focus on the public health advantages of reducing HAP emissions because in CAA section 112(n)(1)(A), Congress specifically directed the EPA to regulate EGUs under CAA section 112 after considering the results of the “study of hazards to public health reasonably anticipated to occur as a result of emissions” by EGUs. We also consider the other studies commissioned by Congress in CAA sections 112(n)(1)(B) and (C) and the types of information the statute directed the EPA to examine under those provisions—the rate and mass of EGU mercury emissions, the health and environmental effects of such emissions, and the threshold level of mercury concentrations in fish tissue which may be consumed (even by sensitive populations) without adverse effects to

public health. <sup>(110)</sup> We place considerable weight on the factors addressed in the studies required in the other provisions of CAA section 112(n)(1) because that provision is titled “Electric utility steam generating units,” so it is reasonable to conclude that the information in those studies is important and relevant to a determination of whether HAP emissions from EGUs should be regulated under CAA section 112. <sup>111</sup> See *Michigan*, 576 U.S. at 753-54 (citing CAA sections 112(n)(1)(B) and (C), its caption, and the additional studies required under those subparagraphs as relevant statutory context for the appropriate and necessary determination).

Notably, the studies of CAA section 112(n)(1) place importance on the same considerations that are expressed in the terms and overall structure of CAA section 112. For example, CAA section 112(n)(1)(A) and section 112(n)(1)(B) both show interest in the amount of HAP emissions from EGUs—section 112(n)(1)(A) by requiring the EPA to estimate the risk remaining after imposition of the ARP and other CAA requirements and section 112(n)(1)(B) by requiring the EPA to study the rate and mass of mercury emissions; therefore, we believe it is reasonable to conclude that we should consider and weigh the volume of toxic pollution EGUs contributed to our air, water, and land absent regulation under CAA section 112, in total and relative to other domestic anthropogenic sources, and the potential to reduce that pollution, thus reducing its grave harms. In addition, the clear goal in CAA section 112(n)(1)(C) and elsewhere to consider risks to the most exposed and susceptible populations supports our decision to place significant weight on reducing the risks of HAP emissions from EGUs to the most sensitive members of the population ( e.g., developing fetuses and children), and communities that are reliant on self-caught local fish for their survival. Finally, we also consider the identified risks to the environment posed by mercury and acid-gas HAP, consistent with CAA section 112(n)(1)(B) and the general goal of CAA section 112 to address adverse environmental effects posed by HAP emissions. See CAA section 112(a)(7) (defining “adverse environmental effect”).

We next examine the disadvantages of regulation, principally in the form of the costs incurred to capture HAP before they enter the environment. As with the advantages side of the equation, where we consider the consequences of reducing HAP emissions to human health and the environment, we consider the consequences of these expenditures for the electricity generating sector and society. We therefore consider compliance costs comprehensively, placing them in the context of the effect those expenditures have on the economics of power generation more broadly, the reliability of electricity, and the cost of electricity to consumers. These metrics are relevant to our weighing exercise because they give us a more complete picture of the disadvantages to society imposed by this regulation, and because our conclusion might change depending on how this burden affects the ability of the industry to thrive and provide reliable, affordable electricity to the benefit of all Americans. Consistent with CAA section 112(n)(1)(B), we further consider relevant control costs for EGUs and the relationship of control costs expected and experienced under the ARP and MATS.

Below, consistent with this framework, we consider and weigh the advantages to regulation against the costs of doing so, giving particular weight to our examination of the public health hazards we reasonably anticipate to occur as a result of HAP emissions from EGUs, and the risks posed by those emissions to exposed and vulnerable populations. We note as well that had we found regulation under CAA section 112 to impose significant barriers to provision of affordable and reliable electricity to the American public, this would have weighed heavily in our decision.

We acknowledge, as we recognized in the 2016 preferred approach, that this approach to making the appropriate and necessary determination is an exercise in judgment, and that “[r]easonable people, and different decision-makers, can arrive at different conclusions under the same statutory provision,” (81 FR 24431; April 25, 2016), but this type of weighing of factors and circumstances is an inherent part of regulatory decision-making. As noted in then-Judge Kavanaugh's dissent in *White Stallion*, “All regulations involve tradeoffs, and . . . Congress has assigned EPA, not the courts, to make many discretionary calls to protect both our country's environment and its productive capacity.” 748 F.3d at 1266 (noting as well that “if EPA had decided, in an exercise of its judgment, that it was ‘appropriate’ to regulate electric utilities under the MACT program because the benefits outweigh the costs, that decision would be reviewed under a deferential arbitrary and capricious standard of review”). Bright-line tests and thresholds are not required under the CAA's instruction to determine whether regulation is “appropriate and necessary,” nor have courts interpreted broad provisions similar to CAA section 112(n)(1)(A) in such manner. In

*Catawba Cty. v. EPA*, the D.C. Circuit held that “[a]n agency is free to adopt a totality-of-the-circumstances test to implement a statute that confers broad authority, even if that test lacks a definite ‘threshold’ or ‘clear line of demarcation to define an open-ended term.’” 571 F.3d 20, 37 (D.C. Cir. 2009).

In undertaking this analysis, we are cognizant that, while the Agency has been studying the science underlying this determination for decades, the understanding of risks, health, and environmental impacts associated with toxic air pollution continues to evolve. In this notice, we explained the additional information that has become available to the Agency since we performed our national risk assessments, and explained why, despite the certainty of the science demonstrating substantial health risks, we are unable at this time to quantify or monetize many of the effects associated with reducing HAP emissions from EGUs. <sup>(112)</sup> We continue to think it is appropriate to give substantial weight to these public health impacts, even where we lack information to precisely quantify or monetize those impacts. As the D.C. Circuit stated in *Ethyl Corp. v. EPA*,

“Where a statute is precautionary in nature, the evidence difficult to come by, uncertain, or conflicting because it is on the frontiers of scientific knowledge, the regulations designed to protect public health, and the decision that of an expert administrator, we will not demand rigorous step-by-step proof of cause and effect. . . . [I]n such cases, the Administrator may assess risks. . . . The Administrator may apply his expertise to draw conclusions from suspected, but not completely substantiated, relationships between facts, from trends among facts, from theoretical projections from imperfect data, from probative preliminary data not yet certifiable as ‘fact,’ and the like.”

541 F.2d 1, 28 (D.C. Cir. 1976). See also *Lead Industries Ass’n v. EPA*, 647 F.2d 1130, 1155 (D.C. Cir. 1980) (“[R]equiring EPA to wait until it can conclusively demonstrate that a particular effect is adverse to health before it acts is inconsistent with both the [Clean Air] Act’s precautionary and preventive orientation and the nature of the Administrator’s statutory responsibilities.”).

The EPA is not alone in needing to make difficult judgments about whether a regulation that has a substantial economic impact is “worth it,” in the face of uncertainty such as when the advantages of the regulation are hard to quantify in monetary terms. The Transportation Security Administration (TSA), when determining whether to require Advanced Imaging Technology at certain domestic airports, faced assertions that the high cost of widespread deployment of this type of screening was “not worth the cost.” TSA acknowledged that it did not “provide monetized benefits” or “degree of benefits” to justify the use of the screening, but noted that the agency “uses a risk-based approach . . . in order to try to minimize risk to commercial air travel.” See 81 FR 11364, 11394 (March 3, 2016). The agency pointed out that it could not consider “only the most easily quantifiable impacts of a terrorist attack, such as the direct cost of an airplane crashing,” but rather that it had an obligation to “pursue the most effective security measures reasonably available so that the vulnerability of commercial air travel to terrorist attacks is reduced,” noting that some commenters were failing to consider the more difficult to quantify aspects of the benefits of avoiding terrorist attacks, such as “substantial indirect effects and social costs (such as fear) that are harder to measure but which must also be considered by TSA when deciding whether an investment in security is cost-beneficial.” *Id.*

In reviewing Agency decisions like these, courts do “not to substitute [their] judgment[s] for that of the agenc[ies],” *State Farm*, 463 U.S. at 43 (1983), and “[t]his is especially true when the agency is called upon to weigh the costs and benefits of alternative policies,” *Center for Auto Safety v. Peck*, 751 F.2d 1336, 1342 (D.C. Cir. 1985). See also *v. FCC*, 707 F.2d 1413, 1440 (D.C. Cir. 1983) (“[C]ost benefit analyses epitomize the types of decisions that are most appropriately entrusted to the expertise of an agency.”). Agencies are entitled to this deference even where, or perhaps particularly where, costs or benefits can be difficult to quantify. For example, in *Consumer Elecs. Ass’n v. FCC*, the D.C. Circuit upheld the FCC’s mandate to require digital tuners, finding reasonable the Commission’s identification of benefits, that is, “principally speeding the congressionally-mandated conversion to DTV and reclaiming the analog spectrum,” coupled with the FCC’s “adequate[] estimate[] of the long-range costs of the digital tuner mandate within a range sufficient for the task at hand . . . and [its finding of] the estimated costs to consumers to be ‘within an acceptable range.’” 347 F.3d 291, 303-04 (D.C. Cir. 2003) (“We will not here second-guess the Commission’s weighing of costs and benefits.”).

Similarly, the Food and Drug Administration, in weighing the costs and benefits of deeming electronic cigarettes to be “tobacco products,” described the benefits qualitatively, “ ‘potentially coming from’ . . . premarket review [ *i.e.*, the statutory consequence of deeming], which will result in fewer harmful or additive products from reaching the market than would be the case in the absence of the rule; youth access restrictions and prohibitions on free samples, which can be expected to constrain youth access to tobacco products and curb rising uptake; health warning statements, which will help consumers understand and appreciate the risks of using tobacco products; prohibitions against false or misleading claims and unsubstantiated modified risk claims; and other changes [such as monitoring and ingredient listings].” *Nicopure Labs, LLC v. FDA*, 266 F. Supp. 3d 360, 403-404 (D.D.C. 2017), *aff’d*, 944 F.3d 267 (D.C. Cir. 2019). Plaintiffs challenging the rule claimed that because the FDA had not quantified the benefits of the rule, it “cannot realistically determine that a rule’s benefits justify its costs,” because “it does not have . . . a general grasp of the rule’s benefits.” *Id.* at 406. The court disagreed, finding the agency’s statement of benefits to have “provided substantial detail on the benefits of the rule, and the reasons why quantification was not possible” and in any case agreeing with the agency that there was no obligation to quantify benefits in any particular way. *Id.*

We think the inquiry posed to the Agency by CAA section 112(n)(1)(A) has similarities to these other decisions, in which agencies tasked with protecting and serving the American public elected to take actions that would impose significant costs in order to achieve important benefits that could not be precisely quantified or were in some cases uncertain—protection from terrorist attacks, speeding the advancement of digital technology, and subjecting a new product to marketing and safety regulation. In those cases, the framework for decision-making was to make a judgment after a weighing of advantages against disadvantages, considering qualitative factors as well as quantified metrics. Here, we employ a similar totality-of-the-circumstances approach to the CAA section 112(n)(1)(A) inquiry as to whether it is appropriate to regulate HAP emissions from EGUs.

Earlier sections of this preamble (sections III.A. and III.B.) discuss in detail the EPA’s evaluation of the public health and environmental advantages of regulating HAP from U.S. EGUs and the reasons it is not possible to quantify or monetize most of those advantages, as well as the EPA’s comprehensive assessment of the costs of doing so. We will not in this section repeat every detail and data point, but we incorporate all of that analysis here and highlight only a few of the considerations that weighed heavily in our application of the preferred totality-of-the-circumstances approach.

Under our preferred approach, we first consider the public health advantages to reducing HAP from EGUs, and the other focuses for study identified by Congress in CAA section 112(n)(1). As noted, we give particular weight in our determination to the information related to the statutory factors identified for the EPA’s consideration by the studies—namely, the hazards to public health reasonably anticipated to occur as a result of EGU HAP emissions (112(n)(1)(A)), the rate and mass of mercury emissions from EGUs (112(n)(1)(B)), the health and environmental effects of such emissions (112(n)(1)(B)), and the levels of mercury exposure below which adverse human health effects are not expected to occur as well as the mercury concentrations in the tissue of fish which may be consumed (including by sensitive populations) without adverse effects to public health (112(n)(1)(C)).

The statutorily mandated studies are the foundation for the Agency’s finding that HAP emissions from U.S. EGUs represent a clear hazard to public health and the environment, but as documented in section III.A., the EPA has continued to amass an extensive body of evidence related to the original study topics that only furthers the conclusions drawn in the earlier studies. As discussed in section III.A, the EPA completed a national-scale risk assessment focused on mercury emissions from U.S. EGUs as part of the 2011 Final Mercury TSD. That assessment specifically examined risk associated with mercury released from U.S. EGUs that deposits to watersheds within the continental U.S., bioaccumulates in fish as methylmercury, and is consumed when fish are eaten by female subsistence fishers of child-bearing age and other freshwater self-caught fish consumers. We focused on the female subsistence fisher subpopulation because there is increased risk for *in utero* exposure and adverse outcomes in children born to female subsistence fishers with elevated exposure to methylmercury.<sup>(113)</sup> Our analysis estimated that 29 percent of the watersheds studied would lead to exposures exceeding the methylmercury RfD for this population, based on *in utero* effects, due in part to the contribution of domestic EGU emissions of mercury. We also found that deposition of mercury emissions from U.S. EGUs alone led to potential exposures that exceed the RfD in up to 10 percent of modeled watersheds.

We have also examined impacts of prenatal methylmercury exposure on unborn children of recreational anglers consuming self-caught fish from inland freshwater lakes, streams, and rivers, and found significant IQ loss in the affected population of children. Our analysis, which we recognized did not cover consumption of recreationally caught seafood from estuaries, coastal waters, and the deep ocean, nevertheless indicated significant health harm from methylmercury exposure. Methylmercury exposure also leads to adverse neurodevelopmental effects such as performance on neurobehavioral tests, particularly on tests of attention, fine motor function, language, and visual spatial ability. See section III.A.2.a.

The population that has been of greatest concern with respect to methylmercury exposure is women of childbearing age because the developing fetus is the most sensitive to the effects of methylmercury. See 85 FR 24995 (May 3, 2011). In the Mercury Study, the EPA estimated that, at the time of the study, 7 percent of women of childbearing age in the continental U.S. (or about 4 million women) were exposed to methylmercury at levels that exceeded the RfD and that about 1 percent of women of childbearing age (or about 580,000 women) had methylmercury exposures three to four times the RfD. See 65 FR 79827 (December 20, 2000). We also performed a new bounding analysis for this proposal that focuses on the potential for IQ points lost in children exposed *in utero* through maternal fish consumption by the population of general U.S. fish consumers (section III.A.3.d).

Another important human health impact documented by the EPA over the last 2 decades includes cardiovascular impacts of exposure to methylmercury—including altered blood-pressure and heart-rate variability in children as a result of infant exposure in the womb and higher risk of acute MI, coronary heart disease, and cardiovascular heart disease in adults, due to dietary exposure. Studies that have become available more recently led the EPA to perform new quantitative screening analyses (as described in section III.A.3) to estimate the incidence of MI (heart attack) mortality that may be linked to U.S. EGU mercury emissions. The new analyses performed include an extension of the original watershed-level subsistence fisher methylmercury risk assessment to evaluate the potential for elevated MI-mortality risk among subsistence fishers (section III.A.3.b; 2021 Risk TSD) and a separate risk assessment examining elevated MI mortality among all adults that explores potential risks associated with exposure of the general U.S. population to methylmercury from domestic EGUs through commercially-sourced fish consumption (section III.A.3.c; 2021 Risk TSD). The updated subsistence fisher analysis estimated that up to 10 percent of modeled watersheds are associated with exposures linked to increased risk of MI mortality, but for some populations such as low-income Black subsistence fishers active in the Southeast, that number is approximately 25 percent of the watersheds modeled. The bounding analysis results estimating MI-mortality attributable to U.S. EGU-sourced mercury for the general U.S. population range from 5 to 91 excess deaths annually. As noted, we give significant weight to these findings and analyses examining public health impacts associated with methylmercury, given the statutory focus in CAA section 112(n)(1)(B) and 112(n)(1)(C) on adverse effects to public health from EGU mercury emissions and the directive to develop an RfD (“threshold level of mercury exposure below which adverse human health effects are not expected to occur”), and in particular one that is designed to assess “mercury concentrations in the tissue of fish which may be consumed (including consumption by sensitive populations).” See CAA section 112(n)(1)(C).

Because of CAA section 112(n)(1)(A)'s broader focus on hazards to public health from all HAP, not just mercury, we also give considerable weight to health effects associated with non-mercury HAP exposure ( see section III.A.2.b for further detail), including chronic health disorders such as irritation of the lung, skin, and mucus membranes; decreased pulmonary function, pneumonia, or lung damage; detrimental effects on the central nervous system; damage to the kidneys; and alimentary effects such as nausea and vomiting). The 2011 Non-Hg HAP Assessment, performed as part of the EPA's 2012 reaffirmation of the appropriate and necessary determination, expanded on the original CAA section 112(n)(1)(A) Utility Study by examining further public health hazards reasonably anticipated to occur from EGU HAP emissions after imposition of other CAA requirements. This study included a refined chronic inhalation risk assessment that was designed to assess how many coal- and oil-fired EGUs had cancer and non-cancer risks associated with them, and indicated that absent regulation, a number of EGUs posed cancer risks to the American public ( see section III.A.2.b).

As discussed in section II.B, the statutory design of CAA section 112 quickly secured dramatic reductions in the volume of HAP emissions from stationary sources. CAA section 112(n)(1)(B) also directs the EPA to study, in the context of the Mercury Study, the “rate and mass” of mercury emissions. We therefore think it is reasonable to

consider, in assessing the advantages to regulating HAP emissions from EGUs, what the volume of emissions was from that sector prior to regulation—as an absolute number and relative to other sources—and what the expected volume of emissions would be with CAA section 112(d) standards in place. Prior to the EPA's promulgation of MATS in 2012, the EPA estimated that in 2016, without MATS, coal-fired U.S. EGUs above 25 MW would emit 29 tons of mercury per year. While these mercury emissions from U.S. EGUs represented a decrease from 1990 and 2005 levels (46 tons and 53 tons, respectively), they still represented nearly half of all anthropogenic mercury emissions in 2011 (29 out of 64 tons total). Considered on a proportional basis, the relative contribution of U.S. EGUs to all domestic anthropogenic mercury emissions was also stark. The EGU sector emitted more than six times as much mercury as any other sector (the next highest being 4.6 tons). See Table 3 at 76 FR 25002 (May 3, 2011). Prior to MATS, U.S. EGUs were estimated to emit the majority of HCl and HF nationally, and were the predominant source of emissions nationally for many metal HAP as well, including antimony, arsenic, chromium, cobalt, and selenium. *Id.* at 25005-06. In 2012, the EPA projected that MATS would result in an 88 percent reduction in hydrogen chloride emissions, a 75 percent reduction in mercury emissions, and a 19 percent reduction in PM emissions (a surrogate for non-mercury metal HAP) from coal-fired units greater than 25 MW in 2015 alone. See 77 FR 9424 (February 16, 2012). In fact, actual emission reductions since MATS implementation have been even more substantial. In 2017, by which point all sources were required to have complied with MATS, the EPA estimated that acid gas HAP emissions from EGUs had been reduced by 96 percent, mercury emissions had been reduced by 86 percent, and non-mercury metal HAP emissions had been reduced by 81 percent compared to 2010 levels. See 84 FR 2689 (February 7, 2019). Retaining the substantial reductions in the volume of toxic pollution entering our air, water, and land, from this large fleet of domestic sources reduces the substantial risk associated with this pollution faced by all Americans.

Even though reducing HAP from EGUs would benefit all Americans by reducing risk and hazards associated with toxic air pollution, it is worth noting that the impacts of EGU HAP pollution in the U.S. have not been borne equally nationwide. Certain communities and individuals have historically borne greater risk from exposure to HAP emissions from EGUs prior to MATS, as demonstrated by the EPA's risk analyses. The individuals and communities that have been most impacted have shouldered a disproportionate burden for the energy produced by the power sector, which in turn benefits everyone—*i.e.*, these communities are subject to a greater share of the externalities of HAP pollution that is generated by EGUs producing power for everyone. A clear example of these disproportionately impacted populations are subsistence fishers who live near U.S. EGUs experiencing increased risk due to U.S. EGU mercury deposition at the watersheds where they are active (2011 Final Mercury TSD). CAA section 112(n)(1)(C) directed the EPA to examine risks to public health experienced by sensitive populations as a result of the consumption of mercury concentrations in fish tissue, which we think includes fetuses and communities that are reliant on local fish for their survival, and CAA section 112 more generally is drafted in order to be protective of small cohorts of highly exposed and susceptible populations. We therefore weigh heavily the importance of reducing risks to particularly impacted populations, including those who consume large amounts of self-caught fish reflecting cultural practice and/or economic necessity, including tribal populations, specific ethnic communities and low-income populations including Black persons living in the southeastern U.S.

Consistent with CAA section 112(n)(1)(B) and the general goal of CAA section 112 to reduce risks posed by HAP to the environment, we also consider the ecological effects of methylmercury and acid gas HAP ( see section III.A.2.c). Scientific studies have consistently found evidence of adverse impacts of methylmercury on fish-eating birds and mammals, and insect-eating birds. These harmful effects can include slower growth and development, reduced reproduction, and premature mortality. Adverse environmental impacts of emissions of acid gas HAP, in particular HCl, include acidification of terrestrial and aquatic ecosystems. In the EPA's recent *Integrated Science Assessment for Oxides of Nitrogen, Oxides of Sulfur and Particulate Matter — Ecological Criteria* (2020), we concluded that the body of evidence is sufficient to infer a causal relationship between acidifying deposition and adverse changes in freshwater biota like plankton, invertebrates, fish, and other organisms. Adverse effects on those animals can include physiological impairment, loss of species, changes in community composition, and biodiversity. Because EGUs contribute to mercury deposition in the U.S., we conclude that EGUs are contributing to the identified adverse environmental effects, and consider the beneficial impacts of mitigating those effects by regulating EGUs.

We turn next in our application of the preferred approach to the consideration of the disadvantages of regulation, which in this case we measure primarily in terms of the costs of that regulation. As discussed in section III.B, for purposes of this preferred totality-of-the-circumstances approach, we start with the sector-level estimate developed in the 2011 RIA. Given the complex, interconnected nature of the power sector, we think it is appropriate to consider this estimate, which represents the incremental costs to the entire power sector to generate electricity, not just the compliance costs projected to be borne by regulated EGUs. We explain in section III.B that while a precise *ex post* estimate of this sector-level figure is not possible, we update those aspects of the cost estimate where we can credibly do so ( see section III.B.2), and our consideration of the cost of regulation therefore takes into account the fact that new analyses performed as part of this proposal demonstrate that the 2011 RIA cost estimate was almost certainly significantly overestimated. We propose to conclude that regulation is appropriate and necessary under either cost estimate.

As with the benefits side of the ledger, where we look comprehensively at the effects of reducing the volume of HAP, we also comprehensively assess costs in an attempt to evaluate the economic impacts of the regulation as a whole. We situate the cost of the regulation in the context of the economics of power generation, as we did in 2016, because we think examining the costs of the rule relative to three sector-wide metrics provides a useful way to evaluate the disadvantages of expending these compliance costs to this sector beyond a single monetary value. For each of these metrics, we use our 2011 estimate of compliance costs, which, as is discussed in section III.B.2 and the Cost TSD, was likely to have been significantly overestimated by a figure in the billions of dollars. We first evaluate the 2011 projected annual compliance costs of MATS as a percent of annual power sector sales, also known as a “sales test.” A sales test is a frequently used indicator of potential impacts from compliance costs on regulated industries, and the EPA’s analysis showed that projected 2015 compliance costs, based on the 2011 estimate, represented between 2.7-3.5 percent of power sector revenues from historical annual retail electricity sales. See section III.B.3; Cost TSD; 80 FR 75033 (December 1, 2015). We also examine the annual capital expenditures that were expected for MATS compliance as compared to the power sector’s historical annual capital expenditures. We conclude that projected incremental annual capital expenditures of MATS would be a small percentage of 2011 power sector-level capital expenditures, and well within the range of historical year-to-year variability on industry capital expenditures. *Id.* Finally, we consider the annual operating or production expenses in addition to capital expenditures because we were encouraged during the 2016 rulemaking to use this broader metric of power industry costs to provide perspective on the cost of MATS relative to total capital and operational expenditures by the industry historically. Consistent with our other findings, we conclude that, even when using the likely overestimated cost of MATS based on the 2011 RIA, the total capital and operational expenditures required by MATS are in the range of about 5 percent of total historical capital and operational expenditures by the power sector during the period of 2000-2011. See section III.B.3; Cost TSD; 81 FR 24425 (April 25, 2016). In this proposal, we re-analyze all of these metrics using updated data to reflect more recent information (as of 2019), and took into consideration the fact that the 2011 RIA cost estimate was almost certainly significantly overestimated. All of this new analysis further supports our findings as to the cost of MATS relative to other power sector economics based on the record available to the Agency at the time we were making the threshold determination ( *i.e.*, the 2012 record).

Consistent with the *Michigan* Court’s instruction to consider all advantages and disadvantages of regulation, we also assess, as we did in 2016, disadvantages to regulation that would flow to the greater American public. Specifically, we examine whether regulation of EGUs would adversely impact the provision of reliable, affordable electricity to the American public, because had regulation been anticipated to have such an effect, it would have weighed heavily on our decision as to whether it was appropriate to require such regulation. The CAA tasks the EPA with the purpose of protecting and enhancing air quality in the U.S., but directs that in doing so we promote public health and welfare *and* the productive capacity of the U.S. population. CAA section 101(b)(1). As noted, we also think examining these potential impacts is consistent with the “broad and all-encompassing” nature of the term “appropriate,” as characterized by the Supreme Court. *Michigan*, 576 U.S. at 752. We were particularly interested in examining the expected impact of MATS implementation on the retail price of electricity, because in electricity markets, utility expenditures can be fully or partially passed to consumers. It was therefore reasonable to assume that the cost of MATS could result in increased retail electricity prices for consumers, although we emphasize, as we did in 2016, that the electricity price impacts examined under this metric do not reflect *additional* compliance

costs on top of the estimate produced in the 2011 RIA but rather reflect the passing on of a share of those costs to consumers (and ultimately reducing the costs EGU owners would otherwise bear). However, even though the impacts on electricity prices are reflected in the total cost estimate to the sector as a whole, we think, for the reasons stated above, that electricity price impacts are worthy of special attention because of the potential effect on the American public.

We therefore estimate the percent increase in retail electricity prices projected to result from MATS compared to historical levels of variation in electricity prices. See section III.B.3; 80 FR 75035 (December 1, 2015). We estimate that retail electricity prices for 2015 would increase by about 0.3 cents per kilowatt-hour, or 3.1 percent with MATS in place. Between 2000 and 2011, the largest annual year-to-year decrease in retail electricity price was -0.2 cents per kilowatt-hour and the largest year-to-year increase during that period was +0.5 cents per kilowatt-hour. The projected 0.3 cents increase due to MATS was therefore well within normal historical fluctuations. *Id.* As with the other metrics examined, as the increase in retail electricity prices due to MATS was within the normal range of historical variability, a substantially lower estimate for impacts on electricity prices would only further support the EPA's determination. We also note in section III.B.3 that the year-to-year retail electricity price changes in the new information we examined (*i.e.*, years 2011-2019) were within the same ranges observed during the 2000-2011 period, and that in fact, during that period when MATS was implemented, retail electricity prices have generally decreased (9.3 cents per kilowatt-hour in 2011 to 8.7 cents per kilowatt-hour in 2019). Consistent with these observed trends in retail electricity prices, as discussed in section III.B.2 and further below, our *ex post* analysis of MATS indicates that the projected compliance costs in the 2011 RIA—and, as a corollary, the projected increases in retail electricity prices—were likely significantly overestimated. Certainly, we have observed nothing in the data that suggests the regulation of HAP from EGUs resulted in increases in retail electricity prices for the American public that would warrant substantial concern in our weighing of this factor.

Similar to our reasoning for examining impacts on electricity prices for American consumers, in assessing the potential disadvantages to regulation, we elected to also look at whether the power sector would be able to continue to provide reliable electricity to all Americans after the imposition of MATS. We think this examination naturally fits into our assessment of whether regulation is “appropriate,” because had MATS interfered with the provision of reliable electricity to the American public, that would be a significant disadvantage to regulation to weigh in our analysis. In examining this factor, we looked at both resource adequacy and reliability—that is, the provision of generating resources to meet projected load and the maintenance of adequate reserve requirements for each region (resource adequacy) and the sector's ability to deliver the resources to the projected electricity loads so that the overall power grid remains stable (reliability). See section III.B.3; U.S. EPA 2011, Resource Adequacy and Reliability TSD; 80 FR 75036 (December 1, 2015). Our analysis indicated that the power sector would have adequate and reliable generating capacity, while maintaining reserve margins over a 3-year MATS compliance period. *Id.* We did not in this proposal update the Resource Adequacy and Reliability Study conducted in 2011, but we note that the EPA, as a primary regulator of EGUs, is keenly aware of adequacy and reliability concerns in the power sector and in particular the relationship of those concerns to environmental regulation. We have not seen evidence in the last decade to suggest that the implementation of MATS caused power sector adequacy and reliability problems, and only a handful of sources obtained administrative orders under the enforcement policy issued with MATS to provide relief to reliability critical units that could not comply with the rule by 2016.

In addition to the cost analyses described above, the EPA revisited its prior records examining the costs of mercury controls consistent with the requirement in CAA section 112(n)(1)(B), the cost of controls for other HAP emissions from EGUs, and the cost of implementing the utility-specific ARP, which Congress wrote into the 1990 CAA Amendments and implementation of which Congress anticipated could result in reductions in HAP emissions. 80 FR 75036-37 (December 1, 2015). The ARP, like MATS, was expected to have a significant financial impact on the power sector, with projections of its cost between \$6 billion to \$9 billion per year (in 2000 dollars), based on the expectation that many utilities would elect to install FGD scrubbers in order to comply with the ARP. *Id.* at 75037. The actual costs of compliance were much less (up to 70 percent lower than initial estimates), in large part because of the utilities' choice to comply with the ARP by switching to low sulfur coal instead of installing scrubbers.<sup>(114)</sup> This choice also resulted in far fewer reductions in HAP emissions than would have occurred if more EGUs had installed

SO<sub>2</sub> scrubbers. We believe the considerable reduction in the implementation cost of the ARP is important because of the economic benefit that accrued from delaying the large capital costs of controls by almost 25 years. With respect to the costs of technology for control of mercury and non-mercury HAP, the record evidence shows that in 2012 controls were available and routinely used and that control costs had declined considerably over time. *Id.* at 75037-38. We also note that, as explained at length in section III.B.2, the actual compliance costs of MATS, with respect to capital and operating expenditures associated with installing and operating controls, were significantly lower than what we projected at the time of the rule. In addition, the newer information examined as part of this proposal demonstrates that actual control costs were much lower than we projected, which weighs further in favor of a conclusion that it is appropriate to impose those costs in order to garner the advantages of regulation.

Our review of the record and application of the preferred totality-of-the-circumstances approach has demonstrated that we have, over the last 2 decades, amassed a voluminous and scientifically rigorous body of evidence documenting the significant hazards to public health associated with HAP emissions from EGUs, particularly to certain vulnerable populations that bear greater risk from these emissions than the general public. We have looked at the volume of emissions coming from these sources and what the impact of regulation would be on that volume. We examined the cost of regulation to industry (even using an estimate of cost that we know to be higher than what was expended), and the potential adverse impacts that could be felt by the American public via increased electricity prices and access to reliable electricity. And, consistent with the statute, we have also considered adverse impacts of EGU pollution on the environment as well as availability of controls and the costs of those controls.

Even based solely on the record available to us at the time we issued the regulation and made the threshold determination in 2012, we find that the benefits of regulation are manifold, and they address serious risks to vulnerable populations that remained after the implementation of the ARP and other controls imposed upon the power sector that were required under the CAA. We have placed considerable weight on these benefits, given the statutory directive to do so in CAA section 112(n)(1)(A) and Congress' clear purpose in amending CAA section 112 in 1990. In contrast, the costs, while large in absolute terms, were shown in our analyses to be within the range of other expenditures and commensurate with revenues generated by the sector, and our analysis demonstrated that these expenditures would not and did not have any significant impacts on electricity prices or reliability. After considering and weighing all of these facts and circumstances, in an exercise of his discretion under the Act, the Administrator proposes to conclude that the substantial benefits of reducing HAP from EGUs, which accrue in particular to the most vulnerable members of society, are worth the costs. Consequently, we propose to find after weighing the totality of the circumstances, that regulation of HAP from EGUs is appropriate after considering cost.

The newer information examined as part of this proposal regarding both benefits and costs is directionally consistent with all of the findings the EPA has made in the 2016 administrative record. The robust and long-standing scientific foundation regarding the adverse health and environmental risks from mercury and other HAP is fundamentally unchanged since the comprehensive studies that Congress mandated in the CAA were completed decades ago. But in this proposal, we completed screening level risk assessments, informed by newer meta-analyses of the dose-response relationship between methylmercury and cardiovascular disease, which indicate that a segment of the American public is at increased risk of prematurely dying by heart attack due to methylmercury exposure with as many as 91 deaths per year (and possibly more) being attributable to mercury emissions from EGUs. <sup>(115)</sup> Further, analyses show that some populations ( e.g., low-income Blacks in the Southeast and certain tribal communities engaging in subsistence fishing activity) likely bear a disproportionately higher risk from EGU HAP emissions than the general populace.

The new cost information analyzed by the EPA, discussed in section III.B, indicates that the cost projection used in the 2016 Supplemental Finding ( *i.e.*, the 2011 RIA cost estimate) likely significantly overestimated the actual costs of compliance of MATS. Specifically, the EGU sector installed far fewer controls to comply with the HAP emissions standards than projected; certain modeling assumptions, if updated with newer information, would have resulted in a lower cost estimate; unexpected advancements in technology occurred; and the country experienced a dramatic increase in the availability of comparatively inexpensive natural gas. All of these factors likely resulted in a lower actual cost of compliance than the EPA's projected estimates in 2011. We therefore find that when we consider

information available to the Agency after implementation of the rule, our conclusion that it was appropriate to regulate this sector for HAP is further strengthened. The costs projected in the 2011 RIA were almost certainly overestimated by an amount in the billions of dollars.

We note as well that during prior rulemaking processes related to the appropriate and necessary determination, stakeholders suggested that undermining the threshold finding in order to pave the way to rescinding MATS would have grave economic and health consequences. Utilities reported that they rely upon the mandated status of MATS in order to recoup expenditures already made to comply with the rule before Public Utility Commission proceedings. <sup>(116)</sup> States asserted that they rely upon the Federal protections achieved by the rule in state implementation planning and other regulatory efforts. <sup>(117)</sup> And other industries, such as pollution control companies, have made business decisions based on the existence of MATS. <sup>(118)</sup> We think these reliance interests, nearly all of which are aligned, also weigh in favor of retaining the appropriate and necessary determination, particularly given the fact that a significant portion of compliance costs have already been spent.

Finally, while we focus on the HAP benefits, we note that the *Michigan* court directed that “any disadvantage could be termed a cost.” *Michigan*, at 752. The corollary is that any advantage could be termed a benefit. And so, while it is not necessary to our conclusion that regulation is appropriate, we also consider, under our totality-of-the-circumstances approach, whether there are additional advantages or disadvantages to the specific controls imposed under MATS. Specifically, we note that because the controls required to reduce HAP from U.S. EGUs resulted in substantial reductions in co-emitted pollutants, including direct PM<sub>2.5</sub> as well as SO<sub>2</sub> and NO<sub>x</sub>, which are both precursors to ozone and fine particle formation, the Administrator’s proposed conclusion is further supported by the ramifications of the regulatory requirements in MATS for these pollutants. We propose that the benefits associated with such reductions may be appropriate to consider where the framework for making the CAA section 112(n)(1)(A) determination is a totality-of-the-circumstances approach, and we take comment on that approach. Therefore, while we conclude that the benefits associated with regulating HAP alone outweigh the costs without consideration of non-HAP benefits, we also propose that, to the extent we consider benefits attributable to reductions in co-emitted pollutants as a concomitant advantage, these benefits act to confirm that regulation is appropriate under a totality-of-the-circumstances approach. Specifically, we note that reductions in co-emissions of direct PM<sub>2.5</sub>, SO<sub>2</sub> and NO<sub>x</sub> will have substantial health benefits in the form of decreased risk of premature mortality among adults, and reduced incidence of lung cancer, new onset asthma, exacerbated asthma, and other respiratory and cardiovascular diseases. In the 2011 RIA, the EPA estimated the number and value of avoided PM<sub>2.5</sub>-related impacts, including 4,200 to 11,000 premature deaths, 4,700 nonfatal heart attacks, 2,600 hospitalizations for respiratory and cardiovascular diseases, 540,000 lost work days, and 3.2 million days when adults restrict normal activities because of respiratory symptoms exacerbated by PM<sub>2.5</sub>. We also estimated substantial additional health improvements for children from reductions in upper and lower respiratory illnesses, acute bronchitis, and asthma attacks. In addition, we estimated the benefit of reductions in CO<sub>2</sub> emissions under MATS. Although the EPA only partially monetized the benefits associated with these reductions in co-emitted pollutants in the 2011 RIA, the Agency estimated that—due in particular to the strong causal relationship between PM<sub>2.5</sub> and premature mortality—these reductions could result in as much as \$90 billion (in 2016 dollars) in additional public health benefits annually. Therefore, if these non-HAP benefits are considered in the totality-of-the-circumstances approach, we take note of the fact that regulating EGUs for HAP emissions results in substantial other health benefits accruing to the American public by virtue of regulating HAP from EGUs.

#### E. The Administrator’s Proposed Benefit-Cost Analysis Approach and Proposed Conclusion

In addition to the preferred approach, we separately put forward an alternative approach, as we did in 2016, to support a determination that it is appropriate and necessary to regulate HAP from EGUs when looking at the results of a formal BCA. The formal BCA we conducted for purposes of meeting Executive Order 12866 using established BCA practices also demonstrates that the benefits estimated for MATS far exceed the estimated costs, as reported in the 2011 RIA. <sup>(119)</sup> In its net benefits projection, the 2011 RIA monetized only one post control benefit from regulating HAP emissions from EGUs because the Agency did not and does not have the information necessary to monetize the many other benefits associated with reducing HAP emissions from EGUs. See section III.A.4. However, the 2011 RIA properly accounted for all benefits by discussing qualitatively those that could not be quantified and/or monetized. While some of the impacts on particularly impacted populations—such as the children

of recreational anglers experiencing IQ loss—were reflected in the net benefits calculation, that accounting does not really grapple with the equitable question of whether a subset of Americans should continue to bear disproportionate health risks in order to avoid the increased cost of controlling HAP from EGUs. We continue to prefer a totality-of-the-circumstances approach to making the determination under CAA section 112(n)(1)(A), but we think that if a BCA is to be used, it should, consistent with economic theory and principles, account for all costs and all benefits.

BCA has been part of executive branch rulemaking for decades. Over the last 50 years, Presidents have issued Executive Orders directing agencies to conduct these analyses as part of the rulemaking development process. Executive Order 12866, currently in effect, requires a quantification of benefits and costs to the extent feasible for any regulatory action that is likely to result in a rule that may have an annual effect on the economy of \$100 million or more or adversely affect in a material way certain facets of society. Executive Order 12866, at section 3(f)(1).

The EPA performed a formal BCA to comport with Executive Order 12866 as part of the 2012 MATS rulemaking process (referred to herein as the 2011 RIA). In the 2016 Supplemental Finding, the EPA relied on the BCA it had performed for Executive Order 12866 purposes as an alternative basis upon which to make the appropriate and necessary determination. That BCA, which reflected in its net benefits calculation only certain categories of benefits that could be confidently monetized, estimated that the final MATS would yield annual *net* monetized benefits (in 2007 dollars) of between \$37 billion to \$90 billion using a 3-percent discount rate and \$33 billion to \$81 billion using a 7-percent discount rate. See 80 FR 75040 (December 1, 2015). These estimates included the portion of the HAP benefits described in section III.A that could be monetized at the time, along with additional health benefits associated with the controls necessary to control the HAP emissions from U.S. EGUs. Specifically, as noted, the net benefits estimates included only one of the many HAP benefits associated with reduction of HAP. Nonetheless, the monetized benefits of MATS outweighed the estimated \$9.6 billion in annual monetized costs by between 3-to-1 or 9-to-1 depending on the benefit estimate and discount rate used. The implementation of control technologies to reduce HAP emissions from EGU sources also led to reductions in emissions of SO<sub>2</sub>, direct PM<sub>2.5</sub>, as well as other precursors to PM<sub>2.5</sub> and ozone. In the 2011 RIA, the EPA did not quantify the benefits associated with ozone reductions resulting from the emissions controls under MATS, but we did include estimates of the projected benefits associated with reductions in PM<sub>2.5</sub>. These benefits were quite substantial and had a large economic value. Newer scientific studies strengthen our understanding of the link between PM<sub>2.5</sub> exposure to a variety of health problems, including: premature death, lung cancer, non-fatal heart attacks, new onset asthma, irregular heartbeat, aggravated asthma, decreased lung function, and respiratory symptoms, such as irritation of the airways, coughing or difficulty breathing. Furthermore, since the RIA was completed in 2011, the EPA has updated its conclusions about how PM<sub>2.5</sub> emissions can adversely affect the environment through acidic deposition, materials damage, visibility impairment, and exacerbating climate change (EPA, 2019).<sup>(120)</sup> In its most recent review of the effects of ozone pollution, the EPA concluded that ozone is associated with a separate but similarly significant set of adverse outcomes including respiratory-related premature death, increased frequency of asthma attacks, aggravated lung disease, and damage to vegetation (EPA, 2020).<sup>(121)</sup>

BCAs are a useful tool to “estimate the *total* costs and benefits to society of an activity or program,” and “can be thought of as an accounting framework of the overall social welfare of a program.” EPA Economic Guidelines, Appendix A, A-6 (emphasis in original).<sup>(122)</sup> In a BCA, “[t]he favorable effects of a regulation are the benefits, and the foregone opportunities or losses in utility are the costs. Subtracting the total costs from the total monetized benefits provides an estimate of the regulation’s net benefits to society.” *Id.* Importantly, however, “[t]he key to performing BCA lies in the ability to measure both benefits and costs in monetary terms so that they are comparable.” *Id.*; see also OMB Circular A-4 (“A distinctive feature of BCA is that both benefits and costs are expressed as monetary units, which allows you to evaluate different regulatory options with a variety of attributes using a common measure.”).<sup>(123)</sup>

In the 2020 Final Action, the EPA rescinded the 2016 alternative approach on the basis that it was “fundamentally flawed” because it applied “a formal cost-benefit analysis” to the CAA section 112(n)(1)(A) determination. The Agency’s objection at the time to the use of “a formal cost-benefit analysis” in the context of this determination was that doing so “implied that an equal weight was given to the non-HAP co-benefit emission reductions and the HAP-specific benefits of the regulation.” See 85 FR 31299 (May 22, 2020). The Agency concluded that it was not

appropriate to use a formal BCA in this situation because “to give equal weight to the monetized PM<sub>2.5</sub> co-benefits would permit those benefits to become the driver of the regulatory determination, which the EPA believes would not be appropriate.” *Id.* The EPA reiterated in the 2020 Final Action that “HAP benefits, as compared to costs, must be the primary question in making the ‘appropriate and necessary’ determination” and “the massive disparity between co-benefits and HAP benefits on this record would mean that that alternative approach clearly elevated co-benefits beyond their permissible role.” *Id.* at 31303. “To be valid, the EPA’s analytical approach to [CAA section 112(n)(1)(A)] must recognize Congress’ particular concern about risks associated with HAP and the benefits that would accrue from reducing those risks.” *Id.* at 31301.

We agree that the analytical framework for the appropriate and necessary determination should first and foremost be one that is focused on “Congress’ particular concern about risks associated with HAP and the benefits that would accrue from reducing those risks.” *Id.* It is for this reason, as discussed in section III.C of this preamble, that we propose to revoke the analytical framework advanced for the appropriate and necessary determination by the 2020 Final Action, as being insufficiently attentive to the public health advantages of regulation. However, if the decisional framework is going to be one that considers advantages to regulation primarily in terms of potential monetized outcomes ( see 85 FR 31296-97; May 22, 2020), a formal BCA that estimates net outcomes ( *i.e.*, by comparing total losses and gains) and conforms to established economic best practices and accounts for *all* of the effects of the rule that can be quantified should be used. <sup>(124)</sup>

Consistent with scientific principles underlying BCA, both OMB Circular A-4 and the EPA’s Guidelines for Preparation of Economic Analyses direct the Agency to include all benefits in a BCA. Per Circular A-4, OMB instructs “Your analysis should look beyond the direct benefits and direct costs of your rulemaking and consider any important ancillary benefits and countervailing risks. An ancillary benefit is a favorable impact of the rule that is typically unrelated or secondary to the statutory purpose of the rulemaking.” Circular A-4 at 26. Similarly, the Guidelines state, “An economic analysis of regulatory or policy options should present all identifiable costs and benefits that are incremental to the regulation or policy under consideration. These should include directly intended effects and associated costs, as well as ancillary (or co-) benefits and costs.” Guidelines at 11-2. As discussed in prior MATS rulemakings ( see, *e.g.*, 80 FR 75041; December 1, 2015), installing control technologies and implementing the compliance strategies necessary to reduce the HAP emissions directly regulated by the MATS rule also results in reductions in the emissions of other pollutants such as directly emitted PM<sub>2.5</sub> and SO<sub>2</sub> (a PM<sub>2.5</sub> precursor). A particularly cost-effective control of emissions of particulate-bound mercury and non-mercury metal HAP is through the use of PM control devices that indiscriminately collect PM along with the metal HAP, which are predominately present as particles. Similarly, emissions of the acid gas HAP are reduced by acid gas controls that are also effective at reducing emissions of SO<sub>2</sub> (also an acid gas, but not a HAP). *Id.* While these PM<sub>2.5</sub> and SO<sub>2</sub> emission reductions are not the objective of the MATS rule, the reductions are, in fact, a direct consequence of regulating the HAP emissions from EGUs. Specifically, controls on direct PM<sub>2.5</sub> emissions are required to reduce non-mercury metal HAP, while SO<sub>2</sub> emissions reductions come from controls needed to reduce acid gas emissions from power plants.

However, we recognize that there are significant reasons to question whether a formal BCA is the best way to interpret the Agency’s mandate in CAA section 112(n)(1)(A), and we take comment on whether the Agency should continue to rely on this alternative basis for making its determination. We have consistently taken the position that a formal BCA is not required under CAA section 112(n)(1)(A). See 80 FR 75039 (December 1, 2015). As set forth above, in *Michigan*, the Supreme Court declined to hold that CAA section 112(n)(1)(A) required such an assessment, stating, “We need not and do not hold that the law unambiguously required the Agency, when making this preliminary estimate, to conduct a formal cost-benefit analysis in which each advantage and disadvantage is assigned a monetary value.” *Michigan*, 576 U.S. at 759. However, the Court did note that “[c]onsideration of cost reflects the understanding that reasonable regulation ordinarily requires paying attention to the advantages *and* disadvantages of agency decisions.” *Id.* at 2707. Moreover, in finding the EPA’s decision not to consider cost irrational, the Court suggested that unintended disadvantages of a regulation could be considered costs as well, implying that such disadvantages should be accounted for. *Id.* at 2707 (“The Government concedes that if the

Agency were to find that emissions from power plants do damage to human health, but that the technologies needed to eliminate these emissions do even more damage to human health, it would still deem regulation appropriate. No regulation is 'appropriate' if it does significantly more harm than good.”).

In the 2015 Proposal, we identified several policy reasons for preferring to apply a totality-of-the-circumstances approach to weighing costs and benefits over using a formal BCA as our decisional framework under CAA section 112(n)(1)(A). See 80 FR 75025 (December 1, 2015). We recognized that benefits like those associated with reduction of HAP can be difficult to monetize, and this incomplete quantitative characterization of the positive consequences can underestimate the monetary value of net benefits. See 80 FR 75039 (December 1, 2015). This is well-established in the economic literature. As noted in OMB Circular A-4, “[w]here all benefits and costs can be expressed as monetary units, BCA provides decision makers with a clear indication of the most efficient alternative.” Circular A-4 at 2. However, “[w]hen important benefits and costs cannot be expressed in monetary units, BCA is less useful, and it can even be misleading, because the calculation of net benefits in such cases does not provide a full evaluation of all relevant benefits and costs.” Circular A-4 at 10. The EPA’s Guidelines for Preparation of Economic Analyses also recognizes the limitations of BCA, noting that “[m]ost important, [BCA] requires assigning monetized values to non-market benefits and costs. In practice it can be very difficult or even impossible to quantify gains and losses in monetary terms ( e.g., the loss of a species, intangible effects).” Guidelines, Appendix A at A-7.

We also pointed out in the 2015 Proposal that national level BCAs may not account for important distributional effects, such as impacts to the most exposed and most sensitive individuals in a population. See 80 FR 75040 (December 1, 2015). These distributional effects and equity considerations are often considered outside of (or supplementary to) analyses like BCAs that evaluate whether actions improve economic efficiency ( i.e., increase net benefits). For example, children near a facility emitting substantial amounts of lead are at significantly greater risk of neurocognitive effects (including lost IQ) and other adverse health effects. One perspective on the costs and benefits of controlling lead pollution would be to aggregate those costs and benefits across society, as in a BCA net benefits calculation. However, neither costs nor benefits are spread uniformly across society and failing to take account of that can overlook significant health risks for sensitive subpopulations, such as children exposed to lead pollution. Similarly, in the context of this determination, where we have found disproportionate risk for certain highly exposed or sensitive populations, such considerations are also particularly relevant. See section II.B; section III.A.

We note too that OMB Circular A-4 highlights the special challenges associated with the valuation of health outcomes for children and infants, because it is “rarely feasible to measure a child’s willingness to pay for health improvement” and market valuations such as increased “wage premiums demanded by workers to accept hazardous jobs are not readily transferred to rules that accomplish health gains for children.” Circular A-4 at 31. We take comment on whether a BCA, on its own, is an appropriate tool to make a determination of whether to regulate under CAA section 112(n)(1)(A), given that it may not meaningfully capture all the societal interests the statute intends the EPA to consider. See Guidelines, Appendix A at A-7 (“In some cases a policy may be considered desirable even if the benefits do not outweigh the costs, particularly if there are ethical or equity concerns.”).

With those caveats, we propose to reaffirm using a BCA approach, based on the 2011 RIA performed as part of the original MATS rulemaking, as another way to make the CAA section 112(n)(1)(A) determination of whether it is appropriate to regulate HAP emissions from EGUs.

Applying the alternative approach, based on the 2011 RIA, we propose to find that it is appropriate to regulate EGUs for HAP under CAA section 112(n)(1)(A). In the 2011 RIA, the total benefits of MATS were estimated to vastly exceed the total costs of the regulation. As we found when applying the 2016 alternative approach, the formal BCA that the EPA performed for the 2012 MATS Final Rule estimated that the final MATS rule would yield annual monetized total benefits (in 2007 dollars) of between \$37 billion to \$90 billion using a 3-percent discount rate and between \$33 billion to \$81 billion using a 7-percent discount rate; this compares to projected annual compliance costs of \$9.6 billion. This estimate of benefits was limited to those health outcomes the EPA was able to monetize. Despite the fact that these estimates captured only a portion of the benefits of the rule, excluding many important HAP and criteria pollutant-related endpoints which the Agency was unable to monetize ( see

section III.A.4) and instead discussed qualitatively in the 2011 RIA, it was clear that MATS was projected to generate overwhelmingly net positive effects on society. We continue to think that the BCA approach independently supports the conclusion that regulation of HAP emissions from EGUs is appropriate.

Although as discussed in section III.B.2 it was not possible for the EPA to update the entire comprehensive cost estimate found in the 2011 RIA, we think the new information presented in sections III.A and III.B directionally supports the net benefits calculation of the 2016 alternative approach. That is, we have attempted to quantify additional risks, including risks of premature death from heart attacks that result from exposure to methylmercury associated with domestic EGU emissions, and we believe the 2011 RIA's projected cost was almost certainly significantly overestimated. Therefore, we propose that if BCA is a reasonable tool to use in the context of the EPA's determination under CAA section 112(n)(1)(A), newer data collected since 2011 overwhelmingly support an affirmative determination. Further, that both analytical approaches to addressing the inquiry posed by *Michigan* lead to the same result reinforces the reasonableness of the EPA's ultimate decision that it is appropriate and necessary to regulate HAP emissions from EGUs after considering cost.

In this proposal, the EPA has re-examined the extensive record, amassed over 2 decades, identifying the advantages of regulating HAP from EGUs and evaluating the costs of doing so. We have, for purposes of this proposal, also updated information on both benefits and costs. Of note, we find that new scientific literature indicates that methylmercury exposure from EGUs, absent regulation, poses cardiovascular and neurodevelopmental risks to all Americans and particularly those most exposed to this pollution. With respect to costs, we explain the combination of factors that occurred since the promulgation of MATS that leads us to believe that the projected, sector-level \$9.6 billion estimate of the cost of compliance of the rule in 2015 was almost certainly significantly overestimated. We propose two different approaches to considering all of this information, applying first a totality-of-the-circumstances methodology weighing of benefits and costs and focusing particularly on those factors that we were instructed by the statute to study under CAA section 112(n)(1), and next using a formal benefit-cost approach consistent with established guidance and economic principles. Under either approach, whether looking at only the information available at the time of our initial decision to regulate or at all currently available information, we propose to conclude that it remains appropriate and necessary to regulate EGUs for HAP. Substantial emission reductions have occurred after implementation of MATS, the emission limits established pursuant to the Agency's 2012 affirmative appropriate and necessary determination, and these limits provide the only Federal guarantee of these emission reductions from EGUs, which, absent regulation, were the largest domestic anthropogenic source of a number of HAP. Finalizing this affirmative threshold determination would provide important certainty about the future of MATS for regulated industry, states, other stakeholders, and the American public. We take comment on the information relied upon in this proposal and the EPA's proposed approaches to considering that information for this determination.

#### IV. Summary of Cost, Environmental, and Economic Impacts

The EPA estimates that there are 557 existing EGUs located at 265 facilities that are subject to the MATS rule. Because the EPA is not proposing any amendments to the MATS rule, there would not be any cost, environmental, or economic impacts as a result of the proposed action.

#### V. Request for Comments and for Information To Assist With Review of the 2020 RTR

On January 20, 2021, President Biden signed Executive Order 13990, "Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis" (86 FR 7037; January 25, 2021). That order, among other things, instructs the EPA to consider publishing a proposed rule suspending, revising, or rescinding the May 22, 2020 final action, "National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units—Reconsideration of Supplemental Finding and Residual Risk and Technology Review." The 2020 Final Action contained two distinct, but related, final actions—(1) a reconsideration of the 2016 Supplemental Finding and (2) the RTR. This notice fulfills the Agency's obligation to address the first action. We solicit comments on all aspects of this proposed action.

Separate from this proposal, the EPA has initiated a review of the RTR, taking into account the latest information available on the experience of EGUs in complying with MATS and implementing measures to reduce HAP emissions. As previously noted, since MATS was promulgated in 2012, power sector emissions of mercury, acid gas HAP, and non-mercury metal HAP have decreased by about 86 percent, 96 percent, and 81 percent, respectively, as compared to 2010 emissions levels (Table 4 at 84 FR 2689, February 7, 2019). While EGUs remain the largest domestic emitter of mercury (and other HAP), their emissions and contribution to total mercury in the environment is significantly less now than before MATS implementation. The EPA is seeking input into how both of these facts should factor into its review of the RTR.

In this notice, the EPA is soliciting information to allow for a more thorough review of the 2020 MATS RTR. The EPA is soliciting broadly for any data or information—including risk-related information—that will assist in the review of the RTR. The EPA is also soliciting specifically for any information on performance or cost of new or additional control technologies, improved methods of operation, or other practices and technologies that may result in cost-effective reductions of HAP emissions from coal- or oil-fired EGUs. In addition, the EPA is interested in receiving information on improvements or upgrades to existing controls that may result in cost-effective reductions of HAP emissions from coal- or oil-fired EGUs. The EPA also seeks information on the cost or performance of technologies and practices relating to monitoring of HAP emissions, and control of HAP emissions during startup and shutdown events, that could result in cost-effective reductions in HAP or assure improved operation of existing controls. We are seeking input from all interested stakeholders, including states, owners of EGUs, technology vendors and developers, and communities impacted by the emissions from EGUs.

## VI. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at <https://www.epa.gov/laws-regulations/laws-and-executive-orders>.

### A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is a significant regulatory action that was submitted to OMB for review under Executive Order 12866. Any changes made in response to OMB recommendations have been documented in the docket. The EPA does not project any incremental costs or benefits associated with this action because it does not impose standards or other requirements on affected sources.

### B. Paperwork Reduction Act (PRA)

This action does not impose any new information collection burden under the PRA. OMB has previously approved the information collection activities contained in the existing regulations and has assigned OMB control number 2060-0567. This action does not impose an information collection burden because the EPA is not proposing any changes to the information collection requirements.

### C. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. This action will not impose any requirements on small entities. The EPA does not project any incremental costs or benefits associated with this action because it does not impose standards or other requirements on affected sources.

### D. Unfunded Mandates Reform Act (UMRA)

This action does not contain an unfunded mandate of \$100 million or more as described in UMRA, 2 U.S.C. 1531-1538, and does not significantly or uniquely affect small governments. The action imposes no enforceable duty on any state, local, or tribal governments or the private sector.

### E. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

#### F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. The executive order defines tribal implications as “actions that have substantial direct effects on one or more Indian tribes, on the relationship between the Federal Government and Indian tribes, or on the distribution of power and responsibilities between the Federal Government and Indian tribes.” Revocation of the 2020 determination that it is not appropriate and necessary to regulate HAP emissions from coal- and oil-fired EGUs under CAA section 112 and reaffirmation of the 2016 Supplemental Finding that it remains appropriate and necessary to regulate HAP emissions from EGUs after considering cost would not have a substantial direct effect on one or more tribes, change the relationship between the Federal Government and tribes, or affect the distribution of power and responsibilities between the Federal Government and Indian tribes. Thus, Executive Order 13175 does not apply to this action.

#### G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

This action is not subject to Executive Order 13045 because it is not economically significant as defined in Executive Order 12866, and because this action does not impose new regulatory requirements that might present a disproportionate risk to children. This action reaffirms the 2016 Supplemental Finding that it is appropriate and necessary to regulate HAP emissions from U.S. EGUs, but does not impose control requirements, which were implemented through MATS (77 FR 9304; February 16, 2012). While this action does not impose or change any standards or other requirements, it addresses the underpinning for the HAP emission standards in MATS. The EPA believes the reductions in HAP emissions achieved under MATS have provided and will continue to provide significant benefits to children in the form of improved neurodevelopment and respiratory health and reduced risk of adverse outcomes. Analyses supporting the 2012 MATS Final Rule estimated substantial health improvements for children in 2016 in the form of 130,000 fewer asthma attacks, 3,100 fewer emergency room visits due to asthma, 6,300 fewer cases of acute bronchitis, and approximately 140,000 fewer cases of upper and lower respiratory illness. See 77 FR 9441 (February 16, 2012). Reaffirming the appropriate and necessary determination assures those benefits will continue to accrue among children.

#### H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not a “significant energy action” because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. This action is not anticipated to have impacts on emissions, costs, or energy supply decisions for the affected electric utility industry as it does not impose standards or other requirements on affected sources.

#### I. National Technology Transfer and Advancement Act (NTTAA)

This action does not involve technical standards.

#### J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action will not have disproportionately high and adverse human health or environmental effects on minority populations, low-income populations, and/or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629; February 16, 1994), because it does not impose standards or other requirements on affected sources and is limited in scope to only consider whether it is appropriate and necessary to regulate HAP emissions from coal- and oil-fired EGUs. While this action does not impose or modify any standards or other requirements, it provides the underpinning for the emission standards regulating HAP from EGUs. As documented in both the NAS Study and Mercury Study, fish and seafood consumption is the primary route of human exposure to methylmercury originating from U.S. EGUs, with populations engaged in subsistence-levels of consumption being of particular concern. As shown in section III.A.5 of this preamble, certain minority, low-income, and indigenous populations are more likely to experience elevated exposures, thus higher health risks relative of the general

population due to subsistence fishing. Furthermore, subpopulations with the higher exposure tend to overlap with those subpopulations that are particularly vulnerable to small changes in health risk because of other social determinants of health ( e.g., lack of access to health care and access to strong schooling), thereby compounding the implications of the implications of mercury exposure. Reaffirming the appropriate and necessary determination assures that the reduction in risks achieved by MATS continue.

Michael S. Regan,  
Administrator.

BILLING CODE 6560-50-P

## Footnotes

(1) As explained in a memorandum to the docket, the docket for this action includes the documents and information, in whatever form, in Docket ID Nos. EPA-HQ-OAR-2009-0234 (National Emission Standards for Hazardous Air Pollutants for Coal- and Oil-fired Electric Utility Steam Generating Units), EPA-HQ-OAR-2002-0056 (National Emission Standards for Hazardous Air Pollutants for Utility Air Toxics; Clean Air Mercury Rule (CAMR)), and Legacy Docket ID No. A-92-55 (Electric Utility Hazardous Air Pollutant Emission Study). See memorandum titled *Incorporation by reference of Docket Number EPA-HQ-OAR-2009-0234, Docket Number EPA-HQ-OAR-2002-0056, and Docket Number A-92-55 into Docket Number EPA-HQ-OAR-2018-0794* (Docket ID Item No. EPA-HQ-OAR-2018-0794-0005).

(2) The 2020 Final Action, while reversing the 2016 Supplemental Finding as to the EPA's determination that it was "appropriate" to regulate HAP from EGUs, did not rescind the Agency's prior determination that it was necessary to regulate. See 84 FR 2674 (February 7, 2019). Instead, the 2020 rulemaking stated that its rescission was based on the appropriate prong alone: "CAA section 112(n)(1)(A) requires the EPA to determine that both the appropriate *and* necessary prongs are met. Therefore, if the EPA finds that either prong is not satisfied, it cannot make an affirmative appropriate and necessary finding. The EPA's reexamination of its determination . . . focuses on the first prong of that analysis." *Id.*

Office of Air Quality Planning and Standards. November 2011. EPA-452/R-11-013. Docket ID Item No. EPA-HQ-OAR-2009-0234-19912 (2011 Non-Hg HAP Assessment).

(12) Although the 2012 MATS Final Rule has been amended several times, the amendments are not a result of actions regarding the appropriate and necessary determination and, therefore, are not discussed in this preamble. Detail regarding those amendatory actions can be found at <https://www.epa.gov/stationary-sources-air-pollution/mercury-and-air-toxics-standards>.

(13) Available at [www.ecfr.gov/cgi-bin/text-idx?node=sp40.15.63.uuuuu](http://www.ecfr.gov/cgi-bin/text-idx?node=sp40.15.63.uuuuu).

(14) In discussing the 2011 Final Mercury TSD, the D.C. Circuit concluded that the EPA considered the available scientific information in a rational manner, and stated:

As explained in the technical support document (TSD) accompanying the Final Rule, EPA determined that mercury emissions posed a significant threat to public health based on an analysis of women of child-bearing age who consumed large amounts of freshwater fish. See [2011 Final] Mercury TSD . . . . The design of EPA's TSD was neither arbitrary nor capricious; the study was reviewed by EPA's independent Science Advisory Board, stated that it "support[ed] the overall design of and approach to the risk assessment" and found "that it should provide an objective, reasonable, and credible determination of potential for a public health hazard from mercury emissions emitted from U.S. EGUs." . . . . In addition, EPA revised the final TSD to address SAB's remaining concerns regarding EPA's data collection practices.

*Id.* at 1245-46.

(15) For example, see "Economic Impact and Small Business Analysis-Mineral Wool and Wool Fiberglass RTRs and Wool Fiberglass Area Source NESHAP" (U.S. EPA, 2015; [https://www.epa.gov/sites/default/files/2020-07/documents/mwwf\\_eia\\_neshap\\_final\\_07-2015.pdf](https://www.epa.gov/sites/default/files/2020-07/documents/mwwf_eia_neshap_final_07-2015.pdf)) or "Economic Impact Analysis of Final Coke Ovens NESHAP" (U.S. EPA, 2002; [https://www.epa.gov/sites/default/files/2020-07/documents/coke-ovens\\_eia\\_neshap\\_final\\_08-2002.pdf](https://www.epa.gov/sites/default/files/2020-07/documents/coke-ovens_eia_neshap_final_08-2002.pdf)).

(16) Order, *Murray Energy Corp. v. EPA*, No. 16-1127 (D.C. Cir. April 27, 2017), ECF No. 1672987. In response to a joint motion from the parties to govern future proceedings, the D.C. Circuit issued an order in February 2021 to continue to hold the consolidated cases in *Murray Energy Corp. v. EPA* in abeyance. Order, *Murray Energy Corp. v. EPA*, No. 16-1127 (D.C. Cir. February 25, 2021), ECF No. 1887125.

(17) This finding was based on *New Jersey v. EPA*, 517 F.3d 574 (D.C. Cir. 2008), which held that the EPA is not permitted to remove source categories from the CAA section 112(c)(1) list unless the CAA section 112(c)(9) criteria for delisting have been met.

(18) CAA section 112(f)(2) requires the EPA to conduct a one-time review of the risks remaining after imposition of MACT standards under CAA section 112(d)(2) within 8 years of the effective date of those standards (risk review). CAA section 112(d)(6) requires the EPA to conduct a review of all CAA section 112(d) standards at least every 8 years to determine whether it is necessary to establish more stringent standards after considering, among other things, advances in technology and costs of additional control (technology review). The EPA has always conducted the first technology review at the same time it conducts the risk review and collectively the actions are known as RTRs.

(19) Order, *Westmoreland Mining Holdings LLC v. EPA*, No. 20-1160 (D.C. Cir. September 28, 2020), ECF No. 1863712.

(20) Order, *American Academy of Pediatrics v. Regan*, No. 20-1221 (D.C. Cir. February 16, 2021), ECF No. 1885509.

(21) National Emissions Standards for Hazardous Air Pollutants: Benzene Emissions from Maleic Anhydride Plants, Ethylbenzene/Styrene Plants, Benzene Storage Vessels, Benzene Equipment Leaks, and Coke By-Product Recovery Plants (Benzene NESHAP). 54 FR 38044 (September 14, 1989).

(22) “In protecting public health with an ample margin of safety under section 112, EPA strives to provide maximum feasible protection against risks to health from hazardous air pollutants by (1) protecting the greatest number of persons possible to an individual lifetime risk level no higher than approximately 1 in 1 million and (2) limiting to no higher than approximately 1 in 10 thousand the estimated risk that a person living near a plant would have if he or she were exposed to the maximum pollutant concentrations for 70 years.” Benzene NESHAP, 54 FR 38044-5, September 14, 1989.

(23) Congress recognized as much:

“The Administrator may take the cost of achieving the maximum emission reduction and any non-air quality health and environmental impacts and energy requirements into account when determining the emissions limitation which is achievable for the sources in the category or subcategory. Cost considerations are reflected in the selection of emissions limitations which have been achieved in practice (rather than those which are merely theoretical) by sources of a similar type or character. ”

A Legislative History of the Clean Air Act Amendments of 1990 (CAA Legislative History), Vol 5, pp. 8508 -8509 (CAA Amendments of 1989; p. 168-169; Report of the Committee on Environment and Public Works S. 1630).

(24) Our proposal focuses on an analysis of the “appropriate” prong of the CAA section 112(n)(1)(A). The *Michigan* decision and subsequent EPA actions addressing that decision have been centered on supplementing the Agency’s record with a consideration of the cost of regulation as part of the “appropriate” aspect of the overall determination. As noted, the 2020 Final Action, while reversing the 2016 Supplemental Finding as to the EPA’s determination that it was “appropriate” to regulate HAP from EGUs, did not rescind the Agency’s prior determination that it was necessary to regulate. See 84 FR 2674 (February 7, 2019) (“CAA section 112(n)(1)(A) requires the EPA to determine that both the appropriate *and* necessary prongs are met. Therefore, if the EPA finds that either prong is not satisfied, it cannot make an affirmative appropriate and necessary finding. The EPA’s reexamination of its determination . . . focuses on the first prong of that analysis.”). The “necessary” determination rested on two primary bases: (1) In 2012, the EPA determined that the hazards posed to human health and the environment by HAP emissions from EGUs would not be addressed in its future year modeling, which accounted for all CAA requirements to that point; and (2) our conclusion that the only way to ensure permanent reductions in U.S. EGU emissions of HAP and the associated risks to public health and the environment was through standards set under CAA section 112. See 76 FR 25017 (May 23, 2011). We therefore continue our focus in this proposal on reinstating the “appropriate” prong of the determination, leaving undisturbed the Agency’s prior conclusions that regulation of HAP from EGUs is “necessary.” See 65 FR 79830 (December 20, 2000); 76 FR 25017 (May 3, 2011); 77 FR 9363 (February 16, 2012).

(25) The EPA was not challenged on this interpretation in *White Stallion*.

(26) U.S. EPA. 2011. *Revised Technical Support Document: National-Scale Assessment of Mercury Risk to Populations with High Consumption of Self-caught Freshwater Fish In Support of the Appropriate and Necessary Finding for Coal- and Oil-Fired Electric Generating Units*. Office of Air Quality Planning and Standards. November. EPA-452/R-11-009. Docket ID Item No. EPA-HQ-OAR-2009-0234-19913.

(27) The EPA determined the 1-in-1 million standard was the correct metric in part because CAA section 112(c)(9)(B)(1) prohibits the EPA from removing a source category from the list if even one person is exposed to a lifetime cancer risk greater than 1-in-1 million, and CAA section 112(f)(2)(A) directs the EPA to conduct a residual risk rulemaking if even one person is exposed to a lifetime excess cancer risk greater than 1-in-1 million. See *White Stallion* at 1235-36 (agreeing it was reasonable for the EPA to consider the 1-in-1 million delisting criteria in defining “hazard to public health” under CAA section 112(n)(1)(A)).

(28) The EPA had determined it was reasonable to consider environmental impacts of HAP emissions from EGUs in the appropriate determination because CAA section 112 directs the EPA to consider impacts of HAP emissions on the environment, including in the CAA section 112(n)(1)(B) Mercury Study. See *White Stallion* at 1235-36 (agreeing it was reasonable for the EPA to consider the environmental harms when making the appropriate and necessary determination).

(29) Subsistence fishers, who by definition obtain a substantial portion of their dietary needs from self-caught fish consumption, can experience elevated levels of exposure to chemicals that bioaccumulate in fish including, in particular, methylmercury. Subsistence fishing activity can be related to a number of factors including socio-economic status (poverty) and/or cultural practices, with ethnic minorities and tribal populations often displaying increased levels of self-caught fish consumption (Burger *et al.*, 2002, Shilling *et al.*, 2010, Dellinger 2004).

Burger J, (2002). *Daily consumption of wild fish and game: exposures of high end recreationalists*. International Journal of Environmental Health Research 12:4, p. 343-354.

Shilling F, White A, Lippert L, Lubell M, (2010). *Contaminated fish consumption in California's Central Valley Delta*. Environmental Research 110, p. 334-344.

Dellinger J, (2004). *Exposure assessment and initial intervention regarding fish consumption of tribal members in the Upper Great Lakes Region in the United States*. Environmental Research 95, p. 325-340.

(30) We recognize that mercury deposition over land with subsequent impacts to agricultural-sourced food may also represent a public health concern, however as noted below, primary exposure to the U.S. population is through fish consumption.

(31) In light of the methylmercury impacts, the EPA and the Food and Drug Administration have collaborated to provide advice on eating fish and shellfish as part of a healthy eating pattern (<https://www.fda.gov/food/consumers/advice-about-eating-fish> ). In addition, states provide fish consumption advisories designed to protect the public from eating fish from waterbodies within the state that could harm their health based on local fish tissue sampling.

(35) U.S. EPA. 2002. *A Review of the Reference Dose and Reference Concentration Processes*. EPA/630/P-02/002F, December 2002.

(36) The EPA chose this risk metric in part because CAA section 112(n)(1)(C) directed the NIEHS to develop a threshold for mercury concentration in fish tissue that can be consumed by even sensitive populations without adverse effect and because CAA section 112(c)(6) demonstrates a special interest in protecting the public from exposure to mercury.

(37) The 2011 MATS RfD-based risk assessment focusing on the subsistence fisher population was designed as a screening-level analysis to inform consideration for whether U.S. EGU-sourced mercury represented a public health hazard. As such, the most appropriate risk metric was modeled exposure (for highly-exposed subsistence fishers) compared to the RfD for methylmercury. By contrast, the 2011 RIA was focused on estimating the dollar benefits associated with MATS and as such focused on a health endpoint which could be readily enumerated and then monetized, which at the time was IQ for infants born to recreational anglers.

- (48) Concentration-response functions relate levels of exposure for the chemical of interest to the probability or rate of response for the adverse health outcome in the exposed individual or population. Typically these mathematical relationships are based on data obtained either from human epidemiology studies, clinical studies, or toxicological (animal) studies. In this case, CR functions for MI-related mortality are based on epidemiology studies as discussed further below.

- (55) NHANES has not continued to collect hair-mercury data in subsequent years since the NHANES dataset referenced here. While NHANES has continued with total blood-mercury monitoring, hair mercury is a better biomarker for characterizing methylmercury exposure over time. Given that the CR functions based on the KIHD study (as well as observations presented in Roman *et al.* 2011 regarding cardio-modeling) were all based on hair-mercury, this was chosen as the anchoring analytical biometric. The potential for bias due to the use of the 1999-2000 NHANES data is further discussed in the 2021 Risk TSD.
- (56) A detailed discussion of the Mercury Maps approach (establishing a proportional relationship between mercury deposition and methylmercury concentrations in fish at the watershed level) is presented in section 1.4.6.1 of the 2011 Final Mercury TSD which in turn references: *Mercury Maps—A Quantitative Spatial Link Between Air Deposition and Fish Tissue Peer Reviewed Final Report*. U.S. EPA, Office of Water, EPA-823-R-01-009, September, 2001.
- (57) Note that while the 2011 Final Mercury TSD, in utilizing an RfD-based approach reflecting neurodevelopmental effects, focused on female subsistence fishers; the analysis focused on MI-mortality risk covers all adult subsistence fishers, and we use our cutpoint bounding analysis because there is not an RfD focused specifically on cardiovascular effects for methylmercury.
- (58) Although we have used the MI-mortality CR function described in section III.A.3.a of this preamble to generate mortality incidence estimates for the general fish consuming population ( see section III.A.3.c), this is not possible for subsistence fishers since we are not able at this point to enumerate them. Consequently, we use the confidence cutpoints associated with that CR function to identify exposures associated with MI mortality risk as described here.
- (59) Although the analysis presented here focuses on methylmercury exposure associated with fish consumption which, as noted earlier, is the primary source of methylmercury exposure for the U.S. population, EGU mercury deposited to land can also impact other food sources including those associated with agricultural production ( e.g., rice). In the context of fish consumption, commercially-sourced fish refers to fish consumed in restaurants or from food stores.
- (60) Another way of stating this is that the lower-bound estimate reflects an assumption that U.S. EGU mercury is diluted as part of a global pool and impacts commercial fish sourced from across the globe (with lower levels of methylmercury contribution) while the upper-bound estimate reflects a focus on more near-field regional impacts by U.S. EGU mercury to fish sourced either within the continental U.S. or along its coastline (with greater relative contribution to methylmercury levels).
- (61) Inclusion of 95th percentile confidence intervals for the effect estimate used in modeling MI mortality extends this range to from 3 to 143 deaths (reflecting the 5th percentile associated with the 5 lower bound estimate to the 95th percentile for the upper bound estimate of 91).
- (62) Inclusion of 95th percentile confidence intervals for the effect estimate used in modeling this endpoint extends this range to from 80 to 12,600 IQ points lost (reflecting the 5th and 95th percentiles).
- (63) Maternal exposure (and hence IQ impacts to children) from U.S. EGU-sourced mercury can display considerable variation due to (a) spatial patterns of U.S. EGU mercury fate and transport (including deposition and methylation) which affects impacts on fish methylmercury and (b) variations in fish consumption by mothers (including differences in daily intake, types of fish consumed and geographical origins of that fish).

(68) Bell, Michelle L., and Keita Ebisu. *Environmental inequality in exposures to airborne particulate matter components in the United States*. *Environmental Health Perspectives* 120.12 (2012): 1699-1704.

(69) Note that the RfD-based analysis described in the 2011 Final Mercury TSD and referenced here addressed the potential for neurodevelopmental effects in children and therefore focused on the ingestion of methylmercury by female subsistence fishers. By contrast, the analysis focusing on increased MI-mortality risk for subsistence fishers described in the 2021 Risk TSD and referenced here was broader in scope and encompassed all adult subsistence fishers.

(70) Recognizing challenges in obtaining high-end consumption rates for tribal populations active in areas of high U.S. EGU impact ( e.g., Ohio River valley, areas of the central Southeast such as northern Georgia, northern South Carolina, North Carolina and Tennessee) there is the potential for our analysis of tribal-associated risk to have missed areas of elevated U.S. EGU-sourced mercury exposure and risk. In that case, estimates simulated for other subsistence populations active in those areas ( e.g., low-income whites and Blacks in the Southeast as reported here and in Table 3 of the 2021 Risk TSD) could be representative of the ranges of risk experienced by tribal populations to the extent that cultural practices result in similar levels of increased fish consumption.

(71) U.S. EPA. *Integrated Science Assessment for Sulfur Oxides—Health Criteria* (Final Report). U.S. Environmental Protection Agency, Washington, DC, EPA/600/R-17-451, December 2017.

(72) See [https://19january2017snapshot.epa.gov/climatechange/social-cost-carbon\\_.html](https://19january2017snapshot.epa.gov/climatechange/social-cost-carbon_.html): “EPA and other federal agencies use estimates of the social cost of carbon (SC-CO<sub>2</sub>) to value the climate impacts of rulemakings. The SC-CO<sub>2</sub> is a measure, in dollars, of the long-term damage done by a ton of carbon dioxide (CO<sub>2</sub>) emissions in a given year. This dollar figure also represents the value of damages avoided for a small emission reduction ( i.e., the benefit of a CO<sub>2</sub> reduction). The SC-CO<sub>2</sub> is meant to be a comprehensive estimate of climate change damages and includes changes in net agricultural productivity, human health, property damages from increased flood risk, and changes in energy system costs, such as reduced costs for heating and increased costs for air conditioning. However, given current modeling and data limitations, it does not include all important damages.”

(73) All costs were reported in 2007 dollars.

(74) IPM, developed by ICF International, is a state-of-the-art, peer-reviewed, dynamic, deterministic linear programming model of the contiguous U.S. electric power sector. IPM provides forecasts of least-cost capacity expansion, electricity dispatch, and emission control strategies while meeting electricity demand and various environmental, transmission, dispatch, and reliability constraints. The EPA has used IPM for over 2 decades to understand power sector behavior under future business-as-usual conditions and to evaluate the economic and emission impacts of prospective environmental policies.

(75) In 2009, coal-fired generation was by far the most important source of utility scale generation, providing more power than the next two sources (natural gas and nuclear) combined. By 2016, natural gas had passed coal-fired generation as the leading source of generation in the U.S. While natural gas-fired generation, nuclear generation and renewable generation have all increased since 2009, coal-fired generation has significantly declined.

(76) Affected sources were required to be in compliance with the requirements in MATS within 3 years after the effective date of the rule ( i.e., by April 2015). However, sources were allowed to request an additional year to comply with the rule and the vast majority of sources were required to be in compliance with the rule's requirements by April 2016. We therefore think 2017 is a reasonable year in which to analyze installed controls on the EGU fleet.

- (103) As discussed above, although we attributed all controls of these types to MATS in this analysis, even those controls that were installed were likely due in part or in whole for reasons other than MATS.
- (104) For example, the sales test is often used by the EPA when evaluating potential economic impacts of regulatory actions on small entities. In the context of a small entity analysis, an evaluation of the change in profits to owners is likely the best approach to assessing the economic burden to owners from a regulatory action. Data limitations prevent solely analyzing profit changes to EGU owners as a result of MATS in this proposal.
- (105) The EPA generally uses the term “reliability” to refer to the ability to deliver the resources to the projected electricity loads so the overall power grid remains stable, and the term “resource adequacy” generally refers to the provision of adequate generating resources to meet projected load and generating reserve requirements in each region.
- (106) U.S. EPA. 2011. *Resource Adequacy and Reliability in the Integrated Planning Model Projections for the MATS Rule* (Resource Adequacy and Reliability TSD), [http://www3.epa.gov/ttn/atw/utility/revised\\_resource\\_adequacy\\_tsd.pdf](http://www3.epa.gov/ttn/atw/utility/revised_resource_adequacy_tsd.pdf), Docket ID Item No. EPA-HQ-OAR-2009-0234-19997.

(117) See, e.g., Comment Letter from Attorneys General of Massachusetts, California, Connecticut, Delaware, Illinois, Iowa, Maine, Maryland, Michigan, Minnesota, Nevada, New Jersey, New Mexico, New York, North Carolina, Oregon, Rhode Island, Vermont, Virginia, Washington, and the District of Columbia, the Maryland Department of the Environment, the City Solicitor of Baltimore, the Corporation Counsels of Chicago and New York City, the County Attorney of the County of Erie, NY, and the County Counsel for the County of Santa Clara, CA, Docket ID Item No. EPA-HQ-OAR-2018-0794-1175.

(118) See, e.g., Comment Letter from ADA Carbon Solutions, LLC, Docket ID Item No. EPA-HQ-OAR-2018-0794-0794; Comment Letter from Advanced Emissions Solutions, Inc., Docket ID Item No. EPA-HQ-OAR-2018-0794-1181; Comment Letter from Exelon Corporation, Docket ID Item No. EPA-HQ-OAR-2018-0794-1158.

(119) We use the term “formal benefit-cost analysis” to refer to an economic analysis that attempts to quantify all significant consequences of an action in monetary terms in order to determine whether an action increases economic efficiency. Assuming that all consequences can be monetized, actions with positive net benefits (i.e., benefits exceed costs) improve economic efficiency.

(120) U.S. EPA. *Integrated Science Assessment (ISA) for Particulate Matter* (Final Report, Dec 2019). U.S. Environmental Protection Agency, Washington, DC, EPA/600/R-19/188, 2019.

(121) U.S. EPA. *Integrated Science Assessment (ISA) for Ozone and Related Photochemical Oxidants* (Final Report, Apr 2020). U.S. Environmental Protection Agency, Washington, DC, EPA/600/R-20/012, 2020.

(122) U.S. EPA. 2014. *Guidelines for Preparing Economic Analyses*. EPA-240-R-10-001. National Center for Environmental Economics, Office of Policy. Washington, DC. December. Available at <https://www.epa.gov/environmental-economics/guidelines-preparing-economic-analyses>, accessed July 23, 2021. Docket ID Item No. EPA-HQ-OAR-2009-0234-20503.

(123) U.S. OMB. 2003. *Circular A-4 Guidance to Federal Agencies on Preparation of Regulatory Analysis*. Available at <https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/circulars/A4/a-4.pdf>, accessed July 23, 2021.

(124) In addition, CAA section 112(n)(1)(A) directs the EPA to evaluate the hazards to public health from EGU HAP emissions that a reasonably anticipated “after imposition of the other requirements of the [CAA].” The direction to consider the impacts of non-CAA section 112 requirements on HAP emissions from EGUs demonstrates that Congress understood that criteria pollutant controls would achieve HAP reductions. Given this understanding, it is reasonable for the EPA to consider the consequent criteria pollutant reductions attributable to CAA section 112 standards if a BCA is used to evaluate cost in the context of the appropriate finding. Furthermore, CAA section 112 legislative history not specifically directed at EGUs also supports the consideration of criteria pollutant benefits attributable to the regulation of HAP emissions. Specifically, the Senate report for the 1990 CAA amendments states: “When establishing technology-based [MACT] standards under this subsection, the Administrator may consider the benefits which result from control of air pollutants that are not listed but the emissions of which are, nevertheless, reduced by control technologies or practices necessary to meet the prescribed limitation.” A Legislative History of the Clean Air Act Amendments of 1990 (CAA Legislative History), Vol. 5, pp. 8512 (CAA Amendments of 1989; p. 172; Report of the Committee on Environment and Public Works S. 1630).

# EPA Restores California's Authority to Enforce Greenhouse Gas Emission Standards for Cars and Light Trucks

March 9, 2022

### Contact Information

EPA Press Office ([press@epa.gov](mailto:press@epa.gov))

**WASHINGTON (March 9, 2022)** – Today, EPA reinstated California's authority under the Clean Air Act to implement its own greenhouse gas (GHG) emission standards and zero emission vehicle (ZEV) sales mandate. This action concludes the agency's reconsideration of 2019's Safer Affordable Fuel-Efficient Vehicles Rule Part One: One National Program Rule (SAFE-1) by finding that the actions taken under the previous administration as a part of SAFE-1 were decided in error and are now entirely rescinded.

"Today we proudly reaffirm California's longstanding authority to lead in addressing pollution from cars and trucks," **said EPA Administrator Michael S. Regan**. "Our partnership with states to confront the climate crisis has never been more important. With today's action, we reinstate an approach that for years has helped advance clean technologies and cut air pollution for people not just in California, but for the U.S. as a whole."

With today's action, EPA is also withdrawing the SAFE-1 interpretation of the Clean Air Act that would prohibit other states from adopting the California GHG emission standards. As a result, other states may choose to adopt and enforce California's GHG emission standards in lieu of the Federal standards, consistent with section 177 of the Clean Air Act.

Content

## Action

Notification for a public meeting.

## Summary

Pursuant to the Federal Advisory Committee Act (FACA), the U.S. Environmental Protection Agency (EPA) hereby provides notice that the White House Environmental Justice Advisory Council (WHEJAC) will meet on the dates and times described below. The meeting is open to the public. Members of the public are encouraged to provide comments relevant to the beta version of the Climate and Economic Justice Screening Tool that was developed by the Council on Environmental Quality (CEQ) and comments relevant to federal government agencies' implementation of the Justice40 Initiative. For additional information about registering to attend the meetings or to provide public comment, please see “ *Registration* ” under SUPPLEMENTARY INFORMATION . Pre-registration is required.

## Dates

The WHEJAC will hold a virtual public meeting on Wednesday, March 30, 2022, and Thursday, March 31, 2022, from approximately 3:00 p.m.-7:00 p.m., Eastern Time each day. A public comment period relevant to the beta version of the Climate and Economic Justice Screening Tool and federal government agencies' implementation of the Justice40 Initiative will be considered by the WHEJAC during the meeting on March 30, 2022. (see SUPPLEMENTARY INFORMATION ). Members of the public who wish to participate during the public comment period must pre-register by 11:59 p.m., Eastern Time, March 23, 2022.

## For Further Information Contact

Karen L. Martin, WHEJAC Designated Federal Officer, U.S. EPA; email: [whejac@epa.gov](mailto:whejac@epa.gov); telephone: (202) 564-0203. Additional information about the WHEJAC is available at <https://www.epa.gov/environmentaljustice/white-house-environmental-justice-advisory-council>.

## Supplementary Information

The meeting discussion will focus on the beta version of the Climate and Economic Justice Screening Tool developed by the CEQ and WHEJAC draft recommendations on the implementation of the Justice40 Initiative. These two charges were established through Executive Order 14008, “Tackling the Climate Crisis at Home and Abroad.”

The Charter of the WHEJAC states that the advisory committee will provide independent advice and recommendations to the Chair of the CEQ and to the White House Environmental Justice Interagency Council (IAC). The WHEJAC will provide advice and recommendations about broad cross-cutting issues, related but not limited to, issues of environmental justice and pollution reduction, energy, climate change mitigation and resiliency, environmental health, and racial inequity. The WHEJAC's efforts will include a broad range of strategic, scientific, technological, regulatory, community engagement, and economic issues related to environmental justice.

*Registration:* Individual registration is required for the virtual public meeting. Information on how to register is located at <https://www.epa.gov/environmentaljustice/white-house-environmental-justice-advisory-council>. Registration for the meeting is available through the scheduled end time of the meeting. Registration to speak during the public comment period will close 11:59 p.m., Eastern Time, on March 23, 2022. When registering, please provide your name, organization, city and state, and email address for follow up. Please also indicate whether you would like to provide public comment during the meeting, and whether you are submitting written comments at the time of registration.

### A. Public Comment

The WHEJAC is interested in receiving public comments relevant to the beta version of the Climate and Economic Justice Screening Tool that was developed by the CEQ and federal government agencies' implementation of the Justice40 Initiative. Every effort will be made to hear from as many registered public commenters during the time specified on the agenda. Individuals or groups providing remarks during the public comment period will be limited to three (3) minutes. Please be prepared to briefly describe your comments and recommendations on what you want the WHEJAC to advise CEQ and IAC to do regarding the beta version of the Climate and Economic Justice Screening Tool and federal government agencies' implementation of the Justice40 Initiative. Submitting written comments for the record are strongly encouraged. You can submit your written comments in three different ways, 1. by creating comments in the Docket ID No. EPA-HQ-OA-2022-0050 at <http://www.regulations.gov>, 2. by using the webform at <https://www.epa.gov/environmentaljustice/white-house-environmental-justice-advisory-council#whejacmeeting>, and 3. by sending comments via email to [wheja@epa.gov](mailto:wheja@epa.gov). Written comments can be submitted through April 14, 2022.

### B. Information About Services for Individuals With Disabilities or Requiring English Language Translation Assistance

For information about access or services for individuals requiring assistance, please contact Karen L. Martin, via email at [whejac@epa.gov](mailto:whejac@epa.gov) or contact by phone at (202) 564-0203. To request special accommodations for a disability or other assistance, please submit your request at least seven (7) working days prior to the meeting, to give EPA sufficient time to process your request. All requests should be sent to the email listed in the FOR FURTHER INFORMATION CONTACT section.

Matthew Tejada,  
 Director for the Office of Environmental Justice.

## BRIEFING ROOM

# Executive Order on Climate-Related Financial Risk

MAY 20, 2021 • PRESIDENTIAL ACTIONS

By the authority vested in me as President by the Constitution and the laws of the United States of America, it is hereby ordered as follows:

**Section 1. Policy.** The intensifying impacts of climate change present physical risk to assets, publicly traded securities, private investments, and companies — such as increased extreme weather risk leading to supply chain disruptions. In addition, the global shift away from carbon-intensive energy sources and industrial processes presents transition risk to many companies, communities, and workers. At the same time, this global shift presents generational opportunities to enhance U.S. competitiveness and economic growth, while also creating well-paying job opportunities for workers. The failure of financial institutions to appropriately and adequately account for and measure these physical and transition risks threatens the competitiveness of U.S. companies and markets, the life savings and pensions of U.S. workers and families, and the ability of U.S. financial institutions to serve communities. In this effort, the Federal Government should lead by example by appropriately prioritizing Federal investments and conducting prudent fiscal management.

It is therefore the policy of my Administration to advance consistent, clear, intelligible, comparable, and accurate disclosure of climate-related financial risk (consistent with Executive Order 13707 of September 15, 2015 (Using Behavioral Science Insights to Better Serve the American People)), including both physical and transition risks; act to mitigate that risk and its drivers, while accounting for and addressing disparate impacts on disadvantaged communities and communities of color (consistent with Executive Order 13985 of January 20, 2021 (Advancing Racial Equity and Support for Underserved Communities Through the Federal Government)) and spurring the creation of well-paying jobs; and achieve our target of a net-zero emissions economy by no later than 2050. This policy will marshal the creativity, courage, and capital of the United States necessary to bolster the resilience of our rural and urban communities, States, Tribes, territories, and financial institutions in the face of the climate crisis, rather than exacerbate its causes, and position the United States to lead the global economy to a more prosperous and sustainable future.

Sec. 2. Climate-Related Financial Risk Strategy. The Assistant to the President for Economic Policy and Director of the National Economic Council (Director of the National Economic Council) and the Assistant to the President and National Climate Advisor (National Climate Advisor), in coordination with the Secretary of the Treasury and the Director of the Office of Management and Budget (OMB), shall develop, within 120 days of the date of this order, a comprehensive, Government-wide strategy regarding:

(a) the measurement, assessment, mitigation, and disclosure of climate-related financial risk to Federal Government programs, assets, and liabilities in order to increase the long-term stability of Federal operations;

(b) financing needs associated with achieving net-zero greenhouse gas emissions for the U.S. economy by no later than 2050, limiting global average temperature rise to 1.5 degrees Celsius, and adapting to the acute and chronic impacts of climate change; and

(c) areas in which private and public investments can play complementary roles in meeting these financing needs – while advancing economic opportunity, worker empowerment, and environmental mitigation, especially in disadvantaged communities and communities of color.

Sec. 3. Assessment of Climate-Related Financial Risk by Financial Regulators. In furtherance of the policy set forth in section 1 of this order and consistent with applicable law and subject to the availability of appropriations:

(a) The Secretary of the Treasury, as the Chair of the Financial Stability Oversight Council (FSOC), shall engage with FSOC members to consider the following actions by the FSOC:

(i) assessing, in a detailed and comprehensive manner, the climate-related financial risk, including both physical and transition risks, to the financial stability of the Federal Government and the stability of the U.S. financial system;

(ii) facilitating the sharing of climate-related financial risk data and information among FSOC member agencies and other executive departments and agencies (agencies) as appropriate;

(iii) issuing a report to the President within 180 days of the date of this order on any efforts by FSOC member agencies to integrate consideration of climate-related financial risk in their policies and programs, including a discussion of:

(A) the necessity of any actions to enhance climate-related disclosures by regulated entities to mitigate climate-related financial risk to the financial system or assets and a recommended implementation plan for taking those actions;

(B) any current approaches to incorporating the consideration of climate-related financial risk into their respective regulatory and supervisory activities and any impediments they faced in adopting those approaches;

(C) recommended processes to identify climate-related financial risk to the financial stability of the United States; and

(D) any other recommendations on how identified climate-related financial risk can be mitigated, including through new or revised regulatory standards as appropriate; and

(iv) including an assessment of climate-related financial risk in the FSOC's annual report to the Congress.

(b) The Secretary of the Treasury shall:

(i) direct the Federal Insurance Office to assess climate-related issues or gaps in the supervision and regulation of insurers, including as part of the FSOC's analysis of financial stability, and to further assess, in consultation with States, the potential for major disruptions of private insurance coverage in regions of the country particularly vulnerable to climate change impacts; and

(ii) direct the Office of Financial Research to assist the Secretary of the Treasury and the FSOC in assessing and identifying climate-related financial risk to financial stability, including the collection of data, as appropriate, and the development of research on climate-related financial risk to the U.S. financial system.

Sec. 4. Resilience of Life Savings and Pensions. In furtherance of the policy set forth in section 1 of this order and consistent with applicable law and subject to the availability of appropriations, the Secretary of Labor shall:

(a) identify agency actions that can be taken under the Employee Retirement Income Security Act of 1974 (Public Law 93-406), the Federal Employees' Retirement System Act of 1986 (Public Law 99-335), and any other relevant laws to protect the life savings and pensions of United States workers and families from the threats of climate-related financial risk;

(b) consider publishing, by September 2021, for notice and comment a proposed rule to suspend, revise, or rescind "Financial Factors in Selecting Plan Investments," 85 Fed. Reg. 72846 (November 13, 2020), and "Fiduciary Duties Regarding Proxy Voting and Shareholder Rights," 85 Fed. Reg. 81658 (December 16, 2020);

(c) assess — consistent with the Secretary of Labor's oversight responsibilities under the Federal Employees' Retirement System Act of 1986 and in consultation with the Director of the National Economic Council and the National Climate Advisor — how the Federal Retirement Thrift Investment Board has taken environmental, social, and governance factors, including climate-related financial risk, into account; and

(d) within 180 days of the date of this order, submit to the President, through the Director of the National Economic Council and the National Climate Advisor, a report on the actions taken pursuant to subsections (a), (b), and (c) of this section.

Sec. 5. Federal Lending, Underwriting, and Procurement. In furtherance of the policy set forth in section 1 of this order and consistent with applicable law and subject to the availability of appropriations:

(a) The Director of OMB and the Director of the National Economic Council, in consultation with the Secretary of the Treasury, shall develop recommendations for the National Climate Task Force on approaches related to the integration of climate-related financial risk into Federal financial management and financial reporting, especially as that risk relates to Federal lending programs. The recommendations should evaluate options to enhance accounting standards for Federal financial reporting where appropriate and should identify any opportunities to further encourage market adoption of such standards.

(b) The Federal Acquisition Regulatory Council, in consultation with the Chair of the Council on Environmental Quality and the heads of other agencies as appropriate, shall consider amending the Federal Acquisition Regulation (FAR) to:

(i) require major Federal suppliers to publicly disclose greenhouse gas emissions and climate-related financial risk and to set science-based reduction targets; and

(ii) ensure that major Federal agency procurements minimize the risk of climate change, including requiring the social cost of greenhouse gas emissions to be considered in procurement decisions and, where appropriate and feasible, give preference to bids and proposals from suppliers with a lower social cost of greenhouse gas emissions.

(c) The Secretary of Agriculture, the Secretary of Housing and Urban Development, and the Secretary of Veterans Affairs shall consider approaches to better integrate climate-related financial risk into underwriting standards, loan terms and conditions, and asset management and servicing procedures, as related to their Federal lending policies and programs.

(d) As part of the agency Climate Action Plans required by section 211 of Executive Order 14008 of January 27, 2021 (Tackling the Climate Crisis at Home and Abroad), and consistent with the interim instructions for the Climate Action Plans issued by the Federal Chief Sustainability Officer, heads of agencies must submit to the Director of OMB, the National Climate Task Force, and the Federal Chief Sustainability Officer actions to integrate climate-related financial risk into their respective agency's procurement process (subject to any changes to the FAR arising out of the Federal Acquisition Regulatory Council's review pursuant to subsection (b) of this section). The Director of OMB and the Federal Chief Sustainability Officer shall provide guidance to agencies on existing voluntary standards for use in agencies' plans.

(e) In Executive Order 13690 of January 30, 2015 (Establishing a Federal Flood Risk Management Standard and a Process for Further Soliciting and Considering Stakeholder Input), a Federal Flood Risk Management Standard (FFRMS) was established to address current and future flood risk and ensure that projects funded with taxpayer dollars last as long as intended. Subsequently, the order was revoked by Executive Order 13807 of August 15, 2017 (Establishing Discipline and Accountability in the Environmental Review and Permitting Process for Infrastructure Projects). Executive Order 13690 is hereby reinstated, thereby reestablishing the FFRMS. The "Guidelines for Implementing Executive Order 11988,

Floodplain Management, and Executive Order 13690, Establishing a Federal Flood Risk Management Standard and a Process for Further Soliciting and Considering Stakeholder Input” of October 8, 2015, were never revoked and thus remain in effect.

Sec. 6. Long-Term Budget Outlook. The Federal Government has broad exposure to increased costs and lost revenue as a result of the impacts of unmitigated climate change. In furtherance of the policy set forth in section 1 of this order and consistent with applicable law and subject to the availability of appropriations:

(a) The Director of OMB, in consultation with the Secretary of the Treasury, the Chair of the Council of Economic Advisers, the Director of the National Economic Council, and the National Climate Advisor, shall identify the primary sources of Federal climate-related financial risk exposure and develop methodologies to quantify climate risk within the economic assumptions and the long-term budget projections of the President’s Budget;

(b) The Director of OMB and the Chair of the Council of Economic Advisers, in consultation with the Director of the National Economic Council, the National Climate Advisor, and the heads of other agencies as appropriate, shall develop and publish annually, within the President’s Budget, an assessment of the Federal Government’s climate risk exposure; and

(c) The Director of OMB shall improve the accounting of climate-related Federal expenditures, where appropriate, and reduce the Federal Government’s long-term fiscal exposure to climate-related financial risk through formulation of the President’s Budget and oversight of budget execution.

Sec. 7. General Provisions. (a) Nothing in this order shall be construed to impair or otherwise affect:

(i) the authority granted by law to an executive department or agency, or the head thereof; or

(ii) the functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.

(b) This order shall be implemented consistent with applicable law and subject to the availability of appropriations.

(c) This order is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

JOSEPH R. BIDEN JR.

THE WHITE HOUSE,  
May 20, 2021.

## BRIEFING ROOM

# Executive Order on Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis

JANUARY 20, 2021 • PRESIDENTIAL ACTIONS

By the authority vested in me as President by the Constitution and the laws of the United States of America, it is hereby ordered as follows:

**Section 1. Policy.** Our Nation has an abiding commitment to empower our workers and communities; promote and protect our public health and the environment; and conserve our national treasures and monuments, places that secure our national memory. Where the Federal Government has failed to meet that commitment in the past, it must advance environmental justice. In carrying out this charge, the Federal Government must be guided by the best science and be protected by processes that ensure the integrity of Federal decision-making. It is, therefore, the policy of my Administration to listen to the science; to improve public health and protect our environment; to ensure access to clean air and water; to limit exposure to dangerous chemicals and pesticides; to hold polluters accountable, including those who disproportionately harm communities of color and low-income communities; to reduce greenhouse gas emissions; to bolster resilience to the impacts of climate change; to restore and expand our national treasures and monuments; and to prioritize both environmental justice and the creation of the well-paying union jobs necessary to deliver on these goals.

To that end, this order directs all executive departments and agencies (agencies) to immediately review and, as appropriate and consistent with applicable law, take action to address the promulgation of Federal regulations and other actions during the last 4 years that conflict with these important national objectives, and to immediately commence work to confront the climate crisis.

**Sec. 2. Immediate Review of Agency Actions Taken Between January 20, 2017, and January 20, 2021.** (a) The heads of all agencies shall immediately review all existing regulations, orders, guidance documents, policies, and any other similar agency actions (agency actions) promulgated, issued, or adopted between January 20, 2017, and January 20, 2021, that are or may be inconsistent with, or present obstacles to, the policy set forth in

section 1 of this order. For any such actions identified by the agencies, the heads of agencies shall, as appropriate and consistent with applicable law, consider suspending, revising, or rescinding the agency actions. In addition, for the agency actions in the 4 categories set forth in subsections (i) through (iv) of this section, the head of the relevant agency, as appropriate and consistent with applicable law, shall consider publishing for notice and comment a proposed rule suspending, revising, or rescinding the agency action within the time frame specified.

(i) Reducing Methane Emissions in the Oil and Gas Sector: “Oil and Natural Gas Sector: Emission Standards for New, Reconstructed, and Modified Sources Reconsideration,” 85 Fed. Reg. 57398 (September 15, 2020), by September 2021.

(ii) Establishing Ambitious, Job-Creating Fuel Economy Standards: “The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program,” 84 Fed. Reg. 51310 (September 27, 2019), by April 2021; and “The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021–2026 Passenger Cars and Light Trucks,” 85 Fed. Reg. 24174 (April 30, 2020), by July 2021. In considering whether to propose suspending, revising, or rescinding the latter rule, the agency should consider the views of representatives from labor unions, States, and industry.

(iii) Job-Creating Appliance- and Building-Efficiency Standards: “Energy Conservation Program for Appliance Standards: Procedures for Use in New or Revised Energy Conservation Standards and Test Procedures for Consumer Products and Commercial/Industrial Equipment,” 85 Fed. Reg. 8626 (February 14, 2020), with major revisions proposed by March 2021 and any remaining revisions proposed by June 2021; “Energy Conservation Program for Appliance Standards: Procedures for Evaluating Statutory Factors for Use in New or Revised Energy Conservation Standards,” 85 Fed. Reg. 50937 (August 19, 2020), with major revisions proposed by March 2021 and any remaining revisions proposed by June 2021; “Final Determination Regarding Energy Efficiency Improvements in the 2018 International Energy Conservation Code (IECC),” 84 Fed. Reg. 67435 (December 10, 2019), by May 2021; “Final Determination Regarding Energy Efficiency Improvements in ANSI/ASHRAE/IES Standard 90.1-2016: Energy Standard for Buildings, Except Low-Rise Residential Buildings,” 83 Fed. Reg. 8463 (February 27, 2018), by May 2021.

(iv) Protecting Our Air from Harmful Pollution: “National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units—Reconsideration of Supplemental Finding and Residual Risk and Technology Review,” 85 Fed. Reg. 31286 (May 22, 2020), by August 2021; “Increasing Consistency and Transparency in Considering Benefits and Costs in the Clean Air Act Rulemaking Process,” 85 Fed. Reg. 84130 (December 23, 2020), as

soon as possible; “Strengthening Transparency in Pivotal Science Underlying Significant Regulatory Actions and Influential Scientific Information,” 86 Fed. Reg. 469 (January 6, 2021), as soon as possible.

(b) Within 30 days of the date of this order, heads of agencies shall submit to the Director of the Office of Management and Budget (OMB) a preliminary list of any actions being considered pursuant to section (2)(a) of this order that would be completed by December 31, 2021, and that would be subject to OMB review. Within 90 days of the date of this order, heads of agencies shall submit to the Director of OMB an updated list of any actions being considered pursuant to section (2)(a) of this order that would be completed by December 31, 2025, and that would be subject to OMB review. At the time of submission to the Director of OMB, heads of agencies shall also send each list to the National Climate Advisor. In addition, and at the same time, heads of agencies shall send to the National Climate Advisor a list of additional actions being considered pursuant to section (2)(a) of this order that would not be subject to OMB review.

(c) Heads of agencies shall, as appropriate and consistent with applicable law, consider whether to take any additional agency actions to fully enforce the policy set forth in section 1 of this order. With respect to the Administrator of the Environmental Protection Agency, the following specific actions should be considered:

(i) proposing new regulations to establish comprehensive standards of performance and emission guidelines for methane and volatile organic compound emissions from existing operations in the oil and gas sector, including the exploration and production, transmission, processing, and storage segments, by September 2021; and

(ii) proposing a Federal Implementation Plan in accordance with the Environmental Protection Agency’s “Findings of Failure To Submit State Implementation Plan Revisions in Response to the 2016 Oil and Natural Gas Industry Control Techniques Guidelines for the 2008 Ozone National Ambient Air Quality Standards (NAAQS) and for States in the Ozone Transport Region,” 85 Fed. Reg. 72963 (November 16, 2020), for California, Connecticut, New York, Pennsylvania, and Texas by January 2022.

(d) The Attorney General may, as appropriate and consistent with applicable law, provide notice of this order and any actions taken pursuant to section 2(a) of this order to any court with jurisdiction over pending litigation related to those agency actions identified pursuant to section (2)(a) of this order, and may, in his discretion, request that the court stay or otherwise dispose of litigation, or seek other appropriate relief consistent with this order, until the completion of the processes described in this order.

(e) In carrying out the actions directed in this section, heads of agencies shall seek input from the public and stakeholders, including State local, Tribal, and territorial officials, scientists, labor unions, environmental advocates, and environmental justice organizations.

**Sec. 3. Restoring National Monuments.** (a) The Secretary of the Interior, as appropriate and consistent with applicable law, including the Antiquities Act, 54 U.S.C. 320301 *et seq.*, shall, in consultation with the Attorney General, the Secretaries of Agriculture and Commerce, the Chair of the Council on Environmental Quality, and Tribal governments, conduct a review of the monument boundaries and conditions that were established by Proclamation 9681 of December 4, 2017 (Modifying the Bears Ears National Monument); Proclamation 9682 of December 4, 2017 (Modifying the Grand Staircase-Escalante National Monument); and Proclamation 10049 of June 5, 2020 (Modifying the Northeast Canyons and Seamounts Marine National Monument), to determine whether restoration of the monument boundaries and conditions that existed as of January 20, 2017, would be appropriate.

(b) Within 60 days of the date of this order, the Secretary of the Interior shall submit a report to the President summarizing the findings of the review conducted pursuant to subsection (a), which shall include recommendations for such Presidential actions or other actions consistent with law as the Secretary may consider appropriate to carry out the policy set forth in section 1 of this order.

(c) The Attorney General may, as appropriate and consistent with applicable law, provide notice of this order to any court with jurisdiction over pending litigation related to the Grand Staircase-Escalante, Bears Ears, and Northeast Canyons and Seamounts Marine National Monuments, and may, in his discretion, request that the court stay the litigation or otherwise delay further litigation, or seek other appropriate relief consistent with this order, pending the completion of the actions described in subsection (a) of this section.

**Sec. 4. Arctic Refuge.** (a) In light of the alleged legal deficiencies underlying the program, including the inadequacy of the environmental review required by the National Environmental Policy Act, the Secretary of the Interior shall, as appropriate and consistent with applicable law, place a temporary moratorium on all activities of the Federal Government relating to the implementation of the Coastal Plain Oil and Gas Leasing Program, as established by the Record of Decision signed August 17, 2020, in the Arctic National Wildlife Refuge. The Secretary shall review the program and, as appropriate and consistent with applicable law, conduct a new, comprehensive analysis of the potential environmental impacts of the oil and gas program.

(b) In Executive Order 13754 of December 9, 2016 (Northern Bering Sea Climate Resilience), and in the Presidential Memorandum of December 20, 2016 (Withdrawal of Certain Portions of

the United States Arctic Outer Continental Shelf From Mineral Leasing), President Obama withdrew areas in Arctic waters and the Bering Sea from oil and gas drilling and established the Northern Bering Sea Climate Resilience Area. Subsequently, the order was revoked and the memorandum was amended in Executive Order 13795 of April 28, 2017 (Implementing an America-First Offshore Energy Strategy). Pursuant to section 12(a) of the Outer Continental Shelf Lands Act, 43 U.S.C. 1341(a), Executive Order 13754 and the Presidential Memorandum of December 20, 2016, are hereby reinstated in their original form, thereby restoring the original withdrawal of certain offshore areas in Arctic waters and the Bering Sea from oil and gas drilling.

(c) The Attorney General may, as appropriate and consistent with applicable law, provide notice of this order to any court with jurisdiction over pending litigation related to the Coastal Plain Oil and Gas Leasing Program in the Arctic National Wildlife Refuge and other related programs, and may, in his discretion, request that the court stay the litigation or otherwise delay further litigation, or seek other appropriate relief consistent with this order, pending the completion of the actions described in subsection (a) of this section.

**Sec. 5. Accounting for the Benefits of Reducing Climate Pollution.** (a) It is essential that agencies capture the full costs of greenhouse gas emissions as accurately as possible, including by taking global damages into account. Doing so facilitates sound decision-making, recognizes the breadth of climate impacts, and supports the international leadership of the United States on climate issues. The “social cost of carbon” (SCC), “social cost of nitrous oxide” (SCN), and “social cost of methane” (SCM) are estimates of the monetized damages associated with incremental increases in greenhouse gas emissions. They are intended to include changes in net agricultural productivity, human health, property damage from increased flood risk, and the value of ecosystem services. An accurate social cost is essential for agencies to accurately determine the social benefits of reducing greenhouse gas emissions when conducting cost-benefit analyses of regulatory and other actions.

(b) There is hereby established an Interagency Working Group on the Social Cost of Greenhouse Gases (the “Working Group”). The Chair of the Council of Economic Advisers, Director of OMB, and Director of the Office of Science and Technology Policy shall serve as Co-Chairs of the Working Group.

(i) Membership. The Working Group shall also include the following other officers, or their designees: the Secretary of the Treasury; the Secretary of the Interior; the Secretary of Agriculture; the Secretary of Commerce; the Secretary of Health and Human Services; the Secretary of Transportation; the Secretary of Energy; the Chair of the Council on Environmental Quality; the Administrator of the Environmental Protection Agency; the

Assistant to the President and National Climate Advisor; and the Assistant to the President for Economic Policy and Director of the National Economic Council.

(ii) Mission and Work. The Working Group shall, as appropriate and consistent with applicable law:

(A) publish an interim SCC, SCN, and SCM within 30 days of the date of this order, which agencies shall use when monetizing the value of changes in greenhouse gas emissions resulting from regulations and other relevant agency actions until final values are published;

(B) publish a final SCC, SCN, and SCM by no later than January 2022;

(C) provide recommendations to the President, by no later than September 1, 2021, regarding areas of decision-making, budgeting, and procurement by the Federal Government where the SCC, SCN, and SCM should be applied;

(D) provide recommendations, by no later than June 1, 2022, regarding a process for reviewing, and, as appropriate, updating, the SCC, SCN, and SCM to ensure that these costs are based on the best available economics and science; and

(E) provide recommendations, to be published with the final SCC, SCN, and SCM under subparagraph (A) if feasible, and in any event by no later than June 1, 2022, to revise methodologies for calculating the SCC, SCN, and SCM, to the extent that current methodologies do not adequately take account of climate risk, environmental justice, and intergenerational equity.

(iii) Methodology. In carrying out its activities, the Working Group shall consider the recommendations of the National Academies of Science, Engineering, and Medicine as reported in Valuing Climate Damages: Updating Estimation of the Social Cost of Carbon Dioxide (2017) and other pertinent scientific literature; solicit public comment; engage with the public and stakeholders; seek the advice of ethics experts; and ensure that the SCC, SCN, and SCM reflect the interests of future generations in avoiding threats posed by climate change.

**Sec. 6. Revoking the March 2019 Permit for the Keystone XL Pipeline.** (a) On March 29, 2019, the President granted to TransCanada Keystone Pipeline, L.P. a Presidential permit (the “Permit”) to construct, connect, operate, and maintain pipeline facilities at the international border of the United States and Canada (the “Keystone XL pipeline”), subject to express conditions and potential revocation in the President’s sole discretion. The Permit is hereby revoked in accordance with Article 1(1) of the Permit.

(b) In 2015, following an exhaustive review, the Department of State and the President determined that approving the proposed Keystone XL pipeline would not serve the U.S. national interest. That analysis, in addition to concluding that the significance of the proposed pipeline for our energy security and economy is limited, stressed that the United States must prioritize the development of a clean energy economy, which will in turn create good jobs. The analysis further concluded that approval of the proposed pipeline would undermine U.S. climate leadership by undercutting the credibility and influence of the United States in urging other countries to take ambitious climate action.

(c) Climate change has had a growing effect on the U.S. economy, with climate-related costs increasing over the last 4 years. Extreme weather events and other climate-related effects have harmed the health, safety, and security of the American people and have increased the urgency for combatting climate change and accelerating the transition toward a clean energy economy. The world must be put on a sustainable climate pathway to protect Americans and the domestic economy from harmful climate impacts, and to create well-paying union jobs as part of the climate solution.

(d) The Keystone XL pipeline disserves the U.S. national interest. The United States and the world face a climate crisis. That crisis must be met with action on a scale and at a speed commensurate with the need to avoid setting the world on a dangerous, potentially catastrophic, climate trajectory. At home, we will combat the crisis with an ambitious plan to build back better, designed to both reduce harmful emissions and create good clean-energy jobs. Our domestic efforts must go hand in hand with U.S. diplomatic engagement. Because most greenhouse gas emissions originate beyond our borders, such engagement is more necessary and urgent than ever. The United States must be in a position to exercise vigorous climate leadership in order to achieve a significant increase in global climate action and put the world on a sustainable climate pathway. Leaving the Keystone XL pipeline permit in place would not be consistent with my Administration's economic and climate imperatives.

**Sec. 7. Other Revocations.** (a) Executive Order 13766 of January 24, 2017 (Expediting Environmental Reviews and Approvals For High Priority Infrastructure Projects), Executive Order 13778 of February 28, 2017 (Restoring the Rule of Law, Federalism, and Economic Growth by Reviewing the "Waters of the United States" Rule), Executive Order 13783 of March 28, 2017 (Promoting Energy Independence and Economic Growth), Executive Order 13792 of April 26, 2017 (Review of Designations Under the Antiquities Act), Executive Order 13795 of April 28, 2017 (Implementing an America-First Offshore Energy Strategy), Executive Order 13868 of April 10, 2019 (Promoting Energy Infrastructure and Economic Growth), and Executive Order 13927 of June 4, 2020 (Accelerating the Nation's Economic Recovery from the COVID-19 Emergency by Expediting Infrastructure Investments and Other Activities), are

hereby revoked. Executive Order 13834 of May 17, 2018 (Efficient Federal Operations), is hereby revoked except for sections 6, 7, and 11.

(b) Executive Order 13807 of August 15, 2017 (Establishing Discipline and Accountability in the Environmental Review and Permitting Process for Infrastructure Projects), is hereby revoked. The Director of OMB and the Chair of the Council on Environmental Quality shall jointly consider whether to recommend that a replacement order be issued.

(c) Executive Order 13920 of May 1, 2020 (Securing the United States Bulk-Power System), is hereby suspended for 90 days. The Secretary of Energy and the Director of OMB shall jointly consider whether to recommend that a replacement order be issued.

(d) The Presidential Memorandum of April 12, 2018 (Promoting Domestic Manufacturing and Job Creation Policies and Procedures Relating to Implementation of Air Quality Standards), the Presidential Memorandum of October 19, 2018 (Promoting the Reliable Supply and Delivery of Water in the West), and the Presidential Memorandum of February 19, 2020 (Developing and Delivering More Water Supplies in California), are hereby revoked.

(e) The Council on Environmental Quality shall rescind its draft guidance entitled, “Draft National Environmental Policy Act Guidance on Consideration of Greenhouse Gas Emissions,” 84 Fed. Reg. 30097 (June 26, 2019). The Council, as appropriate and consistent with applicable law, shall review, revise, and update its final guidance entitled, “Final Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in National Environmental Policy Act Reviews,” 81 Fed. Reg. 51866 (August 5, 2016).

(f) The Director of OMB and the heads of agencies shall promptly take steps to rescind any orders, rules, regulations, guidelines, or policies, or portions thereof, including, if necessary, by proposing such rescissions through notice-and-comment rulemaking, implementing or enforcing the Executive Orders, Presidential Memoranda, and draft guidance identified in this section, as appropriate and consistent with applicable law.

**Sec. 8. General Provisions.** (a) Nothing in this order shall be construed to impair or otherwise affect:

- (i) the authority granted by law to an executive department or agency, or the head thereof; or
- (ii) the functions of the Director of the Office of Management and Budget relating to budgetary, administrative, or legislative proposals.

(b) This order shall be implemented in a manner consistent with applicable law and subject to the availability of appropriations.

(c) This order is not intended to, and does not, create any right or benefit, substantive or procedural, enforceable at law or in equity by any party against the United States, its departments, agencies, or entities, its officers, employees, or agents, or any other person.

JOSEPH R. BIDEN JR.

THE WHITE HOUSE,  
January 20, 2021.

## BRIEFING ROOM

# FACT SHEET: President Biden Announces Steps to Drive American Leadership Forward on Clean Cars and Trucks

AUGUST 05, 2021 • STATEMENTS AND RELEASES

## *President Biden Outlines Target of 50% Electric Vehicle Sales Share in 2030 to Unleash Full Economic Benefits of Build Back Better Agenda and Advance Smart Fuel Efficiency and Emission Standards*

President Biden's Build Back Better Agenda and the Bipartisan Infrastructure Deal invest in the infrastructure, manufacturing, and incentives that we need to grow good-paying, union jobs at home, lead on electric vehicles around the world, and save American consumers money. Today, the President will announce a set of new actions aimed at advancing these goals and increasing the impact of his proposed Build Back Better investments – positioning America to drive the electric vehicle future forward, outcompete China, and tackle the climate crisis.

Specifically, the President will sign an Executive Order that sets an ambitious new target to make half of all new vehicles sold in 2030 zero-emissions vehicles, including battery electric, plug-in hybrid electric, or fuel cell electric vehicles. The Executive Order also kicks off development of long-term fuel efficiency and emissions standards to save consumers money, cut pollution, boost public health, advance environmental justice, and tackle the climate crisis.

In addition, and consistent with the President's Day One Executive Order, the Environmental Protection Agency (EPA) and U.S. Department of Transportation (USDOT) will announce how they are addressing the previous administration's harmful rollbacks of near-term fuel efficiency and emissions standards. Through these coordinated notices of proposed rulemaking, the two agencies are advancing smart fuel efficiency and emissions standards that would deliver around \$140 billion in net benefits over the life of the program, save about 200 billion gallons of gasoline, and reduce around two billion metric tons of carbon pollution. For the average consumer, this means net benefits of up to \$900 over the life of the vehicle in fuel savings.

These new actions – paired with the investments in the President's Build Back Better Agenda –

will strengthen American leadership in clean cars and trucks by accelerating innovation and manufacturing in the auto sector, bolstering the auto sector domestic supply chain, and growing auto jobs with good pay and benefits. That is why today, American automakers Ford, GM, and Stellantis and the United Auto Workers (UAW), will stand with President Biden at the White House with aligned ambition: supporting the President's Build Back Better Agenda and the automakers' need to invest in and grow good-paying union jobs in the United States.

### *Build Back Better Investment Agenda*

The global market is shifting to electric vehicles and tapping their potential to save families money, lower pollution, and make the air we breathe cleaner. Despite pioneering the technology, the U.S. is behind in the race to manufacture these vehicles and the batteries that go in them. Today, the U.S. market share of electric vehicle sales is only one-third that of the Chinese electric vehicle market. The President believes it is time for the U.S. to lead in electric vehicle manufacturing, infrastructure, and innovation, by investing in:

- Installing the first-ever national network of electric vehicle charging stations.
- Delivering point-of-sale consumer incentives to spur U.S. manufacturing and union jobs.
- Financing the retooling and expansion of the full domestic manufacturing supply chain.
- Innovating the next generation of clean technologies to maintain our competitive edge.

Through the investments in the Build Back Better Agenda and Bipartisan Infrastructure Deal, we can strengthen U.S. leadership in electric vehicles and batteries. These once-in-a-generation investments will position America to win the future of transportation and manufacturing and create good-paying, union jobs, dramatically expand American manufacturing, make electric vehicles more affordable for families, and export our electric vehicles around the world.

And, the President has already made a down payment on his vision for U.S. leadership in auto manufacturing. Last month, the Department of Commerce announced \$3 billion in currently available American Rescue Plan funds that can be used to advance the domestic electric vehicle industry in communities that have historically been the backbone of our auto industry.

### *Electric Vehicles Ambition for 2030*

Over the last decade, we have seen a transformation in the technology costs, performance, and availability of electric vehicles. Since 2010:

- Battery pack costs dropped by 85 percent, paving the way to sticker price parity with gasoline-powered vehicles.
- Average vehicle range increased dramatically as charging times shortened.
- Electric models available to U.S. consumers expanded to over 40 last year – and growing.

Seeing this shift, countries are sprinting to lead. For example, China is increasingly cornering the global supply chain for electric vehicles and batteries with its fast-growing electric vehicle market. By setting clear targets for electric vehicle sale trajectories, these countries are becoming magnets for private investment into their manufacturing sectors – from parts and materials to final assembly.

President Biden is committed to changing that and delivering for the American people. That is why he will sign an Executive Order that sets a new target of electric vehicles representing half of new vehicles sold in 2030. This builds on the announcements today from automakers, representing nearly the entire U.S. auto market who have positioned around the goal of reaching 40 to 50 percent electric vehicle sales share in 2030. More than a deployment target, it is a goal to leverage once-in-generation investments and a whole-of-government effort to lift up the American autoworker and strengthen American leadership in clean cars and trucks. The 2030 target is calibrated to provide time for existing manufacturing facilities to upgrade without stranding assets, upgrades that will be catalyzed by the Build Back Better Agenda, and lean into a path that expands domestic U.S. manufacturing with union workers.

### *Smart Fuel Efficiency and Emissions Standards*

Consistent with the President's Day One Executive Order, the Environmental Protection Agency (EPA) and U.S. Department of Transportation's National Highway Traffic Safety Administration (NHTSA) will announce how they are addressing the previous administration's harmful rollbacks of near-term fuel efficiency and emissions standards. The two agencies' standards work in a compatible fashion through model year 2026, with the NHTSA proposed rule starting in model year 2024 and the EPA proposed rule taking effect a year sooner with model year 2023. The standards build on the momentum from "California Framework Agreement" – an agreement between the State of California and five automakers: Ford, Honda, Volkswagen Group, BMW, and Volvo.

Through these coordinated notices of proposed rulemaking, the two agencies are advancing smart fuel efficiency and emissions standards that would deliver around \$140 billion in net benefits over the life of the standards, including asthma attacks avoided and lives saved, save

about 200 billion gallons of gasoline, and reduce around two billion metric tons of carbon pollution. For the average consumer, this means net savings of up to \$900 over the life of the vehicle from fuel savings.

Building on these near-term steps, the Executive Order that the President will sign kicks off development of long-term fuel efficiency and emissions standards to save consumers money, cut pollution, boost public health, advance environmental justice, and tackle the climate crisis. Specifically, the Executive Order lays out a robust schedule for development of fuel efficiency and multi-pollutant emissions standards through at least model year 2030 for light-duty vehicles and for medium- and heavy-duty vehicles starting as early as model year 2027. The Executive Order also directs agencies to:

- Consult with the Secretaries of Commerce, Labor, and Energy on ways to accelerate innovation and manufacturing in the automotive sector, to strengthen the domestic supply chain for that sector, and to grow jobs that provide good pay and benefits.
- Engage with California and other states leading the way in reducing vehicle emissions.
- Secure input from a diverse range of stakeholders, including representatives from labor unions, industry, environmental justice organizations, and public health experts.

Together, today's announcements would put us on track to reduce greenhouse gas emissions from new passenger vehicle sales by more than 60 percent in 2030 compared to vehicles sold last year, and facilitate achieving the President's goal of 50-52 percent net economy-wide greenhouse gas emission reductions below 2005 levels in 2030.

###

## BRIEFING ROOM

# FACT SHEET: President Biden Signs Executive Order Catalyzing America's Clean Energy Economy Through Federal Sustainability

DECEMBER 08, 2021 • STATEMENTS AND RELEASES

## *U.S. Government Will Lead by Example to Leverage Scale and Procurement Power to Drive Clean, Healthy, and Resilient Operations*

Today, President Biden will sign an executive order that demonstrates how the United States will leverage its scale and procurement power to lead by example in tackling the climate crisis. The executive order will reduce emissions across federal operations, invest in American clean energy industries and manufacturing, and create clean, healthy, and resilient communities. The President is building on his whole-of-government effort to tackle the climate crisis in a way that creates well-paying jobs, grows industries, and makes the country more economically competitive.

The President's executive order directs the federal government to use its scale and procurement power to achieve five ambitious goals:

- 100 percent carbon pollution-free electricity (CFE) by 2030, at least half of which will be locally supplied clean energy to meet 24/7 demand;
- 100 percent zero-emission vehicle (ZEV) acquisitions by 2035, including 100 percent zero-emission light-duty vehicle acquisitions by 2027;
- Net-zero emissions from federal procurement no later than 2050, including a Buy Clean policy to promote use of construction materials with lower embodied emissions;
- A net-zero emissions building portfolio by 2045, including a 50 percent emissions reduction by 2032; and
- Net-zero emissions from overall federal operations by 2050, including a 65 percent emissions reduction by 2030.

In addition to the five new commitments that form the pillars of today's executive action, the President also directed the federal government to orient its procurement and operations efforts in line with the following principles and goals:

- Achieving climate resilient infrastructure and operations;
- Building a climate- and sustainability-focused workforce;
- Advancing environmental justice and equity;
- Prioritizing the purchase of sustainable products, such as products without added perfluoroalkyl or polyfluoroalkyl substances (PFAS); and
- Accelerating progress through domestic and international partnerships.

Today's executive action is a part of the President's broader commitment to increasing investments in America's manufacturing industries and workers to build back our country better. By transforming how the federal government builds, buys, and manages its assets and operations, the federal government will support the growth of America's clean energy and clean technology industries, while accelerating America's progress toward achieving a carbon pollution-free electricity sector by 2035.

President Biden's executive order demonstrates how the United States government will lead by example to provide a strong foundation for American businesses to compete and win globally in the clean energy economy while creating well paying, union jobs at home. Today's executive action further reinforces the President's directive to Buy American and ensure that equity and environmental justice are key considerations in federal operations planning and decision making.

The White House also released a detailed description of this plan: *The Federal Sustainability Plan: Catalyzing America's Clean Energy Industries and Creating Jobs Through Federal Sustainability*.

**Together, the President's Bipartisan Infrastructure Law, Budget for Fiscal Year 2022, and Build Back Better Act will provide agencies with the funding necessary to achieve the goals of the executive order.**

**Catalyzing America's Clean Energy Industries and Jobs through Federal Sustainability Executive Order**

Through this executive order, the federal government will transform its portfolio of 300,000 buildings, fleet of 600,000 cars and trucks, and annual purchasing power of \$650 billion in goods and services to:

1. Transition federal infrastructure to zero-emission vehicles and buildings powered by carbon pollution-free electricity, which will reduce the federal government's greenhouse gas emissions by 65 percent by 2030 and achieve net-zero emissions by 2050.
- Make federal agencies more adaptive and resilient to the impacts of climate change, and increase the sustainability of federal supply chains, achieving net-zero emissions from federal procurement by 2050.
  - Mainstream sustainability within the federal workforce, advance equity and environmental justice, and leverage partnerships to accelerate progress.

**Transition federal infrastructure to zero-emission vehicles and energy efficient buildings powered by carbon pollution-free electricity:**

- **Achieve 100 percent carbon pollution-free electricity use by 2030, including 50 percent on a 24/7 basis.** The federal government will work with utilities, developers, technology firms, financiers and others to purchase electricity produced from resources that generate no carbon emissions, including solar and wind, for all its operations by 2030. Half of the federal government's 100 percent carbon pollution-free annual electricity demand will be procured on a 24/7 basis, meaning that the federal government's real-time demand for electricity will be met with clean energy every hour, every day, and produced within the same regional grid where the electricity is consumed. With the scope and scale of this electricity demand, the federal government expects it will catalyze the development of at least 10 gigawatts of new American clean electricity production by 2030, spurring the creation of new union jobs and moving the country closer to achieving a carbon pollution-free electricity sector by 2035.
- **Transition to 100 percent acquisition of zero-emission vehicles by 2035 for the federal vehicle fleet, including 100 percent light duty vehicle acquisition by 2027.** The federal government will work with American vehicle, battery, and charging equipment manufacturers and installers to transform its fleet into the largest zero-emission vehicle fleet in the Nation, reaching 100 percent zero-emission vehicle acquisitions by 2035. This will accelerate the advancement of America's industrial capacity to supply zero-emission vehicles and electric vehicle batteries and create and sustain good union jobs in manufacturing, engineering, and skilled-trades.

- **Modernize the federal buildings portfolio to reach net-zero emissions by 2045, including a 50 percent reduction in building emissions by 2032.** The federal government will work across existing real property and during new building construction and major renovations to increase water and energy efficiency, reduce waste, electrify systems, and promote sustainable locations for federal facilities to strengthen the vitality and livability of the communities in which federal facilities are located. Additionally, the Biden-Harris Administration will implement the first-ever Federal Building Performance Standard, and will use performance contracting to improve buildings with no up-front costs.

**Make federal agencies more adaptive and resilient to the impacts of climate change, and increase the sustainability of federal supply chains, achieving net-zero emissions from federal procurement by 2050.**

- **Make federal agencies more adaptive and resilient to the impacts of climate change.** The intensifying impacts of climate change present physical, operational, and financial risks to federal infrastructure, agency missions, and our services to the American people. Agencies will implement the actions identified through their [October 7, 2021, Climate Adaptation and Resilience Plans](#) and modernize federal policy, programs, operations, and infrastructure to support climate resilience investment. By taking action now to better manage and mitigate climate risks, we will minimize future disruptions and destruction to federal operations, assets, and programs and ensure the federal government can continue providing critical services to the Nation.
- **Increase the sustainability of federal supply chains, achieving net-zero emissions from federal procurement by 2050.** The companies that supply the federal government are critical partners in achieving our climate goals and growing the economy and American jobs. Cutting emissions from the federal government's procurement also means buying materials with a lower carbon footprint. The federal government will launch a "buy clean" initiative for low-carbon materials and prioritize the purchase of sustainable products, such as products without added perfluoroalkyl or polyfluoroalkyl substances (PFAS). Through these actions, the federal government will provide a large and stable signal to the market for sustainable and low-carbon goods made in America, advancing America's industrial capacity to supply the goods and materials of the future while growing good jobs for American workers.

**Mainstream sustainability within the federal workforce, advance equity and environmental justice, and leverage partnerships to accelerate progress.**

- **Mainstream sustainability within the federal workforce.** The federal government's 4.2 million employees are critical stakeholders and leaders in the shift to sustainable and resilient operations. The federal government will build capacity through engagement, education, and training so that federal workers are ready to embed sustainability, climate adaptation, and environmental stewardship analysis and action in their jobs as we work to Build Back Better.
- **Advance equity and environmental justice.** The federal government will advance the goals of the Administration's Justice40 Initiative by ensuring that economic equity and environmental justice are key considerations in operations planning and decision making. A federal environmental justice representative will serve on the newly established Chief Sustainability Officer Council. To incorporate equity, agencies will implement this executive order consistent with the President's Executive Order on *Advancing Racial Equity and Support for Underserved Communities Through the Federal Government*, which helps ensure that government contracting and procurement opportunities are available on an equal basis.
- Collaboration with leading American unions, businesses, States, Tribes, municipalities, and other countries will accelerate progress and catalyze greater climate action at home and abroad. The federal government will build upon its newly launched Greening Government Initiative, which convenes governments around the world to collaborate on greening government operations. Further, the Administration will launch a Presidential Sustainability Executives Program, placing senior leaders from the private and non-profit sectors to serve across the federal government, bringing innovative perspectives and critical expertise to achieve these ambitious, and imperative, sustainability and climate preparedness goals.

### **Actions Agencies are Taking to Meet the Goals of the Sustainability Executive Order**

Across the federal government, agencies are moving expeditiously to meet the President's call for action and are positioned to meet the ambitious goals of his executive order and Federal Sustainability Plan. Highlights are included below:

#### **100 percent CFE by 2030, including 50 percent on a 24/7 Basis**

- In 2022, the **Department of Defense's (DOD)** Edwards Air Force Base in California will add 520 megawatts (MW) of CFE to the grid by completing one of the country's largest solar photovoltaic (PV) array projects and in the process creating more than 1,000 union and other construction jobs.

- In 2022, **DOD's** Pacific Missile Range Facility in Hawaii will complete construction of the nation's largest 100 percent clean energy microgrid. By leveraging a 14-megawatt (MW) solar facility paired with a 70 megawatt-hour (MWh) battery energy storage system sited on the base, the Pacific Missile Range Facility can become self-sufficient for all its electricity needs in the event of a loss of transmission feed from the utility grid.

### **100 Percent ZEV Acquisitions by 2035, including 100 percent Light-Duty ZEV Acquisitions by 2027**

- In 2021, the **Department of the Interior (DOI)** began transitioning its fleet of U.S. Park Police lightweight motorcycles and dirt bikes to 100 percent ZEVs at its Washington, D.C., New York City, and San Francisco locations, with plans to reach a 100 ZEV fleet by 2025.
- In early 2022, the **Department of Homeland Security (DHS)** will begin field testing the Ford Mustang Mach-E ZEV for use in its law enforcement fleet, which currently consists of over 30,000 vehicles.

### **Net-Zero Emissions Buildings by 2045, including a 50 percent reduction by 2032**

- In 2023, the **Department of Transportation will complete its** Volpe Transportation Center project that collapses six buildings into a low-emissions building with rooftop solar PV panels, ZEV charging stations for the federal fleet and employee vehicles, green and cool roof technologies, a rainwater reclamation and reuse system, and a climate-resilient above-grade data center.
- By 2022, the **Department of the Treasury** will have completed the majority of its energy infrastructure improvements at an Internal Revenue Service Center outside of New York City through a 17-year, \$30.9 million energy savings performance contract (ESPC). The ESPC has so far delivered nearly \$14 million in capital improvements and \$2.2 million in annual utility bill savings. ESPCs allow federal agencies to procure energy savings and facility improvements with no up-front capital costs or special appropriations from Congress.

### **Net-Zero Emissions Procurement by 2050**

- In 2021, **DOD** collected information from its suppliers on their efforts to measure and report greenhouse gas (GHG) emissions. DOD is using this information to develop low-carbon purchasing guidelines that will become part of its standard operating procedures.

- In 2022, the **General Services Administration (GSA)** will require contractors to disclose the embodied carbon of building materials for new building and major modernization contracts. Embodied carbon refers to the greenhouse gas emissions (mostly carbon dioxide) resulting from the mining, harvesting, processing, manufacturing, transportation, and installation of materials.

### **Net-Zero Emissions from overall Federal Operations by 2050, including a 65 percent reduction by 2030**

- By January 2022, **DOD's** Marine Corps Logistics Base Albany in Georgia anticipates achieving net-zero energy status.

### **Climate Resilient Infrastructure and Operations**

- In 2021, more than 20 major federal agencies released plans describing how they will integrate climate-readiness across missions and programs and bolster resilience of Federal assets. For example, the **Department of Housing and Urban Development (HUD)** is collecting building-level data across HUD programs to map existing climate risks to help inform the Department on how to best address climate impacts and protect HUD-assisted assets and their occupants.
- **DOD** is integrating climate change considerations across its strategic guidance and planning documents, including the National Defense Strategy, which will be released in 2022.

### **Develop a Climate- and Sustainability-Focused Workforce**

- The **Department of State** is assessing its climate and sustainability management staffing and training gaps to inform a longer-term plan that will prioritize areas of concern and greatest needs.
- In 2022, the **Department of Labor** will launch a new training course for its senior leadership team on climate change management considerations and environmental justice principals. The Department will also include climate change literacy in new employee orientation material.

### **Advance Environmental Justice and Equity**

- In 2021, **GSA** launched an Environmental Justice and Equity Task Group to identify and propose effective approaches to improve environmental justice and equity in federal

sustainable building processes, enhancing engagement with communities and key partners throughout the building lifecycle.

- In 2021, the **Department of Commerce's** National Oceanic and Atmospheric Administration (NOAA) convened Climate and Equity roundtables across the country to gather feedback to inform how NOAA provides climate services, engages with underserved and vulnerable communities, and strengthens internal processes to respond to expressed needs.
- As outlined in its October 2021 Strategic Framework for Addressing Climate Change, **DHS** is incorporating the need to achieve equity as guiding principle through all lines of effort described in the framework.

### **Accelerate Progress Through Domestic and International Partnerships**

- In 2021, the United States and Canada launched the Greening Government Initiative, a first-of-its-kind initiative that will enable countries to share lessons learned, promote innovation, and accelerate national efforts to green government operations and help meet Paris Agreement commitments. Today, the 39 GGI participating countries are beginning share key organizational features and policies and identify potential areas for collaboration.
- In 2020, the **Department of Veterans Affairs** (VA) New England's Boston Healthcare System partnered with National Grid on a plan to transition its 70-car fleet to ZEVs. Consistent with National Grid's recommendations, VA is working with GSA to procure approximately 25 ZEVs in the 2022 acquisition cycle.

Content

## Action

Updated Policy Statement on Certification of New Interstate Natural Gas Facilities.

## Summary

This Updated Policy Statement describes how the Commission will evaluate all factors bearing on the public interest in determining whether a new interstate natural gas transportation project is required by the public convenience and necessity under the Natural Gas Act.

## Dates

Comments that pertain to the Paperwork Reduction Act are due May 2, 2022.

## For Further Information Contact

Paige Espy (Legal Information), Office of the General Counsel, 888 First Street NE, Washington, DC 20426, (202) 502-6698, [Paige.Espy@ferc.gov](mailto:Paige.Espy@ferc.gov)

Brandon Cherry (Technical Information), Office of Energy Projects, Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC 20426, (202) 502-8328, [Brandon.Cherry@ferc.gov](mailto:Brandon.Cherry@ferc.gov)

## Supplementary Information

1. On April 19, 2018, and February 18, 2021, the Commission issued Notices of Inquiry (NOI) <sup>(1)</sup> to help the Commission explore whether, and if so how, it should revise the approach established by its currently effective policy statement on the certification of new interstate natural gas transportation facilities (1999 Policy Statement) <sup>(2)</sup> to determine whether a proposed natural gas project “is or will be required by the present or future public convenience and necessity,” as that standard is established in section 7 of the Natural Gas Act (NGA). <sup>(3)</sup>

2. Based on the comments received in this proceeding and the significant changes that have occurred since issuance of the 1999 Policy Statement, and in order to provide stakeholders with more clarity on the Commission's decision-making process, we are issuing this Updated Certificate Policy Statement (Updated Policy Statement).

3. This Updated Policy Statement does not establish binding rules and is intended to explain how the Commission will consider applications to construct new interstate natural gas transportation facilities.

### I. Background

#### A. Statutory Authority and Obligations

4. Section 7 of the NGA authorizes the Commission to issue certificates of public convenience and necessity for the construction and operation of facilities transporting natural gas in interstate commerce. <sup>(4)</sup> Under section 7(e), the Commission shall issue a certificate to any qualified applicant upon finding that the construction and operation of a proposed project “is or will be required by the present or future public convenience and necessity.” <sup>(5)</sup> The public convenience and necessity standard encompasses all factors bearing on the public interest. <sup>(6)</sup>

5. The NGA authorizes the Commission to attach to a certificate “such reasonable terms and conditions as the public convenience and necessity may require.” <sup>(7)</sup> The Commission can also deny an application for a certificate if a balancing of all public interest factors weighs against authorization of the proposed project. <sup>(8)</sup> If an applicant receives a certificate from the Commission, section 7(h) of the NGA authorizes the certificate holder to acquire the property rights necessary to construct and operate its project by use of eminent domain if it cannot reach an agreement with a landowner. <sup>(9)</sup>

6. The Commission's consideration of an application generally triggers environmental review under the National Environmental Policy Act of 1969 (NEPA). <sup>(10)</sup> NEPA and its implementing regulations require that, before taking or authorizing a major Federal action that may significantly affect the quality of the human environment, Federal agencies take a “hard look” at the environmental consequences of the proposed action and disclose their analyses to the public. <sup>(11)</sup> NEPA also requires that agencies consider whether there are steps that could be taken to mitigate any adverse environmental consequences. <sup>(12)</sup> While NEPA is a procedural statute and does not require an agency to reject a proposed project based on its adverse effects or to take action to mitigate those effects, <sup>(13)</sup> an agency may require mitigation measures as a condition of its approval under the NGA, <sup>(14)</sup> or withhold approval based on significant adverse effects. <sup>(15)</sup>

#### B. Historical Context and the 1999 Certificate Policy Statement

7. From the enactment of the NGA in 1938 to the 1990s, as a result of statutory and regulatory revisions, the natural gas industry evolved away from a system of limited competition among vertically integrated companies selling bundled commodity and transportation services at Commission-regulated prices to one where pipelines provide open-access transportation of gas supplies purchased pursuant to non-Commission regulated agreements between producers and other parties. Consequently, consumers benefitted from competition among non-pipeline entities in an unregulated commodity market and from competition among pipeline companies providing open-access, unbundled transportation services at Commission-regulated rates or, if authorized under certain circumstances, market-based rates.

8. At the same time that natural gas commodity and transportation markets were becoming more competitive, the 1990s saw significant growth in natural gas consumption in the industrial and electric generation sectors. The resultant expansion of the pipeline system to meet this demand raised issues as to who should bear the costs of new construction. Before the Commission adopted the 1999 Policy Statement, the Commission's pricing policy for new construction generally allowed for the costs of expansion projects to be rolled into a pipeline company's existing system costs to derive rolled-in rates in a future rate case under section 4 of the NGA. <sup>(16)</sup> All shippers bore some burden of the expansion project's cost, regardless of whether they would benefit from the project. Local distribution companies (LDC) and other parties believed that this pricing policy sent the wrong price signals by masking the real costs of an expansion project and could result in overbuilding and subsidization of expansion by a pipeline's existing shippers.

9. In response to these and other concerns, in 1998, the Commission issued a Notice of Proposed Rulemaking <sup>(17)</sup> and an NOI <sup>(18)</sup> to explore issues related to its policies on the certification and pricing of new pipeline projects. Based on the information received from stakeholders in response to these notices, the Commission issued the 1999 Policy Statement "to foster competitive markets, protect captive customers, and avoid unnecessary environmental and community impacts while serving increasing demands for natural gas." <sup>(19)</sup> These objectives were realized primarily by a shift from a presumption of rolled-in pricing to a presumption of incremental pricing. <sup>(20)</sup> Under incremental pricing, existing customers using only existing facilities do not subsidize the cost of constructing and operating new projects. <sup>(21)</sup>

10. Pursuant to the 1999 Policy Statement, when reviewing applications to construct new interstate transportation facilities the Commission would first determine whether a threshold requirement of no financial subsidization from existing customers was met. If so, the Commission would next consider whether the applicant eliminated or minimized any residual adverse effects the project might have on: (1) The applicant's existing customers; (2) existing pipelines in the market and their captive customers; and (3) landowners and communities affected by the proposed project. <sup>(22)</sup> Any residual adverse effects would be balanced against the anticipated benefits from the project. <sup>(23)</sup> The Commission allowed an applicant to rely on a variety of factors to demonstrate that its proposed project was needed, <sup>(24)</sup> but, in practice, applicants generally elected to submit, and the Commission accepted, precedent agreements with prospective customers for long-term firm service as the principal factor in demonstrating project need.

11. The 1999 Policy Statement introduced a sliding scale approach to balance public benefits with adverse effects, where the "more interests adversely affected or the more adverse impact a project would have on a particular interest, the greater the showing of public benefits from the project required to balance the adverse impact." <sup>(25)</sup> The 1999 Policy Statement provided that, if the Commission found that project benefits outweighed adverse impacts on economic interests, then the Commission would proceed to consider the environmental impacts of the project. <sup>(26)</sup>

### C. Developments After Issuance of the 1999 Certificate Policy Statement

12. Much has changed since the Commission issued the 1999 Policy Statement. In the last decade, increases in both domestic and international demand for natural gas produced in the United States, combined with the available supply of competitively-priced gas from shale reserves, have reduced prices

and price volatility and have resulted in more proposals for natural gas transportation and export projects. <sup>(27)</sup> Much of the increased production is attributable to the development of the Marcellus and Utica shale formations in Pennsylvania, West Virginia, Ohio, and New York; shale formations in the Permian Basin in West Texas and Eastern New Mexico; Eagle Ford Shale in South Texas; and Bakken Shale Formation in North Dakota, among others; as well as associated new extraction technologies.

13. Contracting patterns are changing significantly as a result of this supply growth. In the past, LDCs contracted for a large percentage of interstate pipeline capacity, obtaining supplies from the production area for their customers. Increasingly, however, LDCs are purchasing gas supplies further downstream at market area pooling points or at their city gates as other parties increasingly contract for pipeline capacity. Natural gas producers are now contracting for a significant amount of firm pipeline capacity on expansion projects in an effort to provide a secured commercial outlet for their gas.

14. Over the past decade, there has been greater interest and participation by affected landowners and communities, Tribes, environmental organizations, and others in natural gas project proceedings. Part of this may be attributable to the increase in proposals for new natural gas infrastructure in more densely populated areas of the eastern half of the nation. These stakeholders have raised various concerns with, among other things, the use of eminent domain, the need for new projects, and the environmental impacts of project construction and operation, including impacts on climate change and environmental justice communities.

15. The Commission's consideration of climate change and greenhouse gas emissions (GHG) has also evolved since issuance of the 1999 Policy Statement. In the last decade, the Commission began including estimates of GHG emissions from project construction ( *e.g.*, tailpipe emissions from construction equipment) and operation ( *e.g.*, fuel combustion at compressor stations and gas venting and leaks) in its NEPA documents. <sup>(28)</sup> Then, starting in late 2016, the Commission began to estimate GHG emissions from downstream combustion and upstream production. <sup>(29)</sup> In 2018, however, the Commission reversed this practice, <sup>(30)</sup> resulting in a number of judicial decisions finding fault with the Commission's approach. <sup>(31)</sup> Concurrent with this Updated Policy Statement, the Commission is issuing a new policy statement to explain how it will assess project impacts on climate change in its NEPA and NGA reviews going forward (GHG Policy Statement). <sup>(32)</sup>

16. Another development since issuance of the 1999 Policy Statement is an increasing recognition of the need for Federal agencies to focus on environmental justice and equity. In 1994, under Executive Order 12898, agencies were directed to identify and address “disproportionately high and adverse human health or environmental effects” of their actions on minority and low-income populations ( *i.e.*, environmental justice communities). <sup>(33)</sup> In 2021, President Biden issued two executive orders to renew and expand upon this directive. Specifically, Executive Order 13985, issued on January 20, 2021, requires agencies to conduct Equity Assessments to identify and remove barriers to underserved communities and “to increase coordination, communication, and engagement with community-based organizations and civil rights organizations.” <sup>(34)</sup> And Executive Order 14008, issued on January 27, 2021, directs agencies to develop “programs, policies, and activities to address the disproportionately high and adverse human health, environmental, climate-related and other cumulative impacts on disadvantaged communities, as well as the accompanying economic challenges of such impacts.” <sup>(35)</sup>

## II. Notices of Inquiry and Comments

17. As noted above, on April 19, 2018, the Commission issued an NOI (2018 NOI) seeking information and stakeholder perspectives to help the Commission explore whether, and if so how, it should revise the approach established by the 1999 Policy Statement. The Commission identified four general areas for examination in the 2018 NOI: (1) The reliance on precedent agreements to demonstrate need for a

proposed project; (2) the potential exercise of eminent domain and landowner interests; (3) the Commission's evaluation of alternatives and environmental effects under NEPA and the NGA; and (4) the efficiency and effectiveness of the Commission's certificate processes. In response to the 2018 NOI, the Commission received more than 3,000 comments from a diverse range of stakeholders.

18. On February 18, 2021, the Commission issued another NOI (2021 NOI) seeking to build upon the existing record established by the 2018 NOI. The 2021 NOI noted that a number of changes had occurred since the Commission issued the 2018 NOI, including regulatory changes, the issuance of new executive orders, and increased stakeholder interest in certain topics. Accordingly, the 2021 NOI provided stakeholders with an opportunity to refresh the record and provide updated information and additional viewpoints to help the Commission assess its policy.

19. The 2021 NOI included the four general areas of examination identified in the 2018 NOI, with modifications to the specific questions asked, including new questions on how the Commission should assess and consider the impacts of proposed projects on climate change. The 2021 NOI also identified a fifth area of examination—the Commission's identification and consideration of disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on environmental justice communities and the mitigation of those adverse impacts and burdens, as well as the Commission's identification of potentially affected environmental justice communities and measures for ensuring effective participation by these communities in the certificate review process. In response to the 2021 NOI, the Commission received more than 35,000 comments, including more than 150 unique comment letters, from a diverse range of stakeholders.

20. The comments received in response to the 2018 and 2021 NOIs are summarized at a high level below. Comments related to GHG emissions are summarized in the aforementioned GHG Policy Statement.<sup>(36)</sup> The considerable number of comments submitted in this proceeding indicates substantial public interest in the Commission's policy for reviewing proposed interstate natural gas facilities.

#### A. The Commission's Determination of Need

21. A wide range of commenters request that the Commission change how it makes its public need determination. Many of these commenters argue that the Commission should rely less on precedent agreements.<sup>(37)</sup> Additionally, commenters request that, in assessing need, there be greater consideration of climate change impacts,<sup>(38)</sup> increased transparency,<sup>(39)</sup> and an enlarged participatory role for stakeholders.<sup>(40)</sup> Some commenters recommend that applicants be required to provide specific evidence that need exists, the proposed facilities serve that need, and the asserted need cannot be met by existing infrastructure.<sup>(41)</sup> In contrast, regulated companies and industry trade organizations are nearly unanimous in their general support of the 1999 Policy Statement as it relates to the public need determination.<sup>(42)</sup>

22. Several commenters argue that the public benefits recognized in the 1999 Policy Statement are skewed, overly narrow, and outdated.<sup>(43)</sup> Additionally, some commenters recommend that the Commission create clear guidelines for benefits like reliability and resilience.<sup>(44)</sup> Some commenters suggest that the Commission consider additional factors in its benefits analysis, such as infrastructure security and how an applicant's proposal fits with, or advances, new Federal and State policies and goals.<sup>(45)</sup> In contrast, industry trade organizations generally support the Commission's existing benefits analysis under the 1999 Policy Statement, arguing that the Commission's responsibilities under the NGA have not changed, and, thus, any changes to the Commission's review of public benefits should not impede those responsibilities.<sup>(46)</sup> However, some regulated companies recommend that the Commission more heavily weigh certain benefits, such as reliability and resilience, in light of recent extreme cold weather events and ransomware attacks.<sup>(47)</sup>

23. Regarding what evidence the Commission should examine to determine project need, many non-governmental organizations (NGO), individual commenters, and other entities argue that the Commission should analyze factors beyond precedent agreements, such as future markets, opportunity costs, Federal and State public policies, and effects on competition. <sup>(48)</sup> NGOs request that the Commission take a more “holistic” approach and assess proposed projects in conjunction with other projects that are designed to serve the same market, serve similar markets, or pass through the same region, <sup>(49)</sup> and that there be increased coordination with State agencies, including allowing State regulators to review and approve precedent agreements prior to the Commission making a need determination. <sup>(50)</sup> In contrast, regulated companies and industry trade organizations State that precedent agreements remain powerful indicators of need, as they represent long-term, binding contractual and financial commitments to a project and are more objective evidence than market studies. <sup>(51)</sup>

24. Several commenters recommend that when applicants provide precedent agreements with affiliates as evidence of need, the Commission look beyond those agreements, given that companies with common profit interests might have incentives to inflate costs which can then be passed on to captive ratepayers. <sup>(52)</sup> Additionally, several commenters argue that the terms of precedent agreements should be subject to close scrutiny <sup>(53)</sup> and that the Commission should consider the potential for an asset to be rendered obsolete before the end of its useful life, as well as the length of time over which an asset's costs are recovered. <sup>(54)</sup> In contrast, regulated companies and industry trade organizations argue that the Commission should not distinguish between affiliate and non-affiliate agreements, as standards of conduct and nondiscrimination require pipeline companies to treat all customers equitably, regardless of whether the customer is an affiliate or a non-affiliate. <sup>(55)</sup> These entities allege that economic risk, financial obligation, and oversight by State and local regulators associated with precedent agreements demonstrate that they are clear evidence of need, regardless of whether the shipper is an affiliate. <sup>(56)</sup>

25. A wide range of commenters assert that the Commission must consider the end use of the natural gas to be transported in its assessment of need, even if end use could change over time. <sup>(57)</sup> Some commenters also note that climate change issues cannot be appropriately addressed without a firm understanding of end use. <sup>(58)</sup> However, regulated companies and industry trade organizations argue against consideration of expected end use given the practical challenges of dynamic gas markets, <sup>(59)</sup> the Commission's regulations prohibiting pipelines from unduly discriminating among shippers based on end use, <sup>(60)</sup> and the fact that regulating end use is outside the scope of the Commission's statutory authority. <sup>(61)</sup>

26. Many commenters recommend that the Commission assess need in a regional planning context, including consideration of existing infrastructure, in order to avoid unnecessary environmental harm, “underutilized or stranded” assets, and needlessly higher rates for captive consumers. <sup>(62)</sup> Regulated companies and industry trade organizations, however, generally oppose the Commission using a regional approach to review natural gas pipeline projects, asserting that this could needlessly delay construction, <sup>(63)</sup> the proximity of pipeline projects does not necessarily indicate that projects serve the same need in a region, <sup>(64)</sup> and the open season process already serves to ensure duplicative projects are not constructed. <sup>(65)</sup> Also, these entities do not support the Commission further examining whether existing infrastructure could sufficiently meet demand. <sup>(66)</sup>

27. Additionally, several commenters assert that the Commission must consider future demand as facilities age, as well as national and State decarbonization policies and targets. <sup>(67)</sup> In contrast, regulated companies and industry trade organizations contend that assessment of future demand is not necessary or prudent, given that sophisticated market participants already make these calculations, and do not support the Commission performing a comparative or future-looking analysis of energy sources. <sup>(68)</sup> These entities emphasize that demand for natural gas projects will be correlated with demand for, and deployment of, variable energy resources. <sup>(69)</sup>

28. Generally, commenters are split on whether, and if so how, the Commission should consider the economic, energy security, and social attributes of domestic production and use of natural gas in reviewing proposed projects. Some regulated companies State that consideration of these factors should be limited; <sup>(70)</sup> however, others argue that the Commission should consider attributes such as job creation and tax revenues. <sup>(71)</sup> Several individuals and NGOs State that the Commission could consider these attributes for particular projects, but that the Commission should then also consider the costs of natural gas projects associated with increased noise, lowered property values, lowered air quality, a lowered tax base, and the loss of landowners' potential use of their land. <sup>(72)</sup> Commenters also recommend that any need analysis be focused on the specific benefits of a proposed project rather than hypothetical or general benefits <sup>(73)</sup> and that the Commission assess the magnitude or extent of both the benefits and burdens of a proposed project, including whether the jobs created are temporary or permanent, as well as the proportion of the jobs that will be filled by low- to middle-income local workers. <sup>(74)</sup>

#### B. The Exercise of Eminent Domain and Landowner Interests

29. Many commenters suggest that the Commission adjust its approach to considering the possible use of eminent domain. For example, some commenters assert that eminent domain should only be an option for projects that can guarantee domestic use or local benefit, or that the Commission should deny certificates that would rely on eminent domain for more than twenty percent of the proposed route. <sup>(75)</sup> In contrast, regulated companies and industry trade organizations State that the Commission should maintain its current approach, as it adequately protects landowners from the unnecessary use of eminent domain by ensuring that only projects that are needed and that do not require subsidization from existing customers are approved. <sup>(76)</sup> These entities also note that it is not possible for the Commission to reliably estimate the amount of eminent domain that will ultimately be used prior to issuance of a certificate. <sup>(77)</sup>

30. Some commenters assert that additional measures should be taken to minimize the use of eminent domain for projects, including routing pipelines in existing utility corridors when possible, requiring proof that an applicant's efforts to negotiate with landowners have failed, or reporting to the Commission each easement as it is agreed upon. <sup>(78)</sup> However, many regulated companies state that additional measures to minimize the use of eminent domain are unnecessary, as companies have already taken steps to ensure it is used infrequently. <sup>(79)</sup>

31. Several commenters recommend that the Commission give greater weight to the concerns of impacted landowners and communities. <sup>(80)</sup> Some assert that landowners have unequal bargaining power with applicants and that the Commission should consider whether an applicant's pre-certificate actions related to landowners demonstrate that the applicant acted in good faith. <sup>(81)</sup> Additionally, some commenters argue that the Commission should expand the regulatory definition of "affected landowners" to ensure all impacted landowners and residents are included in the Commission's consideration. <sup>(82)</sup>

32. Multiple commenters state that it is the Commission's responsibility to explain the certificate process to landowners and to ensure that they have the necessary tools to fully participate. <sup>(83)</sup> Regulated companies and industry trade organizations support the creation of the Commission's Office of Public Participation (OPP) to guide landowners' understanding of, and participation in, the pipeline development and review process. <sup>(84)</sup> Several commenters recommend that the Commission designate certain staff as non-decisional to act as official procedural case managers. <sup>(85)</sup>

33. Numerous commenters also recommend changes to the Commission's process and resources to assist landowners, including incorporating non-traditional outreach methods to notify and engage stakeholders early and throughout the process, improving the Commission's website and eLibrary system, conducting public meetings and site visits focused on landowner issues, and providing longer public comment periods. <sup>(86)</sup> Some commenters propose that the Commission automatically grant all affected landowners party status to project proceedings, or, at a minimum, provide an updated step-by-step guide for landowners on

how to intervene. <sup>(87)</sup> Industry trade organizations support longer intervention periods for landowners, <sup>(88)</sup> while some regulated companies argue that the Commission should limit interventions to entities that have a direct interest in a specific project. <sup>(89)</sup>

34. A wide range of commenters argue that, in order to prevent needless condemnations while routes are still subject to change and it is uncertain if a project will be authorized, the Commission could defer issuing a certificate or condition a certificate holder's exercise of eminent domain until an applicant obtains all final Federal and State permits and issuance of such permits is sustained if appeal is filed. <sup>(90)</sup> In contrast, many regulated companies and industry trade organizations assert that the Commission has no authority under the NGA to condition a certificate holder's exercise of eminent domain because eminent domain is a right that arises directly from the NGA. <sup>(91)</sup> These commenters express concern that if the Commission defers issuing a certificate until an applicant has all authorizations needed to commence construction, it would create practical challenges and could result in unintended consequences ( e.g., a pipeline may need survey access in order to obtain information necessary for another permit). <sup>(92)</sup>

### C. The Commission's Consideration of Environmental Impacts

35. Many commenters suggest that the Commission revise its approach to analyzing alternatives under NEPA. Some commenters recommend that the Commission consider a broader scope of alternatives ( e.g., modifications to existing infrastructure, co-location with existing infrastructure, and alternative sources of energy generation) <sup>(93)</sup> or a broader range of factors to compare alternatives ( e.g., the quantified and monetized impact of GHG emissions; impact of natural gas exports on domestic energy prices; and cost-effectiveness when accounting for all significant health, productivity, and opportunity costs). <sup>(94)</sup> Additionally, commenters assert that the Commission should not blindly adopt a project sponsor's project purpose and, consistent with *Citizens Against Burlington, Inc. v. Busey*, <sup>(95)</sup> must evaluate alternatives to achieve the Commission's goals, shaped by the application before it and the Commission's function in the decisional process. <sup>(96)</sup> In contrast, regulated companies and industry trade organizations state that the current scope of the Commission's alternatives analysis is appropriate and consistent with NEPA, and has been upheld by the courts. <sup>(97)</sup> These entities also assert that *Busey* prohibits the Commission from considering alternatives that would not meet the purpose and need of the proposed Federal action. <sup>(98)</sup>

36. Many commenters request that the Commission change how it conducts its cumulative effects analysis under NEPA. For example, NGOs and other commenters recommend that the Commission conduct regional evaluations <sup>(99)</sup> and prepare programmatic environmental impact statement (EIS) <sup>(100)</sup> to address cumulative effects. To determine the geographic scope for regional evaluations, commenters recommend that the Commission use a radius around the proposed project ( e.g., 100 miles) <sup>(101)</sup> or consider the project scale, gas source, and end-use location. <sup>(102)</sup> In contrast, industry trade organizations and regulated companies recommend that the Commission continue to use a project-specific geographic scope for its cumulative effects analysis. <sup>(103)</sup> These entities assert that the Commission does not have the authority under section 7 of the NGA to conduct regional evaluations, as the Commission only reviews individual pipeline applications, not broader Federal programs or regional actions where a programmatic review might be appropriate. <sup>(104)</sup>

37. NGOs and individual commenters state that how the Commission balances environmental impacts against favorable economic impacts is unclear, lacks transparency, and requires updating. <sup>(105)</sup> Several commenters request that the Commission give environmental impacts greater weight. <sup>(106)</sup> Other commenters criticize the Commission's phased approach to addressing project impacts under the 1999 Policy Statement, and recommend that the Commission balance economic and environmental impacts together. <sup>(107)</sup> In contrast, industry trade organizations state that the Commission's approach under the 1999 Policy Statement properly balances economic and environmental impacts, giving proportionate

consideration to all impacted stakeholders. <sup>(108)</sup> These entities contend that broadening the balancing would exceed the Commission's discretion under the NGA <sup>(109)</sup> and that the NEPA requirement to take a “hard look” at environmental consequences should remain separate from consideration of economic impacts. <sup>(110)</sup>

38. Regulated companies and industry trade organizations support the adoption of other agencies' categorical exclusions under NEPA, including those referenced in Commission staff's presentation at the January 19, 2021 Commission meeting (Docket No. RM21-10-000). <sup>(111)</sup> Additionally, these entities state that a categorical exclusion should apply to certain actions that do not currently qualify for the Commission's blanket certificate authority ( e.g., project amendments that would result in no, or minimal, changes to the environment). <sup>(112)</sup> In contrast, NGOs suggest that there is no need for the Commission to expand its existing categorical exclusions, and they request that the Commission provide a public notice and comment period for all projects in which an applicant proposes to use a categorical exclusion. <sup>(113)</sup>

#### D. The Efficiency and Effectiveness of the Commission's Review Process

39. Many commenters recommend changes to the Commission's application review process. For example, some commenters recommend that all affected stakeholders be brought into the process as early as possible, <sup>(114)</sup> that decisions regarding information requirements be summarized in a comprehensive application completeness checklist, and that the Commission's regulations be amended to encourage applicants to submit complete applications at the outset. <sup>(115)</sup> Additionally, several commenters recommend changes to the Commission's environmental review process, including that the Commission not prepare a NEPA document absent substantive environmental data for the entirety of the proposed route, <sup>(116)</sup> that the Commission consider issuing final EISs and certificates at the same time, <sup>(117)</sup> or, alternatively, that the Commission issue certificates within 90 days of issuance of a final NEPA document. <sup>(118)</sup> Some commenters also state that the Commission should not inject additional regulatory uncertainty into its review process by requiring open-ended or unduly expansive environmental reviews. <sup>(119)</sup>

40. Commenters also make a variety of recommendations to increase transparency in the Commission's review process and schedules. For example, some commenters propose that the Commission issue a public notice when a draft order has been circulated by Commission staff to the Commissioners, <sup>(120)</sup> establish “permitting timetables” for NGA section 7(c) projects, <sup>(121)</sup> and clarify deadlines for parties to intervene or submit studies. <sup>(122)</sup> Some commenters also recommend that there be a “cooling off” period after the issuance of a draft EIS to resolve disputes between an applicant and stakeholders with assistance from the Commission's Dispute Resolution Service. <sup>(123)</sup>

41. Several commenters recommend changes to the duration of the pre-filing process. Recommendations include shortening the pre-filing process and extending the application review process, <sup>(124)</sup> collapsing pre-filing into the post-filing process to eliminate lengthy processing times, <sup>(125)</sup> and condensing the application review process by consolidating as much activity as possible in the pre-filing process and requiring all interested parties planning to object to a project to do so during pre-filing. <sup>(126)</sup>

42. Many commenters also propose ways to make stakeholder participation more effective. For example, some commenters propose that applicants provide transportation or access to public transportation to public meetings, adequate parking at venues, and options for remote participation. <sup>(127)</sup> Several commenters also recommend that the Commission provide notices and related materials in multiple languages <sup>(128)</sup> and issue guidance to ensure that pipeline project developers provide sufficient and timely information. <sup>(129)</sup> Additionally, some commenters recommend that the Commission's new OPP be a neutral resource to landowners and other stakeholders seeking more information on the Commission's review process. <sup>(130)</sup> Other commenters recommend that staff prioritize input provided by stakeholders that will be directly impacted by a project, <sup>(131)</sup> and that all comments submitted to a docket receive a response or some other indication that a member of Commission staff has read the comments. <sup>(132)</sup>

43. Several commenters note the importance of transparency and coordination in the interagency review process. Some regulated companies recommend that the Commission strengthen its role as the lead agency under NEPA by focusing on educating and training cooperating agencies to be better prepared to meet their own statutory deadlines.<sup>(133)</sup> Other commenters suggest that the Commission consider standardized schedules for its review processes, such as publishing timelines that include pre-filing, preparation of the NEPA document, and issuance of final orders and authorizations by other agencies,<sup>(134)</sup> and that the Commission create a dedicated task force for coordinating with other agencies.<sup>(135)</sup>

44. Many commenters support the separate treatment of different classes of projects, recommending that the Commission provide more timely review of projects with minimal impacts and certain qualifying benefits,<sup>(136)</sup> or expedite approvals for projects where only an environmental assessment is required and there is no opposition.<sup>(137)</sup> However, other commenters oppose the separate treatment of different classes of projects, expressing concern that separate treatment would be arbitrary or discriminatory<sup>(138)</sup> and that some projects would be left in limbo while the Commission takes action on what it perceives as priority projects.<sup>(139)</sup> Some commenters also suggest changes to the Commission's blanket certificate program, including changing the filing requirements to reduce the number of required resource reports, eliminating the need for weekly reports,<sup>(140)</sup> increasing both the automatic and prior notice cost limits,<sup>(141)</sup> and adding consideration of other factors such as a project's acreage to determine eligibility for blanket certificate authority.<sup>(142)</sup>

#### E. The Commission's Consideration of Effects on Environmental Justice Communities

45. Many commenters suggest that the Commission revise its approach for identifying environmental justice communities in certificate proceedings. For example, some commenters recommend that the Commission use census block-level data;<sup>(143)</sup> on-the-ground surveys;<sup>(144)</sup> social, environmental, and health indicators;<sup>(145)</sup> and other data and tools to identify such communities.<sup>(146)</sup> Additionally, several commenters recommend that the Commission consult with other Federal and State agencies for assistance with identifying environmental justice communities<sup>(147)</sup> or allow communities to identify themselves as environmental justice communities.<sup>(148)</sup>

46. Many commenters also recommend changes to how the Commission evaluates project impacts on environmental justice communities. For example, NGOs assert that the Commission should always use a reference or comparison group when evaluating disproportionately high and adverse impacts on such communities<sup>(149)</sup> and ensure that such a group is neither too geographically narrow nor too demographically similar to avoid masking disproportionate impacts.<sup>(150)</sup> NGOs and individual commenters recommend that the Commission consider the existing burden from specific environmental and health indicators when it evaluates cumulative and historic exposures, including the presence of other infrastructure and existing pollution levels in the project area.<sup>(151)</sup> Additionally, these commenters recommend changes to how the Commission evaluates the impacts of direct and indirect air pollution on environmental justice communities.<sup>(152)</sup> In contrast, regulated companies and industry trade organizations state that the Commission should not make substantive changes to how it evaluates impacts on environmental justice communities at this time, and recommend that the Commission wait for further guidance from the White House, EPA, and the Council on Environmental Quality (CEQ) to ensure consistency across the Federal Government.<sup>(153)</sup>

47. Many commenters state that there are barriers to the participation of environmental justice communities in Commission proceedings, including inadequate translation services and the Commission's reliance on electronic media.<sup>(154)</sup> Other commenters state that Commission proceedings can be highly technical in nature, rendering them inaccessible to the general public unless a participant can invest significant time and resources.<sup>(155)</sup> A wide range of commenters recommend changes to the Commission's public notice and outreach processes to ensure meaningful engagement with environmental justice communities,<sup>(156)</sup> including the Commission's process for consulting with Tribes.<sup>(157)</sup> Many commenters also support the

Commission's formation of OPP <sup>(158)</sup> and recommend that the Commission coordinate with community-based organizations and institutions to further encourage the participation of environmental justice communities in Commission proceedings. <sup>(159)</sup>

48. Several commenters assert that section 7(e) of the NGA provides the Commission with broad conditioning authority to address project impacts on environmental justice communities in its certificates. <sup>(160)</sup> Some commenters state that the Commission should use its NEPA alternatives analysis to identify and evaluate ways to mitigate impacts on environmental justice communities. <sup>(161)</sup> If mitigating adverse impacts on environmental justice communities is not possible, other commenters assert that the Commission should deny a certificate. <sup>(162)</sup>

49. In contrast, many regulated companies and industry trade organizations state that no Federal statute requires the Commission to implement specific remedial measures to address project impacts on environmental justice communities, but they assert that NEPA provides an appropriate framework in which to analyze such impacts. <sup>(163)</sup> These entities also contend that that the Commission's conditioning authority under section 7(e) of the NGA is limited to direct project impacts and the Commission could not require measures to redress prior industrial impacts on environmental justice communities or impacts outside of the Commission's jurisdiction. <sup>(164)</sup>

### III. Goals and Objectives of the Updated Certificate Policy Statement

50. While significant changes have occurred in the past 23 years, the Commission's goals and objectives with this Updated Policy Statement remain consistent with those of the 1999 Policy Statement, including to: (1) "appropriately consider the enhancement of competitive transportation alternatives, the possibility of over building, the avoidance of unnecessary disruption of the environment, and the unneeded exercise of eminent domain;" <sup>(165)</sup> (2) "provide appropriate incentives for the optimal level of construction and efficient customer choices;" <sup>(166)</sup> and (3) "provide an incentive for applicants to structure their projects to avoid, or minimize, the potential adverse impacts that could result from construction of the project." <sup>(167)</sup>

51. As discussed above, the 1999 Policy Statement included an analytical framework for how the Commission would evaluate the effects of certificating new projects on economic interests. With this Updated Policy Statement, the Commission intends to provide a more comprehensive analytical framework for its decision-making process. Specifically, we provide clarity on how the Commission will evaluate all factors bearing on the public interest, including the balancing of economic and environmental interests in determining whether a project is required by the public convenience and necessity, thus providing more regulatory certainty in the Commission's review process and public interest determinations.

### IV. Updated Certificate Policy Statement

#### A. Factors To Be Balanced in Assessing the Public Convenience and Necessity

52. In determining whether to issue a certificate of public convenience and necessity, the Commission will weigh the public benefits of a proposal, the most important of which is the need that will be served by the project, against its adverse impacts.

##### 1. Consideration of Project Need

53. To demonstrate that a project is required by the public convenience and necessity, an applicant must first establish that the proposed project is needed. As indicated above, the Commission's expectations and requirements for how applicants should demonstrate project need have evolved over time. In the 1999 Policy Statement, the Commission noted concerns associated with relying "primar[i]ly" <sup>(168)</sup> or "almost exclusively" <sup>(169)</sup> on contracts to establish need for a new project. Those concerns included the "additional

issues [that arise] when the contracts are held by pipeline affiliates”<sup>(170)</sup> and the difficulty such a policy creates for “articulat[ing] to landowners and community interests why their land must be used for a new pipeline project.”<sup>(171)</sup> Thus, the 1999 Policy Statement provided that:

[r]ather than relying only on one test for need, the Commission will consider *all relevant factors* reflecting on the need for the project. These might include, but would not be limited to, precedent agreements, demand projections, potential cost savings to consumers, or a comparison of projected demand with the amount of capacity currently serving the market.<sup>(172)</sup>

54. However, in practice, the Commission has relied almost exclusively on precedent agreements to establish project need. Although courts have upheld the Commission's practice in certain contexts,<sup>(173)</sup> we find that we cannot adequately assess project need without also looking at evidence beyond precedent agreements. After all, as the Commission's 1999 Policy Statement noted, many different factors may indicate the need—or lack thereof—for a new interstate pipeline. While precedent agreements may indicate one or more shipper's willingness to contract for new capacity, such willingness may not in all circumstances be sufficient to sustain a finding of need— *e.g.*, in the face of contrary evidence or where there is reason to discount the probative value of those precedent agreements. Accordingly, we find that looking only to precedent agreements, and ignoring other, potentially contrary, evidence may cause the Commission to reach a determination on need that is inconsistent with the weight of the evidence in any particular proceeding, in violation of both the NGA and the Commission's responsibilities under the Administrative Procedure Act.<sup>(174)</sup> We reaffirm the Commission's commitment to consider *all* relevant factors bearing on the need for a project. Although precedent agreements remain important evidence of need, and we expect that applicants will continue to provide precedent agreements, the existence of precedent agreements may not be sufficient in and of themselves to establish need for the project. The Commission will also consider, as relevant, the circumstances surrounding the precedent agreements ( *e.g.*, whether the agreements were entered into before or after an open season and the results of the open season, including the number of bidders, whether the agreements were entered into in response to LDC or generator requests for proposals (RFP) and, if so, the details around that RFP process, including the length of time from RFP to execution of the agreement), as well as other evidence of need, as discussed below.

55. For all categories of proposed projects, we encourage applicants to provide specific information detailing how the gas to be transported by the proposed project will ultimately be used, why the project is needed to serve that use, and the expected utilization rate of the proposed project. To the extent applicants do not have information on the end use of the gas, they are encouraged to work with their prospective shippers to obtain it. The absence of this information may prevent an applicant from meeting its burden to demonstrate that a project is needed.

56. For a market-driven project that is responding to increased natural gas demand, the evidence relating to the need for the project could include a market study that projects volumetric or peak day load growth. An applicant may rely on publicly available analyses by the Energy Information Administration or other third parties showing projections of market growth. The applicant could also provide its best assessment, based on publicly available information or data, of whether other transportation suppliers may be able to meet the incremental demand with existing capacity to demonstrate why new pipeline construction is necessary. For individual shippers, load growth profiles, gas supply portfolios, and any advanced approval of contracts by State public service commissions would also be helpful in showing evidence of project need.

57. Some projects may not directly serve a customer but rather are being undertaken to add supplies of natural gas to the market. Such projects may be driven by natural gas producers or natural gas utilities attempting to provide supply at lower cost or support reliability by increasing the volumes of natural gas available to customers. For these projects, evidence to demonstrate consumer benefits may include projections of the net benefits, for example projected lower natural gas prices for consumers due to

increased supply competition, compared to the incremental costs of transportation on the new pipeline. The Commission will consider record evidence of regional projections for both gas supply and market growth, as well as pipeline-specific studies in these areas.

58. Other pipeline projects may be intended to support more efficient system operations by replacing older and inefficient facilities ( e.g., compressors and leak-prone pipes) and performing other infrastructure improvements, or to respond to changing State and Federal Government pipeline safety or environmental requirements. For these projects, applicants may document how proposed facilities, for example pipeline or compressor replacements, provide expected system benefits, such as reduced operating costs, improved pipeline integrity, or reduced natural gas leaks. In addition, an applicant may document how a project avoids adverse impacts or satisfies any changing State or Federal Government regulations.

59. The Commission will consider both current and projected future demand for a project based on the evidence in the record. Applicants are encouraged to submit analyses showing how market trends as well as current and expected policy and regulatory developments would affect future need for the project. Applicants are also encouraged to provide a thorough assessment of alternatives, including supporting data, to facilitate the Commission's review. In assessing the strength of the applicant's need showing, the Commission will consider record evidence of alternatives to the proposed project. The Commission's evaluation will include information indicating that other suppliers would be able to meet some or all of the needs to be served by the proposed project on a timely, competitive basis or whether other factors may eliminate or curtail such needs.

60. As the Commission noted in the 1999 Policy Statement, projects supported by precedent agreements with affiliates raise unique concerns regarding need for the project. <sup>(175)</sup> And, as the United States Court of Appeals for the District of Columbia Circuit (D.C. Circuit) recently held in *Environmental Defense Fund v. FERC*, "evidence of 'market need' is too easy to manipulate when there is a corporate affiliation between the proponent of a new pipeline and a single shipper who have entered into a precedent agreement." <sup>(176)</sup> Given those concerns, affiliate precedent agreements will generally be insufficient to demonstrate need. Instead, where projects are backed primarily by precedent agreements with affiliates, the Commission will consider additional information, such as the evidence outlined above. <sup>(177)</sup> We will determine how much additional evidence is required on a case-by-case determination.

61. To the extent the Commission receives information in the record from third parties addressing the need for a project, that too will be considered in our analysis. Where an applicant fails to carry its burden of demonstrating the proposed project is needed, the Commission will not undertake any further consideration of the project's benefits or adverse effects.

## 2. Consideration of Adverse Effects

62. In determining whether to issue a certificate of public convenience and necessity, the Commission will consider four major interests that may be adversely affected by the construction and operation of new projects: (1) The interests of the applicant's existing customers; (2) the interests of existing pipelines and their captive customers; (3) environmental interests; and (4) the interests of landowners and surrounding communities, including environmental justice communities. The Commission may deny an application based on any of these types of adverse impacts.

### a. Impacts on Existing Customers of the Pipeline Applicant

63. Existing customers of the pipeline applicant may be adversely affected if a proposed project causes an increase in rates or a degradation in service. Regarding potential rate increases, although we are no longer characterizing this issue as a "threshold question" in this Updated Policy Statement, our policy of no financial subsidies remains unchanged. <sup>(178)</sup> That is, the pipeline applicant must be prepared to financially

support its proposed project without relying on subsidization by its existing customers. As to other potential impacts to existing customers, like a degradation in service, we will consider the applicant's efforts to eliminate or minimize any such impacts.

64. As the Commission stated in the 1999 Policy Statement, the policy of no financial subsidies does not mean that a project sponsor has to bear all the financial risk of the project; the risk can be shared with new customers, but it generally cannot be shifted to existing customers. <sup>(179)</sup> One of the Commission's regulatory goals is to protect captive customers from rate increases during the terms of their contracts that are unrelated to the costs associated with their service. And existing customers of the expanding pipeline should not have to subsidize a project that does not serve them.

65. The 1999 Policy Statement also stated that the requirement that a new project must be financially viable without subsidies does not eliminate the possibility that, in some instances, project costs should be rolled into the rates of existing customers. <sup>(180)</sup> In most instances, incremental pricing will avoid subsidies for the new project, but the situation may be different in cases of inexpensive expansibility that is made possible because of earlier, costly construction. <sup>(181)</sup> In that instance, because the existing customers bear the cost of the earlier, more costly construction in their rates, incremental pricing could result in the new customers receiving a subsidy from the existing customers because the new customers would not face the full cost of the construction that makes their new service possible.

66. Additionally, expansion costs could still be included in existing shippers' rates when proposed projects are designed to improve service for existing customers. <sup>(182)</sup> Increasing the rates of existing customers to pay for projects designed to benefit those customers ( *i.e.*, by replacing existing capacity, improving reliability, or providing flexibility) is not a subsidy. <sup>(183)</sup>

#### b. Impacts on Existing Pipelines and Their Customers

67. As the Commission stated in the 1999 Policy Statement, existing pipelines that already serve the market to be served by the proposed new capacity may be affected by the potential loss of market share and the possibility that they may be left with unsubscribed capacity investment. <sup>(184)</sup> Additionally, captive customers of existing pipelines may be affected if they must pay for the resulting unsubscribed capacity in their rates. These remain important concerns.

68. It has been the Commission's long-standing position that it has an obligation to ensure fair competition, but that it is not the role of the Commission to protect existing pipelines from the effects of competition. <sup>(185)</sup> While we continue to maintain this position, we also emphasize that it is not just unfair competition that can harm captive customers. The Commission must consider the possible harm to captive customers that can result from a new pipeline, regardless of whether there is evidence of unfair competition.

69. Congress enacted the NGA "with the principal aim of encouraging the orderly development of plentiful supplies of . . . natural gas at reasonable prices, and protecting consumers against exploitation at the hands of natural gas companies." <sup>(186)</sup> Ensuring the orderly development of natural gas supplies includes preventing overbuilding. One way that the Commission can prevent overbuilding is through careful consideration of a proposed project's impacts on existing pipelines. To the extent that a proposed project is designed to substantially serve demand already being met on existing pipelines, that could be an indication of potential overbuilding. Nevertheless, in such instances, the Commission will also consider whether the proposed project would offer certain advantages ( *e.g.*, providing lower costs to consumers or enhancing system reliability).

70. Comments from existing pipelines and their captive customers about the potential impacts from a proposed project will be an important piece of our review. Additionally, comments from State utility or public service commissions as to how a proposed project may impact existing pipelines will be particularly useful.

### c. Environmental Impacts

71. As noted above, the 1999 Policy Statement included an analytical framework for how the Commission would evaluate the effects of certificating new projects on economic interests. However, the 1999 Policy Statement did not describe how the Commission would consider environmental interests in its decision-making process and, more specifically, how it would balance these interests with the economic interests of a project. Instead, it stated that environmental interests would be “separately considered” in a certificate proceeding after the balancing of public benefits against the residual adverse effects on economic interests. (187)

72. While the 1999 Policy Statement focused on economic impacts, the consideration of environmental impacts is an important part of the Commission's responsibility under the NGA to evaluate all factors bearing on the public interest. (188) In the years immediately following issuance of the 1999 Policy Statement, the Commission would sometimes issue a preliminary determination on the non-environmental issues associated with a proposed project, and then issue a subsequent decision on the certificate application following the environmental review process; however, in practice, Commission staff would begin review of both the economic and environmental impacts following the filing of an application. Today, the Commission no longer issues preliminary determinations on non-environmental issues, and the Commission and staff continue to review the economic and environmental impacts of projects concurrently. Thus, the sequential framing of these analyses in the 1999 Policy Statement has created some confusion and incorrectly conveyed how the Commission considers environmental impacts. In addition to questions about sequencing, we have seen a significant increase in comments from a range of stakeholders expressing concerns about how the Commission considers environmental impacts, including impacts on climate change and environmental justice communities, in its public interest determinations.

73. To provide more clarity and regulatory certainty to all participants in certificate proceedings, we explain here how the Commission will consider environmental impacts. (189) The Commission will balance all impacts, including economic and environmental impacts, together in its public interest determinations under the NGA. As discussed further below, the potential adverse impacts will be weighed against the evidence of need and other potential benefits of a proposal in determining whether to issue a certificate of public convenience and necessity.

74. We will consider environmental impacts and potential mitigation in both our environmental reviews under NEPA and our public interest determinations under the NGA. The Commission expects applicants to structure their projects to avoid, or minimize, potential adverse environmental impacts. Additionally, we expect applicants to propose measures for mitigating impacts, and we will consider those measures—or the lack thereof—in balancing adverse impacts against the potential benefits of a proposal. Further, the NGA grants the Commission broad authority to attach reasonable terms and conditions to certificates of public convenience and necessity. (190) Should we deem an applicant's proposed mitigation of impacts inadequate to enable us to reach a public interest determination, we may condition the certificate to require additional mitigation. We may also deny an application based on any of the types of adverse impacts described herein, including environmental impacts, if the adverse impacts as a whole outweigh the benefits of the project and cannot be mitigated or minimized.

75. As noted above, since issuance of the 1999 Policy Statement, the Commission's policy for considering climate impacts has evolved. (191) In addition to the significant increase in comments from stakeholders, the courts have issued several decisions addressing the Commission's evaluation of GHG emissions in certificate proceedings. The D.C. Circuit recently held that reasonably foreseeable downstream GHG emissions are an indirect effect of the Commission authorizing proposed projects (192) and are relevant to the Commission's determination of whether proposed projects are required by the public convenience and necessity. (193)

76. Concurrently with this Updated Policy Statement, we are issuing a separate policy statement to explain how the Commission will assess project impacts on climate change in certificate proceedings going forward. <sup>(194)</sup> This separate policy statement describes Commission procedures for evaluating climate impacts under NEPA and explains how the Commission will integrate climate considerations into its public convenience and necessity findings under the NGA, including how the Commission will consider measures to mitigate climate impacts. When making public interest determinations, we intend to fully consider climate impacts, in addition to other environmental impacts.

#### d. Impacts on Landowners and Surrounding Communities

77. The construction and operation of new natural gas infrastructure has the potential to result in adverse impacts on the landowners and communities surrounding a project. As the Commission stated in the 1999 Policy Statement:

[L]andowners whose land would be condemned for the new pipeline right-of-way, under eminent domain rights conveyed by the Commission's certificate, have an interest as does the community surrounding the right-of-way. The interest of these groups is to avoid unnecessary construction, and any adverse effects on their property associated with a permanent right-of-way. <sup>(195)</sup>

In the over 20 years that have passed since issuance of the 1999 Policy Statement, the Commission has seen an increase in proposals for projects in more densely populated areas, as well as a significant increase in comments from landowners raising a multitude of economic, environmental, and others concerns with proposed projects.

78. While the 1999 Policy Statement focused primarily on the economic impact associated with a permanent right-of-way on a landowner's property, <sup>(196)</sup> going forward, and as discussed below, our analysis of impacts to landowners will be more expansive. This fuller consideration of landowner impacts is consistent with the Commission's approach in recent years of more fully engaging with landowners to ensure that their concerns are properly considered in our proceedings. For example, in June 2021, the Commission established OPP, in part, to facilitate public participation in Commission proceedings.

79. In addition to the increase in comments from landowners since issuance of the 1999 Policy Statement, the Commission has also seen a significant increase in comments raising environmental justice concerns. In recent years, issues surrounding environmental justice and equity have received increased focus and attention at both the State and Federal levels, as demonstrated by the recent issuance of Executive Orders 13985 and 14008, referenced above. <sup>(197)</sup> The Commission is committed to ensuring that environmental justice and equity concerns are better incorporated into our decision-making processes. Accordingly, we clarify that our consideration of impacts to communities surrounding a proposed project will include an assessment of impacts to any environmental justice communities and of necessary mitigation to avoid or lessen those impacts.

80. The Commission and applicants have a shared responsibility to engage communities that may be impacted by a proposed project. This responsibility includes ensuring effective communication with landowners and environmental justice communities about potential impacts and giving careful consideration to the input of such parties during the agency proceeding. Below, we further discuss our expectations for how pipeline applicants will engage with landowners, steps the Commission has taken to protect landowner interests, and how the Commission will consider potential impacts to landowners and environmental justice communities.

#### i. Impacts on Landowners

81. As noted above, once the Commission grants a certificate of public convenience and necessity, section 7(h) of the NGA authorizes a certificate holder to acquire the necessary land or property to construct the approved facilities by exercising the right of eminent domain for those lands for which it could not negotiate an easement with landowners. <sup>(198)</sup> As the Commission has previously recognized:

[t]here is no question that eminent domain is among the most significant actions that a government may take with regard to an individual's private property. And the harm to an individual from having their land condemned is one that may never be fully remedied, even in the event they receive their constitutionally-required compensation. <sup>(199)</sup>

Thus, looking only at the economic impacts associated with eminent domain does not sufficiently account for the full scope of impact on landowners. Landowners whose property is subject to eminent domain often experience intangible impacts, which cannot always be monetized. Our consideration of landowner impacts will be based upon robust early engagement with all interested landowners, as well as continued evaluation of input from such parties during the course of any given proceeding. And we will, to the extent possible, assess a wider range of landowner impacts.

82. Given the serious impacts associated with the use of eminent domain, we expect pipeline applicants to take all appropriate steps to minimize the future need to use eminent domain. This includes engaging with the public and interested stakeholders during the planning phase of projects to solicit input on route concerns and incorporate reroutes, where practicable, to address landowner concerns, as well as providing landowners with all necessary information. Additionally, we expect pipelines to take seriously their obligation to attempt to negotiate easements respectfully and in good faith with impacted landowners. The Commission will look unfavorably on applicants that do not work proactively with landowners to address concerns.

83. Additionally, we note that that, while a certificate provides the holder with significant rights and privileges, it also imposes concomitant responsibilities, including complying with all certificate conditions. Specifically, certificate holders must comply with requirements regarding restoration of the pipeline right-of-way. Failure to comply with such requirements could mean that a pipeline is out of compliance with its certificate, and could lead to compliance action by the Commission, including referral to the Commission's Office of Enforcement for further investigation and potential civil penalties. <sup>(200)</sup>

84. Although the Commission does not have the authority to deny or restrict the power of eminent domain in a section 7 certificate, <sup>(201)</sup> or to oversee the acquisition of property rights through eminent domain, including issues regarding the timing of and just compensation for the acquisition of property rights, <sup>(202)</sup> the Commission has recently taken steps within its authority to protect landowner interests. Specifically, the Commission issued Order No. 871-B, which precludes authorization of construction during the rehearing period for certificate orders and pending resolution of rehearing requests reflecting opposition to project construction, operation, or need (subject to a time limitation), and which establishes a general policy, subject to a case-by-case determination, of staying certificate orders during the rehearing period and pending Commission resolution of any timely requests for rehearing filed by landowners (also subject to a time limitation). <sup>(203)</sup>

85. We acknowledge that in many cases pipeline applicants will not be able to acquire all the necessary right-of-way by negotiation and in such instances may need to use eminent domain. In assessing potential impacts to landowners, the Commission will consider the steps a pipeline applicant has already taken to acquire lands through respectful and good faith negotiation, as well as the applicant's plans to minimize the use of eminent domain upon receiving a certificate. And, as discussed further below, the potential adverse impacts to landowners, along with other adverse impacts, will be weighed against the evidence of need and potential benefits of a proposal in determining whether to issue a certificate of public convenience and necessity.

## ii. Impacts on Environmental Justice Communities

86. Our evaluation of the impacts of a proposed interstate natural gas pipeline will include a robust consideration of its impacts on environmental justice communities. <sup>(204)</sup> We recognize that environmental justice communities have long borne a disproportionate share of the impacts associated with industrial development near their residences, workplaces, religious institutions, and schools. That history often comes with significant, deleterious consequences. For example, environmental justice communities frequently experience health disparities, such as higher rates of asthma and certain cancers relative to society at large, which can render individuals in those communities particularly susceptible to incremental pollution and other adverse impacts that may be caused by a new project. <sup>(205)</sup> The Commission's public interest responsibility demands that we seriously evaluate these considerations and incorporate them into the balancing test outlined below. <sup>(206)</sup>

87. For the Commission to adequately evaluate the impacts of a proposed project on environmental justice communities, it is essential to promptly and properly identify such communities. Commenters noted the insufficiency of relying only on initial screening tools to identify environmental justice communities. <sup>(207)</sup> While data from screening tools such as the EPA's EJSCREEN may be useful, additional data collection methods may be necessary to properly identify environmental justice communities. We encourage applicants to consult with guidance provided by EPA, CEQ, and other authoritative sources, <sup>(208)</sup> to ensure that the Commission has before it all the data needed to adequately identify environmental justice communities potentially affected by a proposed project. We will evaluate and incorporate, as appropriate, any subsequently issued guidance when considering how to identify environmental justice communities affected by a proposed project. We encourage project developers to do the same.

88. Many commenters encourage the Commission to factor in demographic considerations—such as disability, age, household income, pre-existing health conditions, and level of education. <sup>(209)</sup> We recognize that such demographic considerations may be appropriate to consider on a project-by-project basis or as Federal guidance evolves.

89. Additionally, we recognize that proper selection of both the geographic unit of analysis ( *e.g.*, census block group) within the affected environment and the reference community ( *e.g.*, county/parish, or State) is necessary to ensure that affected environmental justice communities are properly identified for consideration in the Commission's analysis. <sup>(210)</sup> The affected environment for environmental justice analysis purposes may vary according to the characteristics of the particular project and the surrounding communities. <sup>(211)</sup> Accordingly, the Commission will ensure that the delineation of the affected area, selected geographic unit of analysis, and reference community are consistent with best practices and Federal guidance and will not be limited to a one-size-fits-all approach. <sup>(212)</sup>

90. The consideration of cumulative impacts <sup>(213)</sup> is particularly important when it comes to conducting an environmental justice analysis. <sup>(214)</sup> An environmental analysis that, for example, considers incremental impacts of a project in isolation will, almost by definition, fail to adequately consider the project's impact on a community that already experiences elevated levels of pollution or other adverse impacts. To adequately capture the effects of cumulative impacts, it is essential that the Commission consider those pre-existing conditions and how the adverse impacts of a proposed project may interact with and potentially exacerbate them. To that end, several commenters provide recommendations for specific health and environmental indicators that the Commission should consider when it evaluates cumulative exposures. These include factors such as air pollution, heat vulnerability, as well as the effects of pre-existing infrastructure ( *e.g.*, bus depots, highways, and waste facilities). <sup>(215)</sup> That analysis can be informed by a wide range of data, including, for example, health statistics such as cancer clusters, asthma rates, social vulnerability data, and

community resilience data. <sup>(216)</sup> We will carefully examine cumulative impacts on environmental justice communities and encourage applicants to identify and submit any such data that may be relevant for the particular environmental justice communities affected by their proposed project.

91. The Commission will also consider measures to eliminate or mitigate a project's adverse impacts on environmental justice communities. We recognize that mitigation must be tailored to the needs of different environmental justice communities. This will require close consultation between the project developer, the communities in question, and the Commission, consistent with our *ex parte* regulations. <sup>(217)</sup> We will look with disfavor on mitigation proposals that are proposed without sufficient community input. In addition, we note that effective mitigation will require the Commission to consider, among other things, the feasibility of proposed mitigation and methods for ensuring compliance, the timing of proposed mitigation, and, where useful, a range of potential mitigation options.

92. As described above, in June 2021, the Commission established OPP to help facilitate public participation in Commission proceedings. We anticipate that OPP will similarly play an important role in ensuring that environmental justice communities are able to participate meaningfully in section 7 certificate proceedings that affect their interests. We also recognize the adverse impacts that natural gas infrastructure can have on Native American Tribes and Tribal resources, and we will continue to review our existing processes to ensure that the Commission is engaging in effective government-to-government consultation with Tribes and receiving and considering Tribal input on proposals.

93. In sum, we recognize that “environmental justice is not merely a box to be checked” <sup>(218)</sup> and we commit to ensuring that such concerns are fully considered in our public interest analysis under NGA section 7. We expect the principles and concerns outlined above will guide that consideration as the Commission continues to develop its environmental justice precedent. Finally, as noted above, we recognize that Federal agencies, including EPA and CEQ, are in the process of updating their guidance regarding environmental justice and we will review and incorporate, as appropriate, any future guidance in our case-by-case decision-making process.

#### B. Assessing Public Benefits and Adverse Effects

94. In deciding whether to issue a certificate of public convenience and necessity, the Commission must decide whether, on balance, the project will serve the public interest. In order to make such a determination, the Commission must consider all of the benefits of a proposal together with all of the adverse impacts, including the economic and environmental impacts.

95. As discussed above, under the 1999 Policy Statement, the Commission would first determine whether, given an applicant's efforts to mitigate or minimize impacts, there would be any residual adverse effects on the economic interests of the existing customers of the pipeline applicant, existing pipelines in the market and their captive customers, or landowners and communities affected by the proposal. If so, the Commission would balance the evidence of public benefits to be achieved by the project against those residual adverse effects on economic interests. If the benefits outweighed the adverse economic effects, the Commission would then consider the environmental impacts associated with the proposal. <sup>(219)</sup>

96. As noted above, today, the Commission and staff review the economic and environmental impacts of projects concurrently. Thus, the sequential framing of these analyses in the 1999 Policy Statement has created some confusion and incorrectly conveyed how the Commission considers economic and environmental impacts. Accordingly, to provide clarity regarding our decision-making process, we explain that, in order to determine whether a proposed project is in the public interest, we must look at the entirety of a proposal and balance all its benefits against all of its adverse impacts.

97. In assessing the public benefits of a project, the Commission intends to consider all benefits that will be provided by the project. The most important consideration in assessing benefits will be the evidence demonstrating that a project is needed, as discussed in more detail above. The Commission will also consider any benefits beyond demand that are alleged by the applicant and supported in the record, which may include evidence that the project will displace more pollution-heavy generation sources, facilitate the integration of renewable energy sources, and/or result in a significant source of jobs or tax revenues (we note that temporary impacts associated with a proposal will generally be given less weight).

98. In assessing the adverse impacts of a proposal, we will consider the range of impacts to: (1) Existing customers of the pipeline applicant; (2) existing pipelines in the market and their captive customers; (3) environmental resources; and (4) landowners and surrounding communities, including environmental justice communities. In reviewing those adverse impacts, the Commission will carefully consider the extent to which an applicant will be able to mitigate any adverse impacts through applicant-proposed measures or additional measures that the Commission could require.

99. Consistent with the 1999 Policy Statement, we believe that “[t]he more interests adversely affected or the more adverse impact a project would have on a particular interest, the greater the showing of public benefits from the project required to balance the adverse impact.”<sup>(220)</sup> And, as the Commission did in the 1999 Policy Statement, we decline to adopt any bright-line standards for how we will carry out this balancing;<sup>(221)</sup> rather, the approach must remain flexible enough for the Commission to resolve specific cases and take into account the different interests that must be considered. We do make clear, however, that there may be proposals denied solely on the magnitude of a particular adverse impact to any of the four interests described above if the adverse impacts, as a whole, outweigh the benefits of the project and cannot be mitigated or minimized. On the other hand, there may be proposals that have significant impacts but are still found to be in the public interest if the public benefits outweigh those impacts.

## V. Applicability of the Updated Certificate Policy Statement

100. A major purpose of this Updated Policy Statement is to provide clarity and regulatory certainty regarding the Commission's decision-making process. Therefore, the Updated Policy Statement will not be applied retroactively to cases where a certificate has already been issued and investment decisions have been made. However, the Commission will apply the Updated Policy Statement to any currently pending applications for new certificates. Applicants will be given the opportunity to supplement the record and explain how their proposals are consistent with this Updated Policy Statement, and stakeholders will have an opportunity to respond to any such filings.

## VI. Information Collection Statement

101. The collection of information discussed in the Updated Policy Statement is being submitted to the Office of Management and Budget (OMB) for review under section 3507(d) of the Paperwork Reduction Act of 1995<sup>(222)</sup> and OMB's implementing regulations.<sup>(223)</sup> OMB must approve information collection requirements imposed by agency rules.<sup>(224)</sup> Respondents will not be subject to any penalty for failing to comply with a collection of information if the collection does not display a valid OMB control number.

102. The Commission solicits comments from the public on the Commission's need for this information, whether the information will have practical utility, the accuracy of the burden estimates, recommendations to enhance the quality, utility, and clarity of the information to be collected, and any suggested methods for minimizing respondents' burden, including the use of automated information techniques. *Public comments are due* May 2, 2022. The burden estimates are focused on implementing the voluntary information collection pursuant to this Updated Policy Statement. The Commission asks that any revised burden estimates submitted by commenters include the details and assumptions used to generate the estimates.

103. The following estimate of reporting burden is related only to this Updated Policy Statement.

104. *Public Reporting Burden:* The collection of information related to this Updated Policy Statement falls under FERC-537 and impacts the burden estimates associated with the “Interstate Certificate and Abandonment Applications” component of FERC-537. The Updated Policy Statement will not impact the burden estimates related to any other component of FERC-537. <sup>(225)</sup> The estimated annual burden <sup>(226)</sup> and cost <sup>(227)</sup> follow.

Modifications to FERC-537 (Gas Pipeline Certificates: Construction, Acquisition, and Abandonment)

as a Result of PL18-1-000

	<b>Number of respondents</b>	<b>Annual number of responses per respondent</b>	<b>Total number of responses</b>	<b>Average burden &amp; cost per response</b>	<b>Total annual burden hours &amp; total annual cost</b>	<b>Cost per respondent(\$)</b>
	(1)	(2)	(1) * (2) = (3)	(4)	(3) * (4) = (5)	(5) ÷ (1)
Interstate Certificate and Abandonment Applications	40	1	40	880 hours; \$76,560 Increase	35,200 hours; \$3,062,400 Increase	\$76,560 Increase.

105. *Title:* FERC-537, Gas Pipeline Certificates: Construction, Acquisition and Abandonment.

106. *Action:* Proposed revisions to an existing information collection.

107. *OMB Control No.:* 1902-0060.

108. *Respondents:* Entities proposing natural gas projects under section 7 of the NGA.

109. *Frequency of Information Collection:* On occasion.

110. *Necessity of Voluntary Information Collection:* The Commission's existing FERC-537 information collection pertains to regulations implementing section 7 of the NGA, which authorizes the Commission to issue certificates of public convenience and necessity for the construction and operation of facilities transporting natural gas in interstate commerce. The information collected pursuant to this Updated Policy Statement should help the Commission in making its public interest determinations.

111. *Internal Review:* The opportunity to file the information conforms to the Commission's plan for efficient information collection, communication, and management within the natural gas pipeline industry. The Commission has assured itself, by means of its internal review, that there is specific, objective support for the burden estimates associated with the opportunity to file the information.

112. Interested persons may provide comments on this information collection by one of the following methods:

- *Electronic Filing (preferred)*: Documents must be filed in acceptable native applications and print-to-PDF, but not in scanned or picture format.
- *USPS*: Federal Energy Regulatory Commission, Office of the Secretary, 888 First Street NE, Washington, DC 20426.
- *Hard copy other than USPS*: Federal Energy Regulatory Commission, Office of the Secretary, 12225 Wilkins Avenue, Rockville, Maryland 20852.

## VII. Document Availability

113. In addition to publishing the full text of this document in the Federal Register , the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the internet through the Commission's Home Page ( <http://www.ferc.gov> ). At this time, the Commission has suspended access to the Commission's Public Reference Room due to the President's March 13, 2020 proclamation declaring a National Emergency concerning the Novel Coronavirus Disease (COVID-19).

114. From the Commission's Home Page on the internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

115. User assistance is available for eLibrary and the Commission's website during normal business hours from the Commission's Online Support at (202) 502-6652 (toll free at 1-866-208-3676) or email at [ferconlinesupport@ferc.gov](mailto:ferconlinesupport@ferc.gov), or the Public Reference Room at (202) 502-8371, TTY (202) 502-8659. Email the Public Reference Room at [public.referenceroom@ferc.gov](mailto:public.referenceroom@ferc.gov).

*By the Commission.* Commissioner Danly is dissenting with a separate statement attached.

Commissioner Christie is dissenting with a separate statement attached.

Issued: February 18, 2022.

Kimberly D. Bose,  
Secretary.

## DEPARTMENT OF ENERGY FEDERAL ENERGY REGULATORY COMMISSION

Certification of New Interstate Natural Gas Facilities

Docket No. PL18-1-000

DANLY, Commissioner, *dissenting*:

1. I dissent from the issuance of the *Updated Policy Statement on Certification of New Interstate Natural Gas Facilities*.<sup>(1)</sup> Before I explain my reasons for dissenting, I would like to state from the outset that I voted for the Commission's most recent revised Notice of Inquiry<sup>(2)</sup> considering changes to its Original Policy Statement.<sup>(3)</sup>

2. I cannot, however, support today's issuance because it will, in combination with the Interim Greenhouse Gas (GHG) Policy Statement,<sup>(4)</sup> have profound implications for the ability of natural gas companies to secure capital, on the timelines for Natural Gas Act (NGA) section 7<sup>(5)</sup> applications to be processed, and on the costs that a pipeline and its customers will bear as a result of the potentially unmeasurable mitigation that the majority *expects* each company to propose when filing its application<sup>(6)</sup> and the possibility of

further mitigation measures added unilaterally by the Commission. As I explain in more detail below, this policy statement contravenes the purpose of the NGA which, as the Supreme Court has held, is to “encourage the orderly development of plentiful supplies of . . . natural gas at reasonable prices.” (7)

## I. The Commission's Jurisdiction and the Public Convenience and Necessity Standard Are Not as Broad as the Updated Policy Statement Suggests

3. As an initial matter, the Commission “is a ‘creature of statute,’ having ‘no constitutional or common law existence or authority, but *only* those authorities conferred upon it by Congress.’” (8) The applicable statute is the NGA, and the statutory standard applicable to NGA section 7(c) certificate applications (9) is whether a proposed project “is or will be required by the present or future public convenience and necessity.” (10)

4. Notably, *public convenience and necessity* is not anywhere defined in the language of the NGA. (11) That phrase is famously ambiguous, and the statute fails to provide factors to be weighed in arriving at a determination that a proposed project “is or will be required by the present or future public convenience and necessity.” (12) Accordingly, “the Natural Gas Act ‘vests the Commission with broad discretion to invoke its expertise in balancing competing interests and drawing administrative lines.’” (13) This does not, of course, mean that we are wholly without guideposts in construing the meaning of the public convenience and necessity standard. As recognized by my colleagues, the Supreme Court has found that NGA section “7(e) requires the Commission to evaluate all factors bearing on the public interest.” (14) This finding, however, cannot not be read in a vacuum. The Court has explained that the inclusion of the phrase “public interest” in a statute is not “a broad license to promote the general public welfare”—instead, it “take[s] meaning from the purposes of the regulatory legislation.” (15) Thus, we turn, as we must, to the purpose of the NGA: “to encourage the orderly development of plentiful supplies of . . . natural gas at reasonable prices.” (16) Any balancing under the public convenience and necessity standard should “take meaning” from that purpose.

5. We also know that “[n]othing contained in [NGA section 7] shall be construed as a limitation upon the power of the Commission to grant certificates of public convenience and necessity for service of an area already being served by another natural-gas company.” (17) Therefore, the Commission is not barred from finding a proposed project required by the public convenience and necessity when it is in an area that is already served by another company. (18)

6. Another consideration relevant to the Commission's evaluation of the public interest is our jurisdiction and, specifically, which areas of regulation Congress identified as being reserved to states—and thus outside of our jurisdiction. NGA section 1(b) sets forth that division of jurisdiction, providing that,

[t]he provisions of [the NGA] shall apply to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale, and to the importation or exportation of natural gas in foreign commerce and to persons engaged in such importation or exportation, but *shall not apply to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities used for such distribution or to the production or gathering of natural gas.* (19)

The Commission's authority therefore extends to: (1) The “transportation of natural gas in interstate commerce,” (2) the “sale in interstate commerce of natural gas for resale,” and (3) “natural-gas companies engaged in such transportation or sale.” (20) Exempted from our jurisdiction are production, gathering and local distribution. (21) From these exemptions, it may be gleaned that the Commission does not have jurisdiction over the “gas once it moves beyond the high-pressure mains into the hands of an end user.” (22) Another exemption from federal regulation is contained in NGA section 1(c), which states:

The provisions of this chapter shall not apply to any person engaged in or legally authorized to engage in the transportation in interstate commerce or the sale in interstate commerce for resale, of natural gas received by such person from another person within or at the boundary of a State if all the natural gas so received is ultimately consumed within such State, or to any facilities used by such person for such transportation or sale, provided that the rates and service of such person and facilities be subject to regulation by a State commission. <sup>(23)</sup>

By declaring the foregoing exemptions from federal regulation, Congress has carefully delineated the limits of the Commission's jurisdiction. <sup>(24)</sup>

7. These limits on the Commission's jurisdiction are not extended by the National Environmental Policy Act (NEPA). <sup>(25)</sup> In fact, NEPA cannot extend our jurisdiction because NEPA is not a means of "mandating that agencies achieve particular substantive environmental results"; <sup>(26)</sup> rather, it serves to "impose[ ] only procedural requirements on federal agencies with a particular focus on requiring agencies to undertake analyses of the environmental impact of their proposals and actions." <sup>(27)</sup> Indeed, "NEPA not only does not require agencies to discuss any particular mitigation plans that they might put in place, it does not require agencies—or third parties—to effect any." <sup>(28)</sup> It is necessary to acknowledge the limited, procedural nature of NEPA's requirements since it almost appears as though some of my colleagues have become convinced that it is necessary to ensure that environmental impacts are mitigated before one can make a finding that a proposed project is required by the public convenience and necessity. <sup>(29)</sup> Neither NEPA nor the NGA establishes such a requirement.

8. And, any attempt to justify such action through the Commission's conditioning authority is unsupported. <sup>(30)</sup> Under its conditioning authority, "[t]he Commission shall have the power to attach to the issuance of the certificate and to the exercise of the rights granted thereunder such reasonable terms and conditions as the public convenience and necessity may require." <sup>(31)</sup> But the Commission's conditioning authority cannot be used to impose conditions beyond the Commission's jurisdiction. <sup>(32)</sup> Nor can the Commission find support under NEPA for its expectation that applicants propose mitigation measures in order for a project to be deemed required by the public convenience and necessity. <sup>(33)</sup>

## II. A Number of the Changes to the Certificate Policy Statement Are Misguided

### • Changes in the Commission's Need Determination

9. In the Original Policy Statement, the Commission stated that, in evaluating the need for a project, it would:

consider all relevant factors reflecting on the need for the project. These might include, but would not be limited to, precedent agreements, demand projections, potential cost savings to consumers, or a comparison of projected demand with the amount of capacity currently serving the market. The objective would be for the applicant to make a sufficient showing of the public benefits of its proposed project to outweigh any residual adverse effects discussed below. <sup>(34)</sup>

Although the Commission stated in its Original Policy Statement that it would consider other factors, the Commission has also "explained that the [Original] Policy Statement does not require a certain percentage of a proposed project's capacity be subscribed, and that with respect to affiliate shippers, 'it is . . . Commission policy to not look beyond precedent or service agreements to make judgments about the needs of individual shippers.'" <sup>(35)</sup>

10. In the Updated Policy Statement, the Commission now is revising how it determines need. The Updated Policy Statement explains that "[i]n determining whether to issue a certificate of public convenience and necessity, the Commission will weigh the public benefits of a proposal, *the most important of which is the*

need that will be served by the project, against its adverse impacts.”<sup>(36)</sup> The Commission acknowledges that its prior reliance on precedent agreements to determine need has been upheld by courts,<sup>(37)</sup> but then proclaims that “we cannot adequately assess project need without also looking at evidence beyond precedent agreements.”<sup>(38)</sup> An expectation is then established that applicants continue to provide precedent agreements but “the existence of precedent agreements may not be sufficient in and of themselves to establish need for the project.”<sup>(39)</sup>

11. The Commission underscores what it views as necessary for the Commission to determine need for all categories of proposed projects: “specific information detailing how the gas to be transported by the proposed project will ultimately be used,” *i.e.*, the end use and, “why the project is needed to serve that use.”<sup>(40)</sup> And if the applicant does not have information regarding the intended end use? Applicants are “encouraged” to turn to their shippers to obtain it.<sup>(41)</sup> In the absence of such information, the Commission suggests that the applicant may not satisfy its burden to demonstrate need for the proposed project.<sup>(42)</sup> The projected end use and an explanation of the reasons *why* the project is needed to serve that use are not the only information the Commission requests—“[f]or all categories of proposed projects,” the majority also “encourage[s] applicants to provide specific information detailing . . . the expected utilization rate of the proposed project.”<sup>(43)</sup> The majority also suggests types of “evidence” for various categories of projects.<sup>(44)</sup>

12. And when precedent agreements are with an affiliate of the applicant, the majority states that those precedent agreements, will generally not be sufficient to demonstrate need.<sup>(45)</sup>

13. I agree that, as a legal matter, the Commission may take into account considerations other than precedent agreements in its need determination. I also agree that there may be circumstances—such as when there is evidence of self-dealing in the execution of a precedent agreement with an affiliated shipper—where “the existence of precedent agreements may not be sufficient in and of themselves to establish need for the project.”<sup>(46)</sup>

14. To the extent, however, that today's order suggests that the Commission must look beyond precedent agreements in every circumstance to determine need, I disagree. In my view, precedent agreements are strong evidence of need and the Commission need not look further in most circumstances. As my colleagues acknowledge, courts have upheld on numerous occasions the Commission's application of its Original Policy Statement and the Commission's reliance on precedent agreements to support multiple findings of market need.<sup>(47)</sup>

15. In terms of precedent agreements with affiliates, the Commission recently received guidance in the form of the narrow holding in *Environmental Defense Fund v. FERC*.<sup>(48)</sup> There, the court found the Commission's public convenience and necessity determination to be arbitrary and capricious due to the Commission's rel[iance] solely on a precedent agreement to establish market need for a proposed pipeline when (1) there was a single precedent agreement for the pipeline; (2) that precedent agreement was with an affiliated shipper; (3) all parties agreed that projected demand for natural gas in the area to be served by the new pipeline was flat for the foreseeable future; and (4) the Commission neglected to make a finding as to whether the construction of the proposed pipeline would result in cost savings or otherwise represented a more economical alternative to existing pipelines.<sup>(49)</sup>

That case does not stand for the proposition that in every circumstance, the Commission must always look beyond the precedent agreements. Instead, that case should be read as a failure on the part of the Commission to engage in reasoned decision making based on the facts presented.

16. Next, I disagree with the majority's position that the Commission should weigh end use in its determination of need. I agree with Enbridge Gas Pipeline that “[p]rioritizing certain end uses in determining project need would be inconsistent with the Commission's policies of open access, open seasons and awarding capacity to those that value the capacity the most.”<sup>(50)</sup> More importantly, the Commission does

not have jurisdiction over the end use of the gas and has been purposefully deprived of its upstream and downstream authorities by Congress. The breadth of the subject matters that inform our public interest determinations must be informed by the limits of our jurisdiction.

17. I recognize that in *Transco* the Supreme Court stated that “`end-use' . . . was properly of concern to the Commission.”<sup>(51)</sup> As commenters observe,<sup>(52)</sup> however, the *Transco* decision was made prior to Congress' enactment of the Natural Gas Policy Act of 1978 (NGPA)<sup>(53)</sup> and the Natural Gas Wellhead Decontrol Act of 1989 (Wellhead Decontrol Act).<sup>(54)</sup> These later enactments are instructive as to whether the Commission should consider end use as part of its public convenience and necessity determination.

18. The NGPA “was designed to phase out regulation of wellhead prices charged by producers of natural gas, . . . to `promote gas transportation by interstate and intrastate pipelines' for third parties”<sup>(55)</sup> and also “to provide investors with adequate incentives to develop new sources of supply.”<sup>(56)</sup> Later, the enactment of the Wellhead Decontrol Act resulted in deregulating upstream natural gas production, and the legislative history suggests the enactment would serve to encourage competition of natural gas at the wellhead.<sup>(57)</sup> In combination, these acts effectively deprived the Commission of authority upstream of the jurisdictional pipeline.

19. In 1987, Congress repealed sections of the Power Plant and Industrial Fuel Use Act of 1978 (Fuel Use Act), further deregulating downstream considerations. My former colleague, Commissioner McNamee previously explained that the Fuel Use Act had “restricted the use of natural gas in electric generation so as to conserve it for other uses” and “[w]ith the repeal of the Fuel Use Act, Congress made clear that natural gas could be used for electric generation and that the regulation of the use of natural gas by power plants unnecessary.”<sup>(58)</sup> A House report stated:

By amending [the Fuel Use Act], H.R. 1941 will remove artificial government restrictions on the use of oil and gas; allow energy consumers to make their own fuel choices in an increasingly deregulated energy marketplace; encourage multifuel competition among oil, gas, coal, and other fuels based on their price, availability, and environmental merits; preserve the `coal option' for new baseload electric powerplants which are long-lived and use so much fuel; and provide potential new markets for financially distressed domestic oil and gas producers.<sup>(59)</sup>

These later, deregulatory enactments were not at play in *Transco*. And I agree that “the current framework requires equal access to a plentiful gas supply for all buyers and sellers.”<sup>(60)</sup> Taking the foregoing into account, I am not convinced that the Commission has authority to deny a certificate of public convenience and necessity on the basis of end use, and the Commission should not consider end use in its need determination.

#### b. Consideration of Adverse Effects

20. The Commission explains in its Updated Policy Statement that it will consider four categories of adverse impacts from the construction and operation of new projects: (1) The interests of the applicant's existing customers; (2) the interests of existing pipelines and their captive customers; (3) environmental interests; and (4) the interests of landowners and surrounding communities, including environmental justice communities.<sup>(61)</sup> The Commission also states that it may deny an application based on any of the foregoing types of adverse impacts.<sup>(62)</sup> Further, the Commission will “consider environmental impacts *and potential mitigation* in both our environmental reviews under NEPA and our public interest determinations under the NGA.”<sup>(63)</sup> And the Commission “expects applicants to structure their projects to avoid, or minimize, potential adverse environmental impacts.”<sup>(64)</sup>

21. First, regarding the interests of the applicant's existing customers, the Commission announces that while our policy of no financial subsidies remains unchanged, the Commission will no longer treat this as a threshold requirement.<sup>(65)</sup> This reprioritization is fine; it is merely a policy choice with no obvious legal

infirmary.

22. Next, the Commission turns to its considerations of existing pipelines and their customers with an emphasis on the prevention of overbuilding. In an order clarifying the Original Policy Statement, the Commission discussed the consideration of overbuilding and explained that “[s]ending the wrong price signals to the market can lead to inefficient investment and contracting decisions which can cause pipelines to build capacity for which there is not a demonstrated market need,” and that “[s]uch overbuilding, in turn, can exacerbate adverse environmental impacts, distort competition between pipelines for new customers, and financially penalize existing customers of expanding pipelines and customers of the pipelines affected by the expansion.” <sup>(66)</sup> I agree that the concern of overbuilding is worthy of consideration in the Commission's balancing and consistent with the purpose of “encourag[ing] the *orderly development* of plentiful supplies of . . . natural gas at reasonable prices.” <sup>(67)</sup>

23. The Commission also states that “[t]o the extent that a proposed project is designed to substantially serve demand already being met on existing pipelines, that could be an indication of potential overbuilding.” <sup>(68)</sup> In my view, the Commission should weigh this consideration with NGA section 7(g) in mind, which provides that “[n]othing contained in [NGA section 7] shall be construed as a limitation upon the power of the Commission to grant certificates of public convenience and necessity for service of an area already being served by another natural-gas company.” <sup>(69)</sup> In considering whether a proposed project is designed to substantially serve demand that is already met, the Commission should also consider whether the proposed project would allow for further competition, send appropriate price signals and improve the efficiency or reliability of service to existing customers. This is worth noting because of the statement in today's order that states that “[t]he Commission may deny an application based on *any* of these types of adverse impacts,” <sup>(70)</sup> including impacts to existing pipelines and their customers.

24. Third, the majority addresses environmental impacts, stating: “While the 1999 Policy Statement focused on economic impacts, the consideration of environmental impacts is an important part of the Commission's responsibility under the NGA to evaluate all factors bearing on the public interest.” <sup>(71)</sup> As explained by the majority, the Original Policy Statement “included an analytical framework for how the Commission would evaluate the effects of certificating new projects on economic interests,” and it “did not describe how the Commission would consider environmental interests in its decision-making process and, more specifically, how it would balance these interests with the economic interests of a project.” <sup>(72)</sup> The Commission now adjusts that framework to include environmental impacts as a consideration in its Updated Policy Statement.

25. The Commission explains that it will consider environmental impacts and potential mitigation in both our environmental reviews under NEPA and our public interest determinations under the NGA. <sup>(73)</sup> The majority “expect[s] applicants to propose measures for mitigating impacts,” for consideration in the Commission's balancing of adverse impacts against the potential benefits of a proposal. <sup>(74)</sup> The Commission may condition the certificate with further mitigation. <sup>(75)</sup> Moreover, the Commission states that it may “deny an application based on . . . environmental impacts, if the adverse impacts as a whole outweigh the benefits of the project and cannot be mitigated or minimized.” <sup>(76)</sup> Finally, the majority indicates its intent when making its public convenience and necessity determination to fully consider climate impacts. <sup>(77)</sup>

26. I discuss the reasons why I disagree with the majority's Interim GHG Policy Statement in my dissent to that order. <sup>(78)</sup> In terms of the change from an economic focus in the Original Policy Statement, my view is that the Commission should retain its economic framework as the basis of its policy statement. I am concerned that several of the changes made in today's Updated Policy Statement include issues outside the scope of that which the Commission is able to consider under the NGA. Though time has passed since the NGA's enactment, it is Congress' role to amend the statute should it see fit to include in the Commission's authority matters such as the conditioning of certificates to mitigate GHG emissions.

Congress has done so before and could do so again. <sup>(79)</sup> To restate the approach that should be taken to determine the public convenience and necessity: Any balancing under that standard must “take meaning” from the interests articulated in the NGA.

27. Although courts have recognized that the Commission's NGA section 7(e) “conditioning authority is ‘extremely broad,’” <sup>(80)</sup> such authority is not without limit. “The Commission may not, however, when it lacks the power to promote the public interest directly, do so indirectly by attaching a condition to a certificate that is, in unconditional form, already in the public convenience and necessity.” <sup>(81)</sup> There have been circumstances where the courts have found the Commission exceeded its conditioning authority. <sup>(82)</sup> Its use must be consistent with the other provisions of the NGA and the Commission may not use conditions under the guise of acting in the public interest in order to do something it would otherwise not have authority to do.

28. There are also practical considerations in the Commission finding in today's policy statement that “[s]hould [the Commission] deem an applicant's proposed mitigation of impacts inadequate to enable us to reach a public interest determination, we may condition the certificate to require additional mitigation.” <sup>(83)</sup> The costs that attend the proposed mitigation of GHG emissions may be unmeasurable, may not be readily apparent, and may also be more than the natural gas companies and its shippers are willing or able to bear. There will perhaps be difficulty in measuring the costs of conditions, such as market-based mitigation, <sup>(84)</sup> when the costs are determined based on a changing market. For instance, the cost of purchasing renewable energy credits may be different at the time an application is filed in comparison to when the certificate is issued. And there is no guarantee that the potentially extraordinary costs incurred by a pipeline to comply with the Commission's public interest determination will be recovered in the pipeline's rates. <sup>(85)</sup> These practical considerations have not been taken into account by the Commission. Without these considerations, I am not convinced that the Commission has engaged in reasoned decision making.

29. Turning to the Commission's consideration of impacts on landowners and surrounding communities, as the majority recognizes, the Original Policy Statement's primary focus was on economic impacts associated with a permanent right-of-way on a landowner's property. <sup>(86)</sup> Going forward, the consideration “of impacts to landowners will be more expansive.” <sup>(87)</sup> The majority clarifies that the “consideration of impacts to communities surrounding a proposed project will include an assessment of impacts to any environmental justice communities and of necessary mitigation to avoid or lessen those impacts.” <sup>(88)</sup> And “expectations” are established “for how pipeline applicants will engage with landowners.” <sup>(89)</sup>

30. The majority also commits itself to “robust early engagement with all interested landowners, as well as continued evaluation of input from such parties during the course of any given proceeding” and states that the Commission “will, to the extent possible, assess a wider range of landowner impacts.” <sup>(90)</sup> Further, the majority states that it “expect[s] pipeline applicants to take all appropriate steps to minimize the future need to use eminent domain,” including “engage[ment] with the public and interested stakeholders during the planning phase of projects to solicit input on route concerns and incorporate reroutes, where practicable, to address landowner concerns, as well as providing landowners with all necessary information.” <sup>(91)</sup>

31. The majority states that it “expect[s] pipelines to take seriously their obligation to attempt to negotiate easements respectfully and in good faith with impacted landowners” and indicates that “[t]he Commission will look unfavorably on applicants that do not work proactively with landowners to address concerns.” <sup>(92)</sup> Does this mean that the majority plans to weigh, in its balancing of interests, allegations concerning whether the applicant has engaged in good faith negotiation of easements and collaboration with landowners to address concerns? It appears so. The Commission later states that “[i]n assessing potential impacts to landowners, the Commission will consider the steps a pipeline applicant has already taken to acquire lands through respectful and good faith negotiation, as well as the applicant's plans to minimize the use of eminent domain upon receiving a certificate.” <sup>(93)</sup>

32. It is worth reminding my colleagues that on the very same meeting that this order is issued, the Commission also issues an order <sup>(94)</sup> that reaffirms a decision to deny landowners' request for the Commission to interpret the scope of NGA section 7(h) because, in my colleagues' view, NGA section 7(h) is "a provision that gives courts a particular implementing role" and therefore "is better resolved by the courts than the Commission." <sup>(95)</sup> And yet here, the Commission contemplates considering in its balancing whether applicants have engaged in good faith negotiations for easements pursuant to NGA section 7(h).

33. Finally, the Commission discusses how it will consider impacts to environmental justice communities. In explaining its objectives, the majority states that "[t]he consideration of cumulative impacts is particularly important when it comes to conducting an environmental justice analysis." <sup>(96)</sup> In support, the Commission has the following footnote:

"`Cumulative impact' is the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time." 40 CFR 1508.7 (1978). <sup>(97)</sup>

34. There is no problem with announcing the paradigm by which a particular type of analysis will be conducted, but this looks very much as though my colleagues have decided that they can disregard currently-effective regulations and adopt their own definition of the "effects" that should be considered in the Commission's analysis. <sup>(98)</sup> The *current* NEPA regulations repealed the definition of "Cumulative impact" previously contained in 40 CFR 1508.7. <sup>(99)</sup> The Commission, in attempting to go farther than the CEQ's regulations, reasons that "[t]o adequately capture the effects of cumulative impacts, it is essential that the Commission consider those pre-existing conditions and how the adverse impacts of a proposed project may interact with and potentially exacerbate them." <sup>(100)</sup>

35. I disagree with the Commission's decision to disregard CEQ's regulations. <sup>(101)</sup> The Commission, in its *own* regulations, states that it "will comply with the regulations of the [CEQ] except where those regulations are inconsistent with the statutory requirements of the Commission." <sup>(102)</sup> Regardless of the latitude the majority thinks we may enjoy when conducting our analyses, it is a matter of black letter law that we are constrained by our regulations which adopt CEQ's regulations; we are also unable to conjure rubrics out of thin air without explanation.

### III. The Commission's Approach of "Expecting" Self-Imposed Mitigation Appears Calculated To Circumvent Statutory Limits on the Commission's Authority

36. In the Updated Policy Statement, as well as in the Interim GHG Policy Statement, the Commission has asserted a dramatic expansion of its conditioning authority. As explained above, the Commission likely does not have the statutory authority to enter this new territory. It is not surprising, therefore, to see a consistent theme in the Updated Policy Statement that the Commission has expectations of applicants. <sup>(103)</sup> The Commission *expects* more of applicants going forward. Should those expectations not be met to the Commission's satisfaction, the Commission suggests that it will weigh that against finding that the project is required by the public convenience and necessity. <sup>(104)</sup>

37. Instead of saying that it is imposing or requiring the legally dubious conditions itself, the Commission is *expecting* the natural gas companies to play a game of "sentence first—verdict afterwards," <sup>(105)</sup> where the applicants choose their own sentence—their proposed mitigation measures—in an effort to guess at the Commission's expectations. Only then will the Commission rule on whether the project is required by the public convenience and necessity and reveal whether the proposed mitigation is sufficient.

38. It works in the Commission's favor for applicants to impose their own mitigation measures. If the applicant proposes the mitigation instead of having it imposed by the Commission, it is less likely that a court would deem such condition unreasonable or beyond the Commission's authority should it come to be challenged at all. <sup>(106)</sup> How can a condition be unreasonable or beyond the Commission's jurisdiction if it is imposed at the suggestion of the applicant—the party who needs to satisfy such conditions?

#### IV. It Is Unclear Whether the Updated Policy Statement Is Actually Binding and Whether the Commission Should Have Proceeded Through Rulemaking

39. Whether the Commission can impose mitigation as contemplated here, or whether the Commission lacks authority to do so with its conditioning authority will ultimately be addressed by the courts. I recognize the Commission's assertion that the Updated Policy Statement is not binding. <sup>(107)</sup> I question whether that is actually the case. <sup>(108)</sup>

40. Given the non-binding designation, there may indeed be well-founded concerns by parties seeking to challenge the Updated Policy Statement. <sup>(109)</sup> But as explained above, the Commission has established its *expectations* regarding what information it wants included in certificate applications and plans to apply the Updated Policy Statement to both currently-pending <sup>(110)</sup> and future applications for a certificate of public convenience and necessity. For parties hesitant to challenge a “non-binding” policy statement, I submit that a court may perhaps be receptive to arguments of aggrievement based on the interests of shippers who will now likely have to renegotiate their agreements for proposed projects with currently-pending certificate applications.

41. Moreover, natural gas companies <sup>(111)</sup> and their shippers likely have not contemplated the increased costs that will come with the Commission's new policies. It is likely that companies with pending applications have not yet presented proposals for mitigation of the proposed project's GHG emissions. But the need for developing such proposals will arise—the Commission has requested that companies with pending applications supplement their applications. <sup>(112)</sup> The resulting cost increases will, at a minimum, make these projects more expensive and thus increase pipeline rates that may ultimately be passed on to consumers. But it is entirely possible that, in at least some cases, applicants will not accept the certificate.

42. One final thought is that it may have been more appropriate for the Commission to have proceeded through rulemaking instead of through a policy statement. The Commission details the types of information that it expects to be included in applications. However, the Commission's regulations already address what the “General content[s] of [an] application” should include in 18 CFR 157.6(b). Nothing in that section supports the Commission's *expectation* for information regarding end use and proposals for mitigation measures. <sup>(113)</sup> Our regulations do state that “[a]pplications under section 7 of the Natural Gas Act shall set forth all information necessary to advise the Commission fully concerning the operation, sales, service, construction, extension, or acquisition for which a certificate is requested . . . .” <sup>(114)</sup> But nowhere do our regulations permit the Commission to add to the requirements set forth therein regarding the contents necessary for an NGA section 7(c) application. The Commission may, of course, request information from an applicant through a data request to assist with its determination of whether the project is required by the public convenience and necessity. But to *expect* (in other words require) information, such as that regarding end use and proposals for mitigation of impacts, is perhaps something that should have been done through a rulemaking. Can a party ignore the Commission's requests for additional information? Yes, but the cost would be the potential further delay to the issuance of already stalled certificates and perhaps the ultimate rejection of a proposal that fails to meet the Commission's expectations.

#### V. Today's Decision Will Have Profound Reliability Implications

43. I cannot overstate the implications of the Updated Policy Statement. <sup>(115)</sup> It will subvert the purpose of the NGA: To “encourage the orderly development of plentiful supplies of . . . natural gas at reasonable prices.” <sup>(116)</sup> Further, we leave the public and the regulated community—including investors upon whom we rely to provide billions of dollars for critical infrastructure—with profound uncertainty regarding how the Commission will determine whether a proposed project is required by the public convenience and necessity. With that uncertainty comes reliability concerns.

44. The North American Electric Reliability Corporation (NERC) recently highlighted just how important natural gas is to our electric system when it explained in its most recent Long Term Reliability Assessment that “[n]atural gas is the reliability ‘fuel that keeps the lights on,’ and *natural gas policy must reflect this reality.*” <sup>(117)</sup> Today’s issuance is unlikely to allay NERC’s reliability concerns. I began this statement with the consequences that could attend today’s issuance of the Updated Policy Statement. As a reminder those consequences include, but are not limited to, further delay in the issuance of certificates, the incurrence of unmeasurable and unrecoverable costs that may result from the Commission’s imposition of mitigation measures to address GHG and environmental justice impacts (which are now both considered in the Commission’s balancing), and difficulty in securing capital for proposed projects. It is foreseeable that the result will be to cause a reliability crisis in areas that need the gas the most. This arises because of the uncertain criteria to be applied by the Commission, the delays in obtaining the Commission’s approval, and the resulting increases in costs—including the cost of mitigation. Individually and collectively, these could be so severe that a natural gas company might be unable to accept the conditions of its certificate and proceed with a project that otherwise is needed to maintain reliability.

## VI. Conclusion

45. Many in the industry have asked for certainty. The majority says that they have provided it. <sup>(118)</sup> Regrettably, the majority is wrong on that point, as well. The only certainty to be found in the Updated Policy Statement is that confusion will reign hereafter, at the expense of those who depend on natural gas.

For these reasons, I respectfully dissent.

James P. Danly,

*Commissioner*

## DEPARTMENT OF ENERGY FEDERAL ENERGY REGULATORY COMMISSION

Certification of New Interstate Natural Gas Facilities

Docket No. PL18-1-000

CHRISTIE, Commissioner, *dissenting*:

1. Last year I voted to re-issue this Notice of Inquiry (NOI) for another round of comment <sup>(1)</sup> because I believed—and still do—that there are reasonable updates to the 1999 policy statement that would be worthwhile. <sup>(2)</sup> For example, I agree that precedent agreements between corporate affiliates, because of the obvious potential for self-dealing, should not, in and of themselves and without additional evidence, prove need. <sup>(3)</sup> I also believe that the Commission’s procedures for guaranteeing due process to affected property owners, which, as Justice Frankfurter taught, consists of the two core elements of notice and opportunity to be heard, <sup>(4)</sup> could be strengthened.

2. Unfortunately, the new certificate policy the majority approves today <sup>5</sup> does not represent a reasonable update to the 1999 statement. On the contrary, what the majority does today is arrogate to itself the power to rewrite both the Natural Gas Act (NGA) <sup>(6)</sup> and the National Environmental Policy Act (NEPA), <sup>(7)</sup> a power

that *only* the elected legislators in Congress can exercise. Today's action represents a truly radical departure from decades of Commission practice and precedent implementing the NGA.

3. The fundamental changes the majority imposes today to the Commission's procedures governing certificate applications are wrong as both law *and* policy. They clearly exceed the Commission's legal authority under the NGA and NEPA and, in so doing, violate the United States Supreme Court's major questions doctrine. <sup>(8)</sup>

4. The new policy also threatens to do fundamental damage to the nation's energy security by making it even more costly and difficult to build the infrastructure that will be critically needed to maintain reliable power service to consumers as the generation mix changes to incorporate lower carbon-emitting resources such as wind and solar. And as recent events in Europe and Ukraine graphically illustrate, America's energy security is an inextricable part of our national security. <sup>(9)</sup> The majority's proposal on GHG impacts is obviously motivated by a desire to address climate change, but will actually make it *more* difficult to expand the deployment of low or no-carbon resources, because it will make it more difficult to build or maintain the gas infrastructure essential to keep the lights on as more intermittent resources are deployed. <sup>(10)</sup> In addition to the essential need for natural gas to keep our power supply reliable, a dependable and adequate natural gas supply is critically needed for our manufacturing industries and the millions of jobs for American workers in those industries. <sup>(11)</sup>

5. And while I agree that reducing carbon emissions that impact the climate is a compelling policy goal, <sup>(12)</sup> this Commission—an administrative agency that only has the powers Congress has explicitly delegated to it—has no open-ended license under the U.S. Constitution or the NGA to address climate change or any other problem the majority may wish to address.

## I. Legal Questions

6. The long-running controversy over the role and use of GHG analyses in natural-gas facility certificate cases raises two central questions of law and a third that flows from the first two:

7. *First*, whether the Commission can use a GHG analysis to *reject* a certificate—or attach conditions (including the use of coercive deficiency letters) amounting to a *de facto* rejection by rendering the project unfeasible—based on the NGA's “public convenience and necessity” <sup>(13)</sup> provision, even when the evidence otherwise supports a finding under the NGA that the facility is both “convenient and necessary” to provide the public with essential gas supply? Today's orders assume that the answer is yes. <sup>(14)</sup>

8. *Second*, whether the Commission can, or is required to, *reject* a certificate—or attach conditions (including the use of coercive deficiency letters) amounting to a *de facto* rejection by rendering the project unfeasible—based on a GHG analysis conducted as part of an environmental review under NEPA, <sup>(15)</sup> when the certificate application would otherwise be approved as both “convenient and necessary” under the NGA? Again, today's orders assume the answer is yes. <sup>(16)</sup>

9. *Third*, which, if any, conditions related to a GHG analysis may be attached to a certificate under NGA section 7(e), <sup>(17)</sup> or demanded through the use of deficiency letters? Today's orders seem to assume that there is essentially no limit to the conditions the Commission can impose. <sup>(18)</sup>

10. As discussed below, today's orders get each of these questions wrong.

### A. The “Public Interest” in the Natural Gas Act

11. The starting point for answering all of these questions must be what “public interest” analysis the NGA empowers the Commission to make. Can the Commission's statutory responsibility to determine the “public convenience and necessity” be used to *reject* a project otherwise needed by the public based *solely* on

adverse impacts to “environmental interests” <sup>(19)</sup> (a term today's orders leave undefined but which could be reduced to an unspecified level of GHG emissions) as the Commission today asserts? <sup>(20)</sup> Or can the Commission reject a project *solely* due to “the interests of landowners and environmental justice communities” as the majority also asserts? <sup>(21)</sup> The short answer is no. There is nothing in the text or history of the NGA to support such a claim about, or application of, the Commission's public interest responsibilities under the NGA.

12. As discussed herein, any claim that a “public interest” analysis under the NGA gives FERC the authority to reject a project based solely on GHG emissions is specious and ahistorical. The history of the NGA indicates that Congress intended the statute to *promote* the development of pipelines and other natural-gas facilities. As one Federal judge has observed, “nothing in the text of [the NGA] . . . empowers the Commission to entirely deny the construction of an export terminal or the issuance of a certificate based solely on an adverse indirect environmental effect regulated by another agency.” <sup>(22)</sup>

13. I recognize that the Commission and the courts have construed “public convenience and necessity” to require the Commission to consider “all factors bearing on the public interest,” <sup>(23)</sup> but the Supreme Court has been very clear that any public interest analysis undertaken in the course of determining “public necessity and convenience” is constrained by the purposes and limitations of the statute. <sup>(24)</sup> It is not an open-ended license to use this Commission's certificating authority to promote whatever a majority of Commissioners from time to time may happen to view as the “public interest.”

14. With regard to GHG emissions that may be associated with upstream production activities or downstream distribution to, or consumption by, retail consumers, the Commission simply has *no* authority over such activities. That authority was left to the states. <sup>(25)</sup> Congress intended for the NGA to fill “a regulatory gap” over the “*interstate* shipment and sale of gas.” <sup>(26)</sup>

15. Even if the Commission were to undertake some estimate of the indirect GHG impacts of third-party activities that it has no authority to regulate, it does not follow that the Commission can then reject a certificate based on those impacts. <sup>(27)</sup> To do so would be to ignore the undeniable purpose of the NGA, which was enacted to facilitate the development and bringing to market of natural gas resources. The Commission's role under the NGA is to *promote* the development of the nation's natural gas resources and to safeguard the interests of ratepayers. <sup>(28)</sup> Any consideration of environmental impacts, while important, is necessarily subsidiary to that role. <sup>(29)</sup>

16. It is a truism that FERC is an economic regulator, *not* an environmental regulator. This Commission was not given certification authority in order to advance environmental goals; <sup>(30)</sup> it was given certification authority to *ensure the development* of natural gas resources and their availability—this includes pipeline infrastructure—at just and reasonable rates. To construe the Commission's analysis of the public convenience and necessity as a license to *prohibit* the development of *needed* natural gas resources using the public interest language in the NGA would be to negate the very legislative purpose of the statute. <sup>(31)</sup> Put another way, the premise of the NGA is that the production and transportation of natural gas for ultimate consumption by end users is socially valuable and should be promoted, not that the use of natural gas (which inevitably results in some discharge of GHGs) is inherently destructive and must be curbed, mitigated, or discouraged.

17. To those who say “well, times have changed and Congress was not thinking about climate change when it passed the NGA,” here's an inconvenient truth: *If Congress wants to change the Commission's mission under the NGA it has that power; FERC does not.*

18. Any authority to perform a public interest analysis under the NGA must be construed with reference to the animating purposes of the Act. It is not a free pass to pursue any policy objective—however important or compelling it may be—that is related in some way to jurisdictional facilities. <sup>(32)</sup> As the Court of Appeals for

the D.C. Circuit has explained:

Any such authority to consider all factors bearing on “the public interest” must take into account what “the public interest” means *in the context of the Natural Gas Act*. FERC’s authority to consider all factors bearing on the public interest when issuing certificates means authority to look into those factors which reasonably relate to the purposes for which FERC was given certification authority. *It does not imply authority to issue orders regarding any circumstance in which FERC’s regulatory tools might be useful.* <sup>(33)</sup>

19. Whereas the Commission’s role in certifying facilities under the NGA is explicit, <sup>(34)</sup> any purported authority for the Commission to regulate GHGs is conspicuously absent. The claim that the Commission can reject a needed facility due to GHG emissions using the public interest component in the NGA seems to be based on the following logic: To ascertain whether a facility serves the public convenience and necessity, the Commission must first determine whether the facility is in “the public interest,” which in turn entails considering factors such as “environmental” impacts from construction and operation of the proposed facility, as well as estimating and quantifying greenhouse gas emissions from the proposed facility, including both upstream emissions associated with gathering the gas and downstream emissions associated with its use, which the Commission is somehow empowered to deem to be too excessive to grant the certificate. <sup>(35)</sup> Suffice it to say, this tortured logic breaks apart in multiple places. <sup>(36)</sup>

20. Surely if Congress had any intention that GHG analyses should (or could) be the basis for rejecting certification of natural-gas facilities, it would have given the Commission clear statutory guidance as to when to reject on that basis. Instead, those who want the Commission to conjure up a standard on GHG emissions for deciding how much is *too much* are advocating for a standard resembling Justice Stewart’s famous method for identifying obscenity, to wit, that he could not describe it, but “I know it when I see it.” <sup>(37)</sup> And the Supreme Court eventually had the good sense to abandon that ocular standard. <sup>(38)</sup>

21. Using GHG analysis to reject a certificate implicates an important judicial doctrine used in evaluating just how far an administrative agency can go in essentially *creating* public policy without clear textual support in statutory law. Now let’s turn to that doctrine in this context.

#### B. The Major Questions Doctrine and the NGA

22. The Commission’s actions today implicate the “major questions doctrine,” which Justice Gorsuch has recently explained as follows:

The federal government’s powers . . . are not general, but limited and divided. Not only must the federal government properly invoke a constitutionally enumerated source of authority to regulate in this area or any other, it must also act consistently with the Constitution’s separation of powers. And when it comes to that obligation, this Court has established at least one firm rule: “We expect Congress to speak clearly” if it wishes to assign to an executive agency decisions “of vast economic and political significance.” We sometimes call this the major questions doctrine. <sup>(39)</sup>

In short, the major questions doctrine presumes that Congress reserves major issues to itself, so unless a grant of authority to address a major issue is explicit in a statute administered by an agency, it cannot be inferred to have been granted.

23. Whether this Commission can reject a certificate based on a GHG analysis—a certificate that otherwise would be approved under the NGA—is undeniably a major question of public policy. It will have enormous implications for the lives of everyone in this country, given the inseparability of energy security from economic security. Yet the Supreme Court has made it clear that broad deference to administrative agencies on major questions of public policy is *not* in order when statutes are lacking in any explicit statutory grant of authority. <sup>(40)</sup> “*When much is sought from a statute, much must be shown.* . . . [B]road assertions of administrative power demand *unmistakable legislative* support.” <sup>(41)</sup>

24. There is no “unmistakable legislative support” for the powers the Commission asserts today. A broad power to regulate upstream and downstream GHG emissions and their global impacts has simply *not* been delegated to this Commission. <sup>(42)</sup> To the extent the federal government has such power, it has been delegated elsewhere. “Of necessity, Congress selects different regulatory regimes to address different problems.” <sup>(43)</sup> The U.S. Environmental Protection Agency (EPA) is charged with regulating greenhouse gas emissions under the Clean Air Act. <sup>(44)</sup> By contrast, Congress established in the NGA a regulatory regime to address entirely different problems, namely, the need to develop the nation's natural gas resources and to protect ratepayers from unjust and unreasonable rates for gas shipped in the flow of interstate commerce. If it chose, Congress could enact legislation that would invest the Commission with authority to constrain the development and bringing to market of natural gas resources, but the fact is that Congress has chosen *not* to do so. On the contrary, every time Congress has enacted natural gas legislation, it has been to *promote* the development of natural gas resources, not throw up barriers to them. <sup>(45)</sup>

25. The fact that the NGA requires the Commission to make some form of public interest determination in the course of a certificate proceeding does not furnish a basis for the Commission to arrogate to itself the authority to constrain the development of natural gas resources on the grounds of their potential greenhouse gas emissions. As now-Justice Kavanaugh has explained: “If an agency wants to exercise expansive regulatory authority over some major social or economic activity . . . *regulating greenhouse gas emitters, for example* —an ambiguous grant of statutory authority is not enough. Congress must *clearly authorize* an agency to take such a major regulatory action.” <sup>(46)</sup> Congress has *not* “clearly authorize[d]” this Commission to regulate greenhouse gas emitters, nor to deny certificates to facilities whose construction and operation would be in the public convenience and necessity, simply because the construction and operation of such infrastructure may result in some amount of greenhouse gas emissions. <sup>(47)</sup> “Even if the text were ambiguous, the sheer scope of the . . . claimed authority . . . would counsel against” such an expansive interpretation. <sup>(48)</sup>

26. The fact that the Commission has absolutely no standard against which to measure the impact of natural gas production upstream or use downstream of the facilities it certifies is also important. In order for Congress to delegate any authority to an executive agency, it must legislatively set forth an intelligible principle for the agency to follow. <sup>(49)</sup> There is no such “intelligible principle” for the Commission to follow when it comes to greenhouse gas emissions.

27. Although the NGA requires the Commission to determine whether a proposed facility is in the “public convenience and necessity,” the term “has always been understood to mean ‘need’ for the service. To the extent the environment is considered, such consideration is limited to the effects stemming from the construction and operation of the proposed facilities.” <sup>(50)</sup> The term “public convenience and necessity” has long been understood to refer most essentially to the public's need for service on terms that are just and reasonable, *i.e.*, that are low enough for the public to pay the rates and high enough for the provider to maintain a profitable business. <sup>(51)</sup> That understanding was reflected in various statutes employing the term, including the Natural Gas Act. <sup>(52)</sup> And it was further reflected in the earliest “public convenience and necessity” analyses under the NGA. <sup>(53)</sup>

28. To summarize: Whether and how to regulate GHG emissions is a major question of vast economic and political significance. Congress has not explicitly authorized the Commission to regulate in this area as required under the major questions doctrine, nor has it laid down an intelligible principle for the Commission to follow as required by the non-delegation doctrine. Moreover, EPA, in coordination with the states, already has authority to regulate in this area as specified in Federal statutes, which is far removed from this Commission's core expertise and traditional responsibilities.

29. Let's now turn to the second major question.

### C. GHG Analysis Under NEPA

30. Is this Commission required or allowed by NEPA <sup>(54)</sup> to *reject* a certificate for a natural gas facility— *one that would otherwise be approved under the NGA* —based on a GHG analysis conducted as part of the NEPA environmental review? And rejection includes attaching mitigation conditions so onerous (or coercing through deficiency letters) that they render the project unfeasible. <sup>(55)</sup>

31. Again, the short answer is no. NEPA does not contain a shred of specific textual authority requiring or allowing the Commission to *reject* based on a NEPA review of estimated GHG impacts (indirect or direct) a certificate application for a facility that otherwise would be found necessary to serve the public under the NGA. Nor would it: As an information-forcing statute, NEPA imposes no substantive obligations. <sup>(56)</sup>

32. Even conducting an analysis of indirect GHG effects under NEPA goes too far. The Supreme Court has explicitly rejected the idea that an “an agency’s action is considered a cause of an environmental effect [under NEPA] even when the agency has no statutory authority to prevent that effect.” <sup>(57)</sup> Rather, NEPA “requires a reasonably close causal relationship between the environmental effect and the alleged cause,” that is analogous to “the familiar doctrine of proximate cause from tort law.” <sup>(58)</sup> While this might leave some difficult judgments at the margins, estimates of the potential global impacts of possible non-jurisdictional upstream or downstream activity—as today’s orders purport to require <sup>(59)</sup> —is not a close call.

33. First off, in determining how far an agency’s NEPA responsibilities run, one “must look to the underlying policies or legislative intent in order to draw a manageable line between those causal changes that may make an actor responsible for an effect and those that do not.” <sup>(60)</sup> As discussed at length above, there is no way of drawing a plausible line, much less a manageable one, from the Commission’s certifying responsibilities under the NGA and the possible consequences of global climate change—consequences which, however potentially grave, are remote from this agency’s limited statutory mission under the NGA.

34. Second, speculating about the possible future impact on global climate change of a facility’s potential GHG emissions does not assist the Commission in its decision-making and therefore violates the “rule of reason”: Where an agency lacks the power to do anything about the possible environmental impacts, it is not obligated to analyze them under NEPA. <sup>(61)</sup> Again, the Supreme Court has explained, “inherent in NEPA and its implementing regulations is a ‘rule of reason,’ which ensures that agencies determine whether and to what extent to prepare an EIS based on the usefulness of any new potential information to the decision-making process. Where the preparation of an EIS would serve ‘no purpose’ in light of NEPA’s regulatory scheme as a whole, no rule of reason worthy of the title would require an agency to prepare an EIS.” <sup>(62)</sup>

35. This conclusion becomes even more obvious when considered alongside the undeniable fact that neither NEPA nor any other statute contains a scintilla of guidance as to which specific metrics are to be used to determine when the Commission can or must reject a project based on a GHG analysis. The Commission today establishes a threshold of 100,000 metric tons of CO<sub>2</sub>e of annual project emissions for purposes of its analysis of natural gas projects under NEPA <sup>(63)</sup> The rationale for establishing this threshold has literally *nothing* to do with the Commission’s NGA obligations, or even with its NEPA obligations. It consists of little more than piggybacking on EPA’s approach to regulating stationary sources. <sup>(64)</sup> Today’s order boasts that this new threshold will capture projects “transporting an average of 5,200 dekatherms per day and projects involving the operation of *one* or more compressor stations or LNG facilities” <sup>(65)</sup> and that this threshold “will capture over 99% of GHG emissions from Commission-regulated natural gas projects.” <sup>(66)</sup>

36. These are just arbitrarily chosen numbers. A proliferation of quantification does not constitute reasoned decision-making. All of the important questions about the creation and application of this threshold remain unanswered: Is there anything in either the NGA or NEPA to indicate how much is too much and should be rejected? Or how little is low enough to get under the red line? No. If the Commission is attempting to quantify *indirect* global GHG impacts, as EPA now suggests we do, <sup>(67)</sup> how much global impact is too much and requires rejection of the certificate? How much impact is *not* too much? Should rejection only be based

on impacts on the United States? North America? The Western Hemisphere? The planet? Where is the line? Again, there is absolutely no statutory provision that answers these questions as to the application of GHG metrics in a certificate proceeding brought under the NGA. The complete absence of any statutory guidance on the seminal question of “how much is too much?” would render any action by the Commission to reject a certificate based on any metric as “arbitrary and capricious” in the fullest sense. <sup>(68)</sup>

37. I recognize that the 100,000 metric tons marker adopted in today's orders is not a threshold for rejecting a proposed project but only for subjecting it to further scrutiny in the form of an EIS. But this is no small matter—completion of an EIS is extremely cost-intensive and time-consuming and, in addition, creates a plethora of opportunities for opponents of the project who otherwise lack meritorious objections to it, to run up the costs, to cause delays, and to create new grounds for the inevitable appeals challenging the certificate even if the applicant does manage to obtain it. <sup>(69)</sup>

38. NEPA provides no statutory authority to reject a gas project that would otherwise be approved under the NGA. How could it? As is well-known, the duties NEPA imposes are essentially procedural and informational. <sup>(70)</sup> The Commission's regulations implementing NEPA reflect its limits by noting that, “[t]he Commission will comply with the regulations of the Council on Environmental Quality *except where those regulations are inconsistent with the statutory requirements of the Commission.*” <sup>(71)</sup>

39. It's not actually very difficult to see how the approach the majority adopts today is “inconsistent with the statutory requirements of the Commission.” <sup>(72)</sup> I will repeat that the purpose of the NGA is to *promote* the development, transportation, and sale at reasonable rates of natural gas. I will repeat that the NGA conveys only *limited* jurisdictional authority; that NEPA conveys *no* jurisdictional authority; that a *different* agency is responsible for regulating GHGs; and that such regulation is a *major issue* that Congress would have to speak to *unambiguously*, which it clearly has *not* done. And yet under the analysis embraced by the majority today, this Commission purports to impose onerous—possibly fatal—regulatory requirements on certificate applicants in order to generate reams of highly speculative data that have no meaningful role to play in the execution of this agency's statutory duties. <sup>(73)</sup> In fact, it contravenes the purposes of the NGA in at least two obvious ways: First, by bringing extrinsic considerations to bear on the Commission's decision-making, and second, by causing needless delay in the process. <sup>(74)</sup>

40. There is no meaningful way of evaluating any of the critical issues, and no statutory authority to actually do anything about upstream or downstream emissions, <sup>(75)</sup> but unlimited ways to find fault with any analysis. Even though they aren't supposed to “flyspeck” an agency's NEPA analysis, judges who wish to impose their own policy preferences will be tempted to do exactly that. And once the agency undertakes to address an issue in its NEPA analysis, it is subject to the APA's “reasoned decision-making” standard of review. <sup>(76)</sup> Thus the effect is to ramp up dramatically the legal uncertainties and costs facing any certificate applicant.

D.

41. Today's orders rely to a remarkable degree on a smattering of statements from a handful of recent orders. Simply put, these authorities are simply “too slender a reed” <sup>(77)</sup> to support the great weight today's orders place on them.

42. Neither *Sabal Trail* <sup>(78)</sup> nor *Birckhead*, <sup>(79)</sup> nor the more recent *Vecinos* <sup>(80)</sup> opinion from the D.C. Circuit changes any of the analysis above. Indeed, to the extent language from those cases is interpreted as requiring the Commission to exercise authority *not* found in statutes—and these opinions are more confusing than clear, as well as inconsistent with the D. C. Circuit's own precedent—then such an interpretation would be contrary to the Supreme Court's major question doctrine. Be that as it may, while I recognize that *Sabal Trail* and *Vecinos* are presently applicable to this Commission, neither of those cases

individually nor both of them together provide a lawful basis for *rejecting* a certificate for a facility that is otherwise found to be needed under the NGA solely because of its estimated potential impacts on global climate change. <sup>(81)</sup>

43. Virtually the entire structure of the majority's fundamental policy changes rests on a single line from *Sabal Trail*. <sup>(82)</sup> That statement is itself predicated on an idiosyncratic reading of *Public Citizen* and the D.C. Circuit's own precedents. <sup>83</sup> *Sabal Trail* rather facilely distinguished existing D.C. Circuit precedent on the grounds that, in contrast to those cases, the same agency that was performing the EIS was also authorized to approve or deny the certificate. <sup>(84)</sup> It reasoned that because the Commission could take "environmental" issues into account in its public interest analysis, and GHG emissions raise "environmental" issues, it must therefore follow that the Commission could deny a certificate based on projected GHG emissions estimates.

44. *Sabal Trail* acknowledged that "*Freeport* and its companion cases rested on the premise that FERC had no legal authority to prevent the adverse environmental effects of natural gas exports." <sup>(85)</sup> Specifically, "FERC was forbidden to rely on the effects of gas exports as a justification for denying an upgrade license." <sup>(86)</sup> In contrast with those cases—all of which addressed certification of LNG facilities under NGA section 3 as opposed to interstate transportation facilities under NGA section 7—the court in *Sabal Trail* concluded that, under NGA section 7, by contrast, "FERC is not so limited. Congress broadly instructed the agency to consider 'the public convenience and necessity' when evaluating applications to construct and operate interstate pipelines." <sup>(87)</sup> It thus concluded that, "[b]ecause FERC could deny a pipeline certificate on the ground that the pipeline would be too harmful for the environment, the agency is a 'legally relevant cause' of the direct and indirect environmental effects of pipelines that it approves. See *Freeport*, 827 F.3d at 47. *Public Citizen* thus did not excuse FERC from considering these indirect effects." <sup>(88)</sup>

45. But the *Sabal Trail* court never considered with reference to the Commission's statutory authority the proper scope of that public interest analysis or the extent to which "environmental" issues could be considered in that context. It simply assumed the Commission's authority to be unlimited. But as discussed above, Congress drafted the NGA for the purpose of filling a specific gap in regulatory authority. The only way *Sabal Trail* would be correct is if Congress had "clearly authorized" the Commission to evaluate geographically and temporally remote impacts of non-jurisdictional activity in its "public convenience and necessity" determinations. As discussed above, that conclusion is clearly, irredeemably, wrong. <sup>(89)</sup>

46. As for *Vecinos*, there, the court compounds that error both by relying uncritically on *Sabal Trail* and by finding fault with the Commission for failing to connect its decision not to use the Social Cost of Carbon to Petitioners' argument that it was required to do so under 40 CFR 1502.21(c). <sup>(90)</sup> That regulation sets forth an agency's obligations when "information relevant to reasonably foreseeable significant adverse impacts cannot be obtained." <sup>(91)</sup> But global climate change is only a "foreseeable significant adverse impact" of the Commission's action *if* the Commission's authority extends as far as the *Sabal Trail* court said it does. For the reasons set out in this statement, I respectfully disagree. Nor am I alone in my disagreement. <sup>(92)</sup>

47. Finally, as to the contention that the Commission is bound to follow *Sabal Trail* notwithstanding its errors, I would simply point out that intervening Supreme Court precedents—such as *NFIB* <sup>(93)</sup> and *Ala. Ass'n*. <sup>(94)</sup>—have not just significantly weakened, but utterly eviscerated the conceptual underpinnings of *Sabal Trail*'s limitless construction of the Commission's public interest inquiry under the NGA's "public convenience and necessity" analysis. <sup>(95)</sup> It is folly for this Commission to proceed heedless of the Supreme Court's recent rulings that agencies may not use ambiguous or limited grants of statutory authority in unprecedented ways to make policy on major questions that Congress has reserved for itself. But that's exactly what the Commission does today. <sup>(96)</sup>

48. We are indeed bound to follow judicial precedent, but we don't get to "cherry pick" one precedent such as *Sabal Trail* because we like that particular opinion, while ignoring the many other conflicting precedents, especially those more recent rulings from the Supreme Court itself applying the major question doctrine.

These more recent opinions light up *Sabal Trail* as a clear outlier.

## II. The Real Debate Is About Public Policy Not Law

49. Preventing the construction of each and every natural gas project is the overt public-policy goal of many well-funded interest groups working to reduce or eliminate natural gas usage. <sup>(97)</sup> Today's orders, whatever the intent, will have the undeniable effect of advancing that *policy* goal, and we should not deny the obvious. Rather than bringing legal certainty to the Commission's certificate orders, <sup>(98)</sup> today's orders will greatly increase the costs and uncertainty associated with this Commission's own handling of certificate applications. In fact, by purporting to apply today's new policy retroactively on applications that have already been submitted (and in many instances pending for years), today's action is deeply unfair: It judges by an entirely new set of standards applications that were prepared and submitted to meet the old standards and essentially opens all of them to be relitigated. <sup>(99)</sup> The undoubted effect of these orders will be to interpose additional months or years of delay on project applicants and to increase exponentially the vulnerability on appeal of any Commission orders that do approve a project.

50. Recently I said the Commission's new rule on unlimited late interventions in certificate cases was “not a legal standard, but a legal weapon.” <sup>(100)</sup> The new certificate policy approved today is the mother of all legal weapons. There is no question that it will be wielded against each and every natural gas facility both at the Commission and in the inevitable appeals, making the costs of even pursuing a natural gas project insuperable.

51. Let me emphasize that every person or organization pursuing the policy goal of ending the use of natural gas by opposing every natural gas facility has an absolute right under the First Amendment to engage in such advocacy. However, whether to end the use of natural gas by banning the construction of all new natural gas projects is a public policy question of immense importance, one that affects the lives and livelihoods of tens of millions of Americans and their communities, as well as the country's national security. In a democracy, such a huge policy question should *only* be decided by legislators elected by the people, not by unelected judges or administrative agencies. <sup>(101)</sup>

52. This public-policy context is absolutely relevant to these orders because it illustrates that the long-running controversy at this Commission over the use of GHG analyses in natural-gas certificate cases, whether it's a demand to quantify indirect impacts from upstream production and downstream use, <sup>(102)</sup> or a demand to apply an administratively-constructed metric such as the Social Cost of Carbon <sup>(103)</sup>—and then use GHG analyses to *reject* (or mitigate to death, or impose costly delays on) a gas project—has far less to do with the law itself and far more to do with promoting preferred *public policy* goals.

53. EPA admits as much in a remarkably (perhaps unwittingly) revealing passage in a letter to this Commission:

EPA reaffirms the suggestion that the Commission avoid expressing project-level emissions as a percentage of national or State emissions. Conveying the information in this way *inappropriately diminishes* the significance of project-level GHG emissions. Instead, EPA continues to recommend disclosing *the increasing conflict between GHG emissions and national, State, and local GHG reduction policies and goals* . . . <sup>(104)</sup>

54. So according to EPA, this Commission—which is supposed to be *independent* of the current (or any) presidential administration, by the way—should literally manipulate how it presents GHG data in order to avoid “inappropriately” diminishing the impact. As EPA reveals, this is really not about data or any specific GHG metric at all, but is really about pursuing *public policy* goals, especially those of the current presidential administration that runs EPA. <sup>(105)</sup>

55. The EPA's purported guidance to this Commission illustrates that the real debate here is not over the minutiae of one methodology versus another, or whether one methodology is "generally accepted in the scientific community" and another is not, <sup>(106)</sup> or whether one particular esoteric formula is purportedly required by a regulation issued by the CEQ <sup>(107)</sup> and another does not meet the CEQ's directives.

56. The real debate over the use of GHG analyses in certificate proceedings is about public policy, not law, and ultimately comes down to these questions: *Who makes major decisions of public policy in our constitutional system?* Legislators elected by the people or unelected administrative agencies or judges? *Who decides?* <sup>(108)</sup>

### III. Conclusions

57. Based on the analysis above the following legal conclusions can be drawn:

58. *First*, the Commission may not reject a certificate based solely on an estimate of the impacts of GHG emissions, indirect or direct. Nor, on the basis of such GHG estimates, may the Commission attach to a certificate (or coerce through deficiency letters) conditions that represent a *de facto* rejection by rendering the project financially or technically unfeasible.

59. *Second*, the Commission can consider the direct GHG impacts of the specific facility for which a certificate is sought, just as it analyzes other direct environmental impacts of a project, and can attach reasonable and feasible conditions to the certificate designed to reduce or minimize the direct GHG impacts caused by the facility, just as it does with other environmental impacts.

60. *Third*, the conditions the Commission can impose are, like its other powers, limited to the authorities granted to it by Congress and the purposes for which they are given. So, no, the Commission may not impose conditions on a certificate to mitigate upstream or downstream GHG emissions arising from non-jurisdictional activity.

61. These legal conclusions do not mean that responding to climate change is not a compelling policy necessity for the nation. In my view it is, as I stated above. <sup>(109)</sup>

62. However, neither my policy views—nor those of any other member of this Commission—can confer additional legal authority on FERC. <sup>(110)</sup> For in our democracy, it is the *elected* legislators who have the exclusive power to determine the major policies that respond to a global challenge such as climate change. Further, the argument that administrative agencies must enact policies to address major problems whenever Congress is too slow, too polarized, or too prone to unsatisfying compromises, must be utterly rejected. <sup>(111)</sup> That is not how it is supposed to work in a democracy.

63. For if democracy means anything at all, it means that the people have an inherent right to choose the legislators to whom the people grant the power to decide the major questions of public policy that impact how the people live their daily lives. Unelected Federal judges and executive-branch administrators, no matter how enlightened they and other elites may regard themselves to be, do not have the power to decide such questions; they only have the power to carry out the duly-enacted laws of the United States, including the most important law of all, the Constitution. That is the basic constitutional framework of the United States and it is the same for any liberal democracy worth the name.

For these reasons, I respectfully dissent.

Mark C. Christie,

*Commissioner.*

(173) See, e.g., *Minisink Residents for Env'tl. Pres. & Safety v. FERC*, 762 F.3d 97, 110 n.10 (D.C. Cir. 2014) (noting that the 1999 Policy Statement “permits” but does not “require[ ]” the Commission to “look[ ] beyond the market need reflected by the applicant's existing contracts with shippers”). But see *Environmental Defense Fund v. FERC*, 2 F.4th 953, 973 (D.C. Cir. 2021) (finding that it was arbitrary and capricious for the Commission to rely solely on a single precedent agreement with an affiliate shipper to establish need when demand for natural gas in the area was flat and the Commission neglected to make a finding as to whether the proposed pipeline would result in a more economical alternative to existing pipelines).

(174) Under the Administrative Procedure Act, an agency cannot ignore substantial evidence bearing on the agency decision. See 5 U.S.C. 706; see also, e.g., *Motor Vehicles Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) (holding that an agency decision is arbitrary and capricious if it “entirely fail[s] to consider an important aspect of the problem”).

(175) 1999 Policy Statement, 88 FERC at 61,739-40 (noting that the “use of contracts with affiliates to demonstrate market support for projects has generated opposition from affected landowners and competitor pipelines who question whether the contracts represent real market demand”) and 61,744 (stating that “[u]sing contracts as the primary indicator of market support for the proposed pipeline project also raises additional issues when the contracts are held by pipeline affiliates.”).

(176) 2 F.4th at 973.

(177) See *supra* P 55.

(185) See *Ruby Pipeline, L.L.C.*, 128 FERC ¶ 61,224, at PP 37-39 (2009); see also 1999 Policy Statement, 88 FERC at 61,748.

(186) *City of Clarksville, Tennessee v. FERC*, 888 F.3d at 479 (quoting *NAACP v. FPC*, 425 U.S. at 669-70 and *FPC v. Hope Nat. Gas Co.*, 320 U.S. at 610).

(187) 1999 Policy Statement, 88 FERC at 61,747.

(188) See *Atl. Ref. Co. v. Pub. Serv. Comm'n of N.Y.*, 360 U.S. at 391 (holding that the NGA requires the Commission to consider “all factors being on the public interest”); see also *Sabal Trail*, 867 F.3d at 1373 (explaining that the Commission must consider a pipeline's direct and indirect GHG emissions because the Commission may “deny a pipeline certificate on the ground that the pipeline would be too harmful to the environment”).

(189) Recognizing that CEQ is in the process of revising its NEPA regulations, the Commission will consider the comments in this docket regarding NEPA in our future review of our regulations, procedures, and practices for implementing NEPA.

(190) 15 U.S.C. 717f(e); *see also, e.g., ANR Pipeline Co. v. FERC*, 876 F.2d 124, 129 (D.C. Cir. 1989) (noting the Commission's "extremely broad" conditioning authority).

(191) *Supra* P 15.

(192) *Sabal Trail*, 867 F.3d at 1374.

(193) *Id.* at 1373. In *Birckhead v. FERC*, 925 F.3d 510, 518 (D.C. Cir. 2019), the D.C. Circuit rejected the Commission's position that *Sabal Trail* is limited to the narrow facts of that case. While the court in *Birckhead* acknowledged that downstream emissions may not always be a foreseeable effect of natural gas projects, it rejected the notion that downstream GHG emissions are a reasonably foreseeable indirect effect of a natural gas project only if a specific end destination is identified. The court further noted that the Commission should attempt to obtain information on downstream uses to determine whether downstream GHG emissions are a reasonably foreseeable effect of the project. *Birckhead*, 925 F.3d at 518-19.

(202) *PennEast Pipeline Co., LLC*, 174 FERC ¶¶ 61,056, at P 10 (2021) (citing *Atl. Coast Pipeline, LLC*, 164 FERC ¶¶ 61,100, at P 88 (2018); *Mountain Valley Pipeline, LLC*, 163 FERC ¶¶ 61,197, at P 76 (2018); *PennEast Pipeline Co., LLC*, 164 FERC ¶¶ 61,098, at P 33 n.82 (2018)).

(203) *Limiting Authorizations to Proceed with Construction Activities Pending Rehearing*, Order 871-B, 86 FR 26150 (May 13, 2021), 175 FERC ¶¶ 61,098, *order on reh'g*, Order 871-C, 86 FR 43077 (Aug. 6, 2021), 176 FERC ¶¶ 61,062 (2021).

(204) We recognize that the Commission's environmental justice analysis will also apply to the Commission's authorization of liquefied natural gas facilities, pursuant to section 3 of the NGA. While those authorizations are not the subject of this Updated Policy Statement, this commitment is worth noting in this discussion of impacts on environmental justice communities.

(205) Policy Integrity 2021 Comments at 46-47, 55-56.

(206) *Vecinos para el Bienestar de la Comunidad Costera v. FERC*, 6 F.4th 1321 (D.C. Cir. 2021) ( *Vecinos* ) (remanding a Commission order based in part on a "deficient" environmental justice analysis).

(207) For example, screening tool data "may need to be supplemented with additional or more localized information and/or ground truthing." EPA 2021 Comments at 7, 9.

(208) This may include, for example, relevant State or local agencies. We also note that Federal agencies, including EPA and CEQ, are in the process of updating their guidance regarding environmental justice.

(209) North Carolina DEQ 2018 Comments at 8. See *also* Niskanen Center 2018 Comments at 17-19.

(210) An overly broad geographic unit of analysis, for example, could dilute the presence of environmental justice communities. See Policy Integrity 2021 Comments at 46-48; see *also* Federal Interagency Working Group on Environmental Justice & NEPA Committee, *Promising Practices for EJ Methodologies in NEPA Reviews* at 21, 26 (March 2016), [https://www.epa.gov/sites/production/files/2016-08/documents/nepa\\_promising\\_practices\\_document\\_2016.pdf](https://www.epa.gov/sites/production/files/2016-08/documents/nepa_promising_practices_document_2016.pdf) (EJ IWG & NEPA Committee).

(211) See *Vecinos*, 6 F.4th at 1330 (“When conducting an environmental justice analysis, an agency’s delineation of the area potentially affected by the project must be ‘reasonable and adequately explained,’ . . . and include ‘a rational connection between the facts found and the decision made.’” (citations omitted)).

(212) See EJ IWG & NEPA Committee at 21-28.

(213) “‘Cumulative impact’ is the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.” 40 CFR 1508.7 (1978).

(221) *Id.*

(222) 44 U.S.C. 3507(d).

(223) 5 CFR 1320.

(224) This Updated Policy Statement does not require the collection of any information, but rather discusses information that entities may elect to provide. The Commission is following Paperwork Reduction Act procedures to ensure compliance with that act.

(225) The Updated Policy Statement will not impact burden estimates to the following components of FERC-537: Pipeline Purging/Testing Exemptions, Blanket Certificates Prior Notice Filings, Blanket Certificates-Annual Reports, Section 311 Construction-Annual Reports, Request for Waiver of Capacity Release Regulations, Interstate and Intrastate Bypass Notice, Blanket Certificates, or Hinshaw Blanket Certificates.

(226) Burden is defined as the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. See 5 CFR 1320 for additional information on the definition of information collection burden.

(227) Commission staff estimates that the industry’s average hourly cost for this information collection is approximated by the Commission’s average hourly cost (for wages and benefits) for 2021, or \$87.00/hour.

(24) See *FPC v. Transcon. Gas Pipe Line Corp.*, 365 U.S. 1, 8 (1961) (*Transco*) (“Congress, in enacting the Natural Gas Act, did not give the Commission comprehensive powers over every incident of gas production, transportation, and sale. Rather, Congress was ‘meticulous’ only to invest the Commission with authority over certain aspects of this field leaving the residue for State regulation.”) (citation omitted); see also *FPC v. Panhandle E. Pipe Line Co.* 337 U.S. 498, 502-03 (1949) (“[S]uffice it to say that the Natural Gas Act did not envisage federal regulation of the entire natural-gas field to the limit of constitutional power. Rather it contemplated the exercise of federal power as specified in the Act, particularly in that interstate segment which the states were powerless to regulate because of the Commerce Clause of the Federal Constitution.”) (footnote omitted).

(25) See *Nat. Res. Def. Council, Inc. v. EPA*, 822 F.2d 104, 129 (D.C. Cir. 1987) (“NEPA, as a procedural device, does not work a broadening of the agency’s substantive powers.”) (citations omitted); *Cape May Greene, Inc. v. Warren*, 698 F.2d 179, 188 (3d Cir. 1983) (“The National Environmental Policy Act does not expand the jurisdiction of an agency beyond that set forth in its organic statute.”) (citations omitted); *Gage v. U.S. Atomic Energy Comm’n*, 479 F.2d 1214, 1220 n.19 (D.C. Cir. 1973) (“NEPA does not mandate action which goes beyond the agency’s organic jurisdiction.”) (citation omitted).

(26) *Marsh v. Or. Nat. Res. Council*, 490 U.S. 360, 371 (1989); accord *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 350 (1989) (*Methow Valley*) (“[I]t is now well settled that NEPA itself does not mandate particular results, but simply prescribes the necessary process.”); see also *Baltimore Gas & Elec. Co. v. Nat. Res. Def. Council, Inc.*, 462 U.S. 87, 97 (1983) (“Congress in enacting NEPA . . . did not require agencies to elevate environmental concerns over other appropriate considerations.”).

(27) *Dep’t of Transp. v. Pub. Citizen*, 541 U.S. 752, 756-57 (2004) (citation omitted); accord *Winter v. Nat. Res. Def. Council, Inc.*, 555 U.S. 7, 23 (2008) (“NEPA imposes only procedural requirements to ‘ensur[e] that the agency, in reaching its decision, will have available, and will carefully consider, detailed information concerning significant environmental impacts.’”) (quoting *Methow Valley*, 490 U.S. at 349); see also *Vt. Yankee Nuclear Power Corp. v. Nat. Res. Def. Council, Inc.*, 435 U.S. 519, 558 (1978) (“NEPA does set forth significant substantive goals for the Nation, but its mandate to the agencies is essentially procedural.”) (citations omitted).

(28) *Citizens Against Burlington, Inc. v. Busey*, 938 F.2d 190, 206 (D.C. Cir. 1991) (citing *Methow Valley*, 490 U.S. at 353 & n.16).

(29) See Updated Policy Statement, 178 FERC ¶61,107 at P 74 (“We will consider environmental impacts and potential mitigation in both our environmental reviews under NEPA and our public interest determinations under the NGA. The Commission expects applicants to structure their projects to avoid, or minimize, potential adverse environmental impacts.”); *id.* (“Should we deem an applicant’s proposed mitigation of impacts inadequate to enable us to reach a public interest determination, we may condition the

certificate to require additional mitigation.”); *id.* P 79 (“[W]e clarify that our consideration of impacts to communities surrounding a proposed project will include an assessment of impacts to any environmental justice communities and of necessary mitigation to avoid or lessen those impacts.”).

(30) *But see id.* P 74 (concluding because the Commission's conditioning authority is broad, if the Commission determines that the applicant's proposed mitigation of impacts are inadequate, the Commission has the authority to condition the certificate to require additional mitigation).

(31) 15 U.S.C. 717f(e).

(32) *See Richmond Power & Light of City of Richmond, Ind. v. FERC*, 574 F.2d 610, 620 (D.C. Cir. 1978) (“What the Commission is prohibited from doing directly it may not achieve by indirection.”) (footnote omitted).

(33) *See Methow Valley*, 490 U.S. at 352-53 (“There is a fundamental distinction, however, between a requirement that mitigation be discussed in sufficient detail to ensure that environmental consequences have been fairly evaluated, on the one hand, and a substantive requirement that a complete mitigation plan be actually formulated and adopted, on the other. . . . Even more significantly, it would be inconsistent with NEPA's reliance on procedural mechanisms—as opposed to substantive, result-based standards—to demand the presence of a fully developed plan that will mitigate environmental harm before an agency can act.”) (citing *Baltimore Gas & Elec. Co.*, 462 U.S. at 100 (“NEPA does not require agencies to adopt any particular internal decisionmaking structure”)).

(34) Original Policy Statement, 88 FERC ¶ 61,227 at 61,747.

(35) *NEXUS Gas Transmission, LLC*, 172 FERC ¶ 61,199, at P 5 (2020) (citation omitted).

(36) Updated Policy Statement, 178 FERC ¶ 61,107 at P 52 (emphasis added).

(37) *See id.* P 54 (citing *Minisink Residents for Env'tl. Pres. & Safety v. FERC*, 762 F.3d 97, 110 n.10 (D.C. Cir. 2014) (noting that the 1999 Policy Statement “permits” but does not “require[ ]” the Commission to “look[ ] beyond the market need reflected by the applicant's existing contracts with shippers”)).

(38) *Id.*

(39) *Id.* P 54 (listing other considerations that it views as relevant to a need determination, including whether the agreements were entered into before or after an open season, the results of the open season, the number of bidders, whether the agreements were entered into in response to a local distribution company or generator request for proposals (RFP), the details of any such RFP process, demand projections underlying the capacity subscribed, estimated capacity utilization rates, potential cost savings to customers, regional assessments, and filings or statements from State regulatory commissions or local distribution companies regarding the proposed project).

(40) *Id.* P 55.

(41) *Id.*

(42) *See id.*

(43) *Id.*

(44) *See id.* PP 55-59.

(45) *Id.* P 60.

(46) *Id.* P 54. I am generally skeptical of affiliate transactions and think that in most circumstances, the Commission should scrutinize agreements with an affiliate. As I have previously explained, I agree with the U.S. Court of Appeals for District of Columbia Circuit's decision to remand the Commission's orders and the court's explanation for doing so in *Environmental Defense Fund v. FERC*, 2 F.4th 953. See *Spire STL Pipeline LLC*, 176 FERC ¶ 61,160 (2021) (Danly, Comm'r, dissenting at P 9).

(47) See, e.g., *City of Oberlin, Ohio v. FERC*, 937 F.3d 599, 606 (D.C. Cir. 2019) (“[T]his Court has also recognized that ‘it is Commission policy to not look behind precedent or service agreements to make judgments about the needs of individual shippers.’”) (citation omitted); *Minisink Residents for Env'tl. Pres. & Safety v. FERC*, 762 F.3d at 111 (“Petitioners identify nothing in the policy statement or in any precedent construing it to suggest that it requires, rather than permits, the Commission to assess a project's benefits by looking beyond the market need reflected by the applicant's existing contracts with shippers. To the contrary, the policy statement specifically recognizes that such agreements ‘always will be important evidence of demand for a project.’”) (quoting Original Policy Statement, 88 FERC ¶ 61,227 at 61,748); see also *Myersville Citizens for a Rural Cmty., Inc. v. FERC*, 783 F.3d 1301, 1311 (D.C. Cir. 2015) (explaining that “[f]or a variety of reasons related to the nature of the market, ‘it is Commission policy to not look behind precedent or service agreements to make judgments about the needs of individual shippers.’ . . . In keeping with its policy, the Commission concluded that the evidence that the Project was fully subscribed was adequate to support the finding of market need.”) (citation omitted).

(48) *Env'tl. Def. Fund v. FERC*, 2 F.4th 953.

(49) *Id.* at 976.

(50) Enbridge Gas Pipelines May 26, 2021 Comments at 42. “[U]nder the Commission's open-access regulatory regime, pipelines must provide transportation service without ‘undue discrimination or preference of any kind.’” *NEXUS Gas Transmission, LLC*, 172 FERC ¶ 61,199, at P 17 (2020) (quoting 18 CFR 284.7(b)). The Commission's new consideration of the intended end use of the gas and why the gas is needed to serve that use may also cause tension with NGA section 4. Updated Policy Statement, 178 FERC ¶ 61,107 at P 52. NGA section 4(b) states that “[n]o natural-gas company shall, with respect to any transportation or sale of natural gas subject to the jurisdiction of the Commission, (1) make or grant any undue preference or advantage to any person or subject any person to any undue prejudice or disadvantage, or (2) maintain any unreasonable difference in rates, charges, service, facilities, or in any other respect, either as between localities or as between classes of service.” 15 U.S.C. 717c(b).

(51) *Transco*, 365 U.S. at 22.

(52) See, e.g., TC Energy Corporation May 26, 2021 Comments at 12-13 (explaining that after the Supreme Court's *Transco* decision “was issued in 1961, Congress passed the NGPA, the Wellhead Decontrol Act, EPA Act 1992, and the Commission issued Orders Nos. 636 and 637. These statutes and regulatory orders fundamentally altered the natural gas markets by acting to facilitate the development of competitive natural gas markets served by competitive interstate natural gas transportation.”); *id.* (“Under the current regulatory framework, there is no basis for the Commission to deny a certificate application based on end use, because the current framework requires equal access to a plentiful gas supply for all buyers and sellers. The end use of natural gas is outside the objectives of the current statutory framework, and the Commission should not take end use into consideration when assessing the public need for a pipeline project under the NGA.”); Boardwalk Pipeline Partners, LP May 26, 2021 Comments at 34 (“*FPC v. Transco* was decided prior to the NGPA's and Wellhead Decontrol Act's creation of a competitive natural gas market that allows all consumers to benefit from the United States' plentiful gas supplies . . . . [G]iven all of the changes that have occurred over the past 60 years” and “[u]nder the current open-access regime, there is no legal basis for the Commission to deny a certificate application based on end use.”) (emphasis omitted).

- (96) Updated Policy Statement, 178 FERC ¶¶ 61,107 P 90 (relying on a repealed definition for "cumulative impacts," formerly 40 CFR 1508.7 (1978), in the Council on Environmental Quality's (CEQ) regulations) (citations omitted).
- (97) *Id.* P 90 n.213.
- (98) *Cf.* Updated Policy Statement, 178 FERC ¶¶ 61,107 at P 74 n.189 ("Recognizing that CEQ is in the process of revising its NEPA regulations, the Commission will consider the comments in this docket regarding NEPA in our future review of our regulations, procedures, and practices for implementing NEPA.)
- (99) See 40 CFR 1508.1(g)(3) ("An agency's analysis of effects shall be consistent with this paragraph (g). Cumulative impact, defined in 40 CFR [§ ] 1508.7 (1978), is repealed.").
- (100) Updated Policy Statement, 178 FERC ¶¶ 61,107 at P 90.
- (101) See 40 CFR 1508.1(g) (defining "effects or impacts").
- (102) 18 CFR 380.1.
- (103) See Updated Policy Statement, 178 FERC ¶¶ 61,107 at P 53 (stating that "the Commission's expectations and requirements for how applicants should demonstrate project need have evolved over time").
- (104) See, e.g., *id.* P 74 ("Should we deem an applicant's proposed mitigation of impacts inadequate to enable us to reach a public interest determination, we may condition the certificate to require additional mitigation. We may also deny an application based on any of the types of adverse impacts described herein, including environmental impacts, if the adverse impacts as a whole outweigh the benefits of the project and cannot be mitigated or minimized."); *id.* P 82 ("[W]e expect pipelines to take seriously their obligation to attempt to negotiate easements respectfully and in good faith with impacted landowners. The Commission will look unfavorably on applicants that do not work proactively with landowners to address concerns.").
- (105) Lewis Carroll, *Alice's Adventures in Wonderland and Through the Looking-Glass* 107 (Hugh Haughton ed., Penguin Classics 1998).
- (106) See 15 U.S.C. 717f(e) ("The Commission shall have the power to attach to the issuance of the certificate and to the exercise of the rights granted thereunder such *reasonable terms and conditions* as the public convenience and necessity may require.") (emphasis added).
- (107) Updated Policy Statement, 178 FERC ¶¶ 61,107 at P 3 (stating that the Updated Policy Statement does not establish binding rules, but rather it is intended to explain how the Commission will consider NGA section 7 certificate applications).
- (108) See *Interstate Nat. Gas Ass'n of Am. v. FERC*, 285 F.3d 18, 59 (D.C. Cir. 2002) ("The distinction between substantive rule and policy statement is said to turn largely on whether the agency position is one of 'present binding effect,' i.e., whether it 'constrains the agency's discretion.'") (citations omitted); *Brown Express, Inc. v. United States*, 607 F.2d 695, 701 (5th Cir. 1979) ("An announcement stating a change in the method by which an agency will grant substantive rights is not a 'general statement of policy.'").
- (109) See *Panhandle E. Pipe Line Co. v. FERC*, 198 F.3d 266, 270 (D.C. Cir. 1999) (denying the petition for review because "[t]he challenged opinions [were] non-binding policy statements" and therefore, the court found that the party petitioning for review was "not aggrieved and has not suffered an injury-in-fact").

(110) See Updated Policy Statement, 178 FERC ¶ 61,107 at P 100 (“[T]he Commission will apply the Updated Policy Statement to any currently pending applications for new certificates. Applicants will be given the opportunity to supplement the record and explain how their proposals are consistent with this Updated Policy Statement, and stakeholders will have an opportunity to respond to any such filings.”).

(111) “ ‘Natural-gas company’ means a person engaged in the transportation of natural gas in interstate commerce, or the sale in interstate commerce of such gas for resale.” 15 U.S.C. 717a(6).

(112) See Updated Policy Statement, 178 FERC ¶ 61,107 at P 100.

(113) See 18 CFR 157.6(b) (“Each application filed other than an application for permission and approval to abandon pursuant to section 7(b) shall set forth the following information . . .”).

(114) *Id.* § 157.5(a).

(115) *Cf. MCI Telecomms. Corp. v. Am. Tel. & Tel. Co.*, 512 U.S. 218, 228 (1994) (“It might be good English to say that the French Revolution ‘modified’ the status of the French nobility—but only because there is a figure of speech called understatement and a literary device known as sarcasm.”).

(116) *NAACP*, 425 U.S. at 669-70 (citations omitted); *accord Myersville*, 783 F.3d at 1307 (quoting *NAACP*, 425 U.S. at 669-70).

(117) NERC, Long Term Reliability Assessment, at 5 (Dec. 2021), [https://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC\\_LTRA\\_2021.pdf](https://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC_LTRA_2021.pdf) (emphasis added).

(118) See Updated Policy Statement, 178 FERC ¶ 61,107 at P 51 (asserting that the Commission is “providing more regulatory certainty in the Commission’s review process and public interest determinations”); *id.* P 73 (“To provide more clarity and regulatory certainty to all participants in certificate proceedings, we explain here how the Commission will consider environmental impacts.”); *id.* P 100 (“A major purpose of this Updated Policy Statement is to provide clarity and regulatory certainty regarding the Commission’s decision-making process.”).

(1) *Certification of New Interstate Natural Gas Facilities*, 174 FERC ¶ 61,125 (2021).

(2) I also voted for the 2021 changes to the procedures for imposing a stay on the certificate and use of eminent domain during periods when petitions for reconsideration and appeals were pending. *Limiting Authorizations to Proceed with Construction Activities Pending Rehearing*, Order No. 871-B, 175 FERC ¶ 61,098 (2021). These changes were largely opposed by the pipeline industry, but in my opinion represented a reasonable approach to bring more certainty and fairness to our procedures for handling petitions for reconsideration and the use of eminent domain during the pending period.

(3) See *Certification of New Interstate Natural Gas Facilities*, 178 FERC ¶ 61,107 (2022) (Certificate Policy Statement) at PP 53-57. The need for enhanced scrutiny of contracts among corporate affiliates is recognized in State utility regulation. See, e.g., Va. Code § 56-76 *et seq.*, known as the “Virginia Affiliates Act.”

(4) See *Joint Anti-Fascist Refugee Comm. v. McGrath*, 341 U.S. 123 (1951) (Frankfurter, J., concurring).

(5) *Certificate Policy Statement; Consideration of Greenhouse Gas Emissions in Natural Gas* 178 FERC ¶ 61,108 (2022) (GHG Policy Statement). Although styled as an “interim” policy statement, it goes into effect immediately and will inflict major new costs and uncertainties on certificate applications that have been pending with the Commission for months or years. *Id.* at PP 1, 130. I consider both policy statements to be indivisible parts of a new policy governing certificates. Thus, my statement applies to both, and I am entering this dissent in both dockets.

(10) See *NERC December 2021 Long-Term Reliability Assessment*, at 5 (Dec. 2021) (“Natural gas is the reliability ‘fuel that keeps the lights on,’ and *natural gas policy must reflect this reality.*”) (emphasis added) (available at [https://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC\\_LTRA\\_2021.pdf](https://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC_LTRA_2021.pdf)); *id.* at 6 (“Sufficient flexible [dispatchable] resources are needed to support increasing levels of variable [intermittent] generation *uncertainty*. Until storage technology is fully developed and deployed at scale, (which cannot be presumed to occur within the time horizon of this LTRA), natural gas-fired generation will remain a necessary balancing resource to provide increasing flexibility needs.”) (emphasis added); *NERC 2020 Long-Term Reliability Assessment, December 2020*, at 7 (Dec. 2020) (“As *more solar and wind* generation is added, *additional* flexible resources are needed to offset their resources' variability. This is placing *more* operating pressure on those ( *typically natural gas* ) resources and makes them *the key* to securing [Bulk Power System] reliability.”) (emphases added) (available at [https://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC\\_LTRA\\_2020.pdf](https://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC_LTRA_2020.pdf)).

(11) Letter from Industrial Energy Consumers of America to Sen. Joe Manchin III, Sen. John Barrasso, Sen. Frank Pallone, Jr., Sen. Cathy McMorris Rodgers, *Lack of Interstate Natural Gas Pipeline Capacity Threatens Manufacturing Operations, Investments, Jobs, and Supply Chain* (Feb. 9, 2022).

(12) Since we are regulators with an advisory role, not Article III judges, my personal view is that the most politically realistic and sustainable way to reduce carbon emissions significantly without threatening the reliability of our grid and punishing tens of millions of American workers and consumers with lost jobs and skyrocketing energy prices ( see, e.g., Europe) is by massive *public* investment in the research, development and deployment of the technologies that can achieve that goal economically and effectively. See, e.g., Press Release, Bipartisan Policy Center, *New AEIC Report Recommends DOE Combine Loan and Demonstration Offices, Jumpstart American Clean Energy Deployment* (Jan. 21, 2022), available at <https://bipartisanpolicy.org/press-release/new-aeic-report-recommends-doe-combine-loan-and-demonstration-offices-jumpstart-american-clean-energy-deployment/> (citing to American Energy Innovation Council, *Scaling Innovation: A Proposed Framework for Scaling Energy Demonstrations and Early Deployment* (Jan. 2022)). Once developed to commercial scale, marketable technologies will roll out globally on their own, without the market-distorting mandates and subsidies that only enrich rent-seekers and impoverish consumers. More specifically with regard to natural gas facilities, there is also the potential with available technology to reduce direct methane emissions from the existing oil and gas system within existing legal authority. And such initiatives do not obviate the need for near-term mitigation measures, such as preparing the electric grid to maintain power during extreme weather events.

- (19) Certificate Policy Statement at P 62.
- (20) *Id.*
- (21) *Id.* The notion that a certificate could be rejected based solely on the interests of “landowners” or “environmental justice communities” (a term the majority leaves largely undefined) illustrates the radical divergence from both law and long Commission practice of what the Commission purports to do today. While a regulatory commission should always be mindful of and sensitive to the impacts on affected property owners and communities in every case involving the potential use of eminent domain—particularly on the question of the project’s route or siting—and should generally seek wherever possible to reduce or minimize such impacts, specific measures to reduce or minimize such impacts are governed by the statutes applicable to each proceeding. Under both the Constitution and the NGA, if a project is needed for a public purpose, then landowners are made whole through just compensation. U.S. Const. amend. V. Questions of compensation are adjudicated in State or Federal court—not by this Commission. NGA section 7(h), 15 U.S.C. 717f(h). Bringing such extra-jurisdictional considerations into the Commission’s public convenience and necessity analyses under NGA section 7 is just another expansion of Commission power far beyond anything justified in law.
- (22) *Sabal Trail*, 867 F.3d 1357, 1382 (D.C. Cir. 2017) ( *Sabal Trail* ) (Brown, J., dissenting in part and concurring in part).
- (23) *Atl. Refining Co. v. Pub. Serv. Comm’n of State of N. Y.*, 360 U.S. 378, 391 (1959) (“This is not to say that rates are the only factor bearing on the public convenience and necessity, for § 7(e) requires the Commission to evaluate all factors bearing on the public interest.”); *N.C. Gas Corp.*, 10 FPC 469, 476 (1950) (“Public convenience and necessity comprehends a question of the public interest. Or, stated another way: Is the proposal conducive to the public welfare? Is it reasonably required to promote the accommodation of the public? The public interest we referred to has many facets. *To the limit of our authority under the law* our responsibility encompasses them all”) (emphasis added) (quoting *Commonwealth Nat. Gas Corp.*, 9 FPC 70 (1950)).
- (24) *NAACP v. FPC*, 425 U.S. 662, 669 (1976) (“This Court’s cases have consistently held that the use of the words ‘public interest’ in a regulatory statute is not a broad license to promote the general public welfare. Rather, the words take meaning from the purposes of the regulatory legislation.”). Where the Supreme Court has permitted the Commission to consider end use, those considerations have related directly to its core statutory responsibilities under the NGA, namely, ensuring adequate supply at reasonable rates. See *FPC v. Transcontinental Pipe Line Co.*, 365 U.S. 1 (1961) (permitting the Commission to consider whether the end use was “wasteful” of limited gas resources).
- (25) NGA section 1(b), 15 U.S.C. 717(b).
- (26) *ONEOK, Inc. v. Learjet, Inc.*, 575 U.S. 373, 378 (2015) (emphasis added); see also, *FPC v. Panhandle E. Pipe Line Co.*, 337 U.S. 498, 502-503 (1949) (“suffice it to say that the Natural Gas Act did not envisage federal regulation of the entire natural-gas field to the limit of constitutional power. Rather it contemplated the exercise of federal power as specified in the Act, particularly in that interstate segment which states were powerless to regulate because of the Commerce Clause of the Federal Constitution. The jurisdiction

of the Federal Power Commission was to *complement* that of the state regulatory bodies.”) (emphasis added) (footnotes omitted); *Myersville Citizens for a Rural Cmty., Inc. v. FERC*, 783 F.3d 1301, 1315 (D.C. Cir. 2015) (“the Commission’s power to preempt state and local law is circumscribed by the Natural Gas Act’s savings clause, which saves from preemption the ‘rights of States’ under the Clean Air Act and two other statutes.”) (citations omitted).

(27) *Ofc. of Consumers’ Counsel v. FERC*, 655 F.2d 1132, 1142 (D.C. Cir. 1980) (“We bear in mind the caveat that an agency may not bootstrap itself into an area in which it has no jurisdiction by violating its statutory mandate.”) (citations, quotation marks, ellipsis omitted).

(28) *City of Clarksville, Tenn. v. FERC*, 888 F.3d 477, 479 (D.C. Cir. 2018) ( *City of Clarksville* ) (“Congress enacted the Natural Gas Act with the principal aim of ‘encouraging the orderly development of plentiful supplies of natural gas at reasonable prices,’ and ‘protect[ing] consumers against exploitation at the hands of natural gas companies,”) (citations omitted); see also Alexandra B. Klass & Danielle Meinhardt, *Transporting Oil and Gas: U.S. Infrastructure Challenges*, 100 *Iowa L. Rev.* 947, 990-99 (Mar. 2015).

(29) *City of Clarksville*, 888 F.3d. at 479. (“Along with those main objectives, there are also several ‘subsidiary purposes including conservation, environmental, and antitrust issues.’”) (quoting *Pub. Utils. Comm’n of Cal. v. FERC*, 900 F.2d 269, 281 (D.C. Cir. 1990)) (cleaned up). This does not mean that the Commission cannot properly impose conditions or mitigation to address environmental impacts *directly* related to the jurisdictional project; it merely recognizes that the Commission’s main objective is to facilitate the expansion and preservation of natural gas service at just and reasonable rates and that doing so will inevitably entail some measure of environmental costs. These can sometimes be reduced or minimized, but never completely eliminated. Every project ever built has some degree of environmental impacts. The standard under the NGA cannot be zero impacts.

(30) Congress could easily have conferred that authority if it had wanted to. There is no indication that Congress intended or expected FERC to perform any environmental regulation when it created the agency. See generally, Clark Bye, *The Department of Energy Organization Act: Structure and Procedure*, 30 *Admin. L. Rev.* 193 (1978). This Commission’s predecessor, the Federal Power Commission, existed for decades before EPA was created in 1970. And Congress began enacting legislation bearing on emissions decades before then as well. See Christopher D. Ahlers, *Origins of the Clean Air Act: A New Interpretation*, 45 *Env’tl. L.* 75 (2015). Nor were the effects of GHG emissions unknown at that time. See Danny Lewis, *Scientists Have Been Talking About Greenhouse Gases for 191 Years*, *Smithsonian Magazine* (Aug. 3, 2015) (citing to Nobel Laureate Svante Arrhenius’ 1896 paper “On the Influence of Carbonic Acid in the Air upon the Temperature of the Ground”).

(31) See *United States v. Pub. Utils. Comm’n of Cal.*, 345 U.S. 295, 315 (1953) (explaining that recourse to legislative history is appropriate where “the literal words would bring about an end completely at variance with the purpose of the statute.”) (citations omitted). The present circumstance is very nearly the opposite: We are urged to pursue “an end completely at variance with the purpose of the statute” and for which there is *no* support in the “literal words.” *Id.*; see also *Ctr. for Biological Diversity v. U.S. Army Corps of Eng’rs*, 941 F.3d 1288, 1299 (11th Cir. 2019) ( *Ctr. for Biological Diversity* ) (“Regulations cannot contradict their animating statutes or manufacture additional agency power.”) (citing *Brown & Williamson*, 529 U.S. at 125-26).

(32) *NAACP v. FPC*, 425 U.S. at 665-670 (noting that, although “the eradication of discrimination in our society is an important national goal,” the Supreme Court has “consistently held that the use of the words ‘public interest’ in a regulatory statute is not a broad license to promote the general welfare. Rather, the words take meaning from the purposes of the regulatory legislation” which, for the [Federal Power Act] and [Natural Gas Act], are “to encourage the orderly development of plentiful supplies of electricity and natural gas at reasonable prices.”); see also *Brown & Williamson*, 529 U.S. at 161 (“no matter how important,

conspicuous, and controversial the issue, and regardless of how likely the public is to hold the Executive Branch politically accountable, . . . an administrative agency's power to regulate in the public interest must always be grounded in a valid grant of authority from Congress.”) (quotation marks, citation omitted).

(33) *Office of Consumers' Counsel v. FERC*, 655 F.2d at 1147 (emphases added).

(34) See, e.g., NGA section 7(e), 15 U.S.C. 717f(e) (apart from statutory exceptions, “a certificate *shall* be issued to any qualified applicant . . . if it is found that the applicant is able and willing properly to do the acts and to perform the service proposed,” and, among other things, to comply with “the requirements, rules and regulations of the Commission . . .”) (emphasis added).

(35) Certificate Policy Statement at PP 4-6; GHG Policy Statement at P 39 (citing *Sabal Trail*, 867 F.3d at 1372-73).

(36) I won't belabor the point, but just to reiterate: A “public convenience and necessity” analysis is not a generalized “public interest” analysis, as courts have recognized. See, *supra*, P 13 & n.24 and *infra*, P 27. The “environmental” impacts appropriately considered in a certification proceeding must surely be limited in some way to the proposed facility itself since both upstream gathering and downstream use are beyond the Commission's statutory jurisdiction. See *City of Clarksville*, 888 F.3d at 479 (identifying “environmental” concerns as a “subsidiary” purpose of the NGA).

(37) *Jacobellis v. Ohio*, 378 U.S. 184, 197 (1964) (Stewart, J., concurring); see also Catherine Morehouse, *Glick, Danly spar over gas pipeline reviews as FERC considers project's climate impacts for first time, Utility Dive* (Mar. 19, 2021) (quoting Chairman Glick regarding use of GHG emissions analysis in *N. Natural Gas Co.*, 174 FERC ¶ 61,189 (2021): “We essentially used the eyeball test. . .”). Shorn of its irrelevant disquisition on EPA's stationary source regulations, today's GHG policy statement enshrines an eyeball test as the trigger for subjecting virtually all certificate applicants to the time-consuming and costly EIS process. GHG Statement at PP 88-95.

(38) *Miller v. California*, 413 U.S. 15 (1973).

(39) *NFIB*, 142 S. Ct. at 667 (Gorsuch, J., concurring) (citations omitted).

(40) *UARG*, 573 U.S. 302, 324 (2014) (“When an agency claims to discover in a long-extant statute an unheralded power to regulate ‘a significant portion of the American economy,’ *Brown & Williamson*, 529 U.S. at 159 . . . , we typically greet its announcement with a measure of skepticism. We expect Congress to speak clearly if it wishes to assign to an agency decisions of vast ‘economic and political significance.’ *Id.* at 160.”); *Gundy v. United States*, 139 S. Ct. 2116, 2141-42 (2019) (*Gundy*) (Gorsuch, J., dissenting) (“Under our precedents, an agency can fill in statutory gaps where ‘statutory circumstances’ indicate that Congress meant to grant it such powers. But we don't follow that rule when the ‘statutory gap’ concerns ‘a question of deep economic and political significance’ that is central to the statutory scheme. So we've rejected agency demands that we defer to their attempts to rewrite rules for billions of dollars in healthcare tax credits, to assume control over millions of small greenhouse gas sources, and to ban cigarettes.) (citations omitted).

(41) *In re MCP No. 165*, 20 F.4th 264, 267-268 (6th Cir. 2021) (Sutton, C.J., dissenting from denial of initial hearing en banc) (emphases added).

(42) *Panhandle E. Pipe Line Co. v. Pub. Serv. Comm'n of Ind.*, 332 U.S. 507, 516 (1947) (“three things, and three things only Congress drew within its own regulatory power, delegated by the [Natural Gas] Act to its agent, the Federal Power Commission. These were: (1) The transportation of natural gas in interstate commerce; (2) its sale in interstate commerce for resale; and (3) natural gas companies engaged in such transportation or sale.”); cf. *Ala. Assn.*, 141 S. Ct. at 2488 (invalidating the CDC's eviction moratorium because the “downstream connection between eviction and the interstate spread of disease is markedly different from the direct targeting of disease that characterizes the measures identified in the statute”).

(43) *Am. Elec. Power Co. v. Conn.*, 564 U.S. 410, 426 (2011).

(44) *Id.* (“ Congress delegated to EPA the decision whether and how to regulate carbon-dioxide emissions from powerplants”) (emphasis added); *Am. Lung Ass'n. v. EPA*, 985 F.3d at 959-60 (D.C. Cir. 2021) (“there is no question that the regulation of greenhouse gas emissions by power plants across the Nation falls squarely within the EPA’s wheelhouse.”). Consider for a moment how strange it would be for Congress to delegate regulation of GHG emissions from electric power plants to EPA, while somehow delegating regulation of GHG emissions from natural gas fired power plants to FERC. Yet that is what today’s orders presuppose.

(45) *See Mountain Valley Pipeline, LLC*, 171 FERC ¶ 61,232 (2020) (McNamee, Comm’r, concurring at PP 32-40) (discussing decades’ worth of legislative enactments, all of which “indicates that the Commission’s authority over upstream production and downstream use of natural gas has been further limited by Congress.”).

(46) *U.S. Telecom Ass’n v. FCC*, 855 F.3d 381, 422 (Kavanaugh, J. dissenting) (emphases added); *see also NFIB*, 142 S. Ct. at 665 (“the question . . . is whether the Act plainly authorizes the Secretary’s mandate. It does not.”).

(47) We cannot assume a Congressional intent to regulate every incidence of greenhouse gas emissions. As Justice Ginsberg observed, “we each emit carbon dioxide merely by breathing.” *Am. Elec. Power Co. v. Conn.*, 564 U.S. at 426.

(48) *Ala. Ass’n.*, 141 S. Ct. at 2489.

(49) Congress may “delegate power under broad general directives” so long as it sets forth “an intelligible principle” to guide the delegee. *Mistretta v. United States*, 488 U.S. 361, 372 (1989). *See Gundy*, 139 S. Ct. at 2129 (“a delegation is constitutional so long as Congress has set out an ‘intelligible principle’ to guide the delegee’s exercise of authority. Or in a related formulation, the Court has stated that a delegation is permissible if Congress has made clear to the delegee the general policy he must pursue and the boundaries of his authority.”) (citations, internal quotations omitted).

(50) *Mountain Valley*, 171 FERC ¶ 61,232 (McNamee, Comm’r, concurring at P 41); *see also id.* PP 15-47.

(51) *See generally*, Ford P. Hall, *Certificates of Public Convenience and Necessity*, 28 Mich. L. Rev. 276 (1930) (analyzing the meaning of “public convenience and necessity” in State laws antedating passage of the NGA, and concluding that it is the need of the consuming public, without which it will be inconvenienced, that is the critical question to be answered).

(52) The first such statute appears to have been the Interstate Commerce Act (ICA). The Supreme Court explicitly held that the use of the term “public convenience and necessity” was chosen in the knowledge that it would be understood against the background of its historical usage. *ICC v. Parker*, 326 U.S. 60, 65 (1945) (construing “public convenience and necessity” under the ICA and recognizing that Congress’ decision to use a term with such a long history indicated Congress intended “a continuation of the administrative and judicial interpretation of the language.”) When it passed the NGA, Congress was similarly cognizant of having employed the same concept as in the ICA. *See*, Robert Christin et al., *Considering the Public Convenience and Necessity in Pipeline Certificate Cases under the Natural Gas Act*, 38 Energy L.J. 115, 120 (2017) (citing Comm. on Interstate Commerce, Interstate Transportation and Sale of Natural Gas, S. Rep. No. 75-1162, at 5 (Aug. 9, 1937) and noting that “the concept of a regulatory agency determining whether a private entity’s proposal was in the public convenience and necessity was an established practice when the NGA was enacted.”).

(53) See *In re Kan. Pipe Line & Gas Co.*, 2 FPC 29, 56 (1939) (“We view the term [public convenience and necessity] as meaning a public need or benefit without which the public is inconvenienced to the extent of being handicapped in pursuit of business or comfort or both without which the public generally in the area involved is denied to its detriment that which is enjoyed by the public of other areas similarly situated.”)

(54) NEPA, 42 U.S.C. 4321 *et seq.*, requires all federal agencies to undertake an “environmental assessment” of their actions, typically including the preparation of an “environmental impact statement” of proposed “major federal actions.” As discussed below, the purpose of the EA and EIS is for the agency to be fully informed of the impact of its decisions. NEPA does not mandate any specific action by the agency in response to an EA or EIS, other than to make an informed decision. See, e.g., Steven M. Siros, et al., *Pipeline Projects—The Evolving Role of Greenhouse Gas Emissions Analyses under NEPA*, 41 Energy L.J. 47 (May 2020); see also *Sabal Trail*, 867 F.3d at 1367-68 (describing NEPA as “primarily information-forcing” and noting that courts “should not ‘flyspeck’ an agency’s environmental analysis, looking for any deficiency no matter how minor.”) (quoting *Nevada v. Dep’t of Energy*, 457 F.3d 78, 93 (D.C. Cir. 2006)).

(55) NGA section 7(e), 15 U.S.C. 717f(e), authorizes the Commission to attach to a certificate “such reasonable terms and conditions as the public convenience and necessity may require.” There is no analytical difference between the Commission’s authority to reject a certificate application and its authority to mitigate it. See *Nat’l Fuel Gas Supply Corp. v. FERC*, 909 F.2d 1519, 1522 (D.C. Cir. 1990) (“The Commission may not, . . . when it lacks the power to promote the public interest directly, do so indirectly by attaching a condition to a certificate that is, in its unconditional form, already in the public convenience and necessity.”) (citations omitted). That the Commission may be tempted to abuse its conditioning authority has long been recognized. See Carl I. Wheat, *Administration by the Federal Power Commission of the Certificate Provisions of the Natural Gas Act*, 14 Geo. Wash. L. Rev. 194, 214-215 (1945) (“It is particularly important that the Commission . . . steel itself against the somewhat natural temptation to attempt to use such ‘conditions’ as substitutes or ‘shortcuts’ for other (and more appropriate) methods of regulation prescribed in the statute. . . . [W]hatever may be said with respect to conditions concerning rates and other matters over which the Commission has specific authority under other provisions of the Act, it would appear clear that the power to prescribe ‘reasonable conditions’ in certificates cannot be greater in scope than the statutory authority of the Commission.”)

(56) “[ I ] t is now well settled that NEPA itself does not mandate particular results, but simply prescribes the necessary process. If the adverse environmental effects of the proposed action are adequately identified and evaluated, the agency is not constrained by NEPA from deciding that other values outweigh the environmental costs. . . . Other statutes may impose substantive environmental obligations on federal agencies, . . . but NEPA merely prohibits uninformed—rather than unwise—agency action.” *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 350-51 (1989) (citations omitted; emphases added). See also, e.g., *Minisink Residents for Env’tl. Preserv. & Safety v. FERC*, 762 F.3d 97, 112 (D.C. Cir. 2014) (same).

(57) *Dep’t. of Transp. v. Pub. Citizen*, 541 U.S. 752, 767 (2004) ( *Pub. Citizen* ). This principle has been incorporated into the implementing regulations of the Council of Environmental Quality (CEQ), an executive branch agency. See 40 CFR 1508.1(g)(2) (2021) (“Effects do not include those effects that the agency has no ability to prevent due to its limited statutory authority or would occur regardless of the proposed action”).

(58) *Pub. Citizen*, 541 U.S. at 767 (citations omitted).

(59) Certificate Policy Statement at PP 73-76; GHG Policy Statement at PP 28-31.

(60) *Pub. Citizen*, 541 U.S. at 767 (citations omitted).

(61) See, e.g., *Sabal Trail*, 867 F.3d at 1372 (citing *Pub. Citizen*, 541 U.S. at 770) (“when the agency has no legal power to prevent a certain environmental effect, there is no decision to inform, and the agency need not analyze the effect in its NEPA review.”) (emphasis in original); *Citizens Against Burlington, Inc. v. Busey*, 938 F.2d 190, 195 (D.C. Cir. 1991) (“an agency need follow only a ‘rule of reason’ in preparing an EIS . . . and . . . this rule of reason governs both *which* alternatives the agency must discuss, and the *extent* to which it must discuss them.”) (internal citations and quotations omitted, emphasis in original). To state the obvious: We have absolutely no way of knowing how much an individual project may or may not contribute to global climate change for any number of reasons, including because there is no way for us to meaningfully evaluate the release of GHG emissions if the facility in question were not to be certificated. Notwithstanding, today, the majority boasts of forcing virtually every certificate applicant into the EIS process. GHG Policy Statement at PP 80, 88.

(62) *Pub. Citizen*, 541 U.S. at 767 (citations omitted).

(63) GHG Policy Statement at P 80, 88. For purposes of determining what emissions count toward the 100,000 metric tons per year threshold, the majority states that this number is measured based on “the construction, operational, downstream, and, where determined to be reasonably foreseeable, upstream GHG emissions that reoccur annually over the life of the project.” *Id.* P 80 & n.197.

(64) *Id.* PP 88-93 (acknowledging that the Supreme Court has partially invalidated EPA's regulatory regime).

(65) *Id.* P 89 (emphasis added).

(66) *Id.* P 95. It appears that the majority's intent is to force all applicants into the EIS process. This will undeniably cause each application to become far more costly and time-consuming, both obvious disincentives to even trying.

(67) EPA Comments, *Iroquois Gas Transmission Sys., L.P.*, Docket No. CP20-48-000 at 1-2 (filed Dec. 20, 2021) (EPA Dec. 20, 2021 Letter).

(68) And yet, as a practical matter, applicants must spend years of work and possibly millions of dollars (or more) in preparatory tasks like lining up financing, securing local political support, obtaining permits, etc. All this extensive legwork is needed just to put an application in to the Commission. Today's orders effectively tell applicants that their application could be rejected for any reason or no reason at all. Nor does the majority even do the courtesy of providing a target for the applicant to aim at.

(69) See Bradley C. Karkkainen, *Whither NEPA?*, N.Y.U. Envtl. L.J. 333, 339 & n.31 (2004) (noting that “Department of Energy EISs produced prior to 1994 had a mean cost of \$6.3 million and a median cost of \$1.2 million; following an aggressive effort to reduce costs, after 1994 the mean cost fell to \$5.1 million, but the median cost rose to \$2.7 million.”)

(70) See, *Nat. Res. Def. Council, Inc. v. EPA*, 822 F.2d 104, 129 (D.C. Cir. 1987) (“NEPA, as a procedural device, does not work a broadening of the agency's substantive powers. Whatever action the agency chooses to take must, of course, be within its province in the first instance.”) (citations omitted, emphasis added); *Balt. Gas & Elec. Co. v. Natural Res. Defense Council, Inc.*, 462 U.S. 87, 97 (1983) (acknowledging NEPA's “twin aims” as obligating an agency “to consider every significant aspect of the environmental impact of a proposed action” and ensuring “that the agency will inform the public that it has indeed considered environmental concerns in its decision-making process,” but noting that “Congress in enacting NEPA, however, did not require agencies to elevate environmental concerns over other appropriate considerations.”) (citations, alterations omitted).

- (71) 18 CFR 380.1 (2021) (emphasis added); see also 40 CFR 1500.3(a) (2021) (compliance with the CEQ regulations “is applicable to and binding on all Federal agencies . . . except where compliance would be inconsistent with other statutory requirements”).
- (72) 18 CFR 380.1 (2021). See The Hon. Joseph T. Kelliher Jan. 7, 2022 Comments, *Technical Conference on Greenhouse Gas Mitigation: Natural Gas Act Sections 3 and 7 Authorizations*, Docket No. PL21-3-000 at 2 (The Hon. Joseph T. Kelliher Jan. 7, 2022 Comments) (“if imposing mitigation for direct and indirect emissions discourages or forestalls pipeline development, the mitigation policy is directly contrary to the principal purpose of the Natural Gas Act and must be set aside.”).
- (73) Bradley C. Karkkainen, *Whither NEPA?*, N.Y.U. Env’tl. L.J. at 345-346 (noting that fear of NEPA challenges has led agencies to “kitchen sink” EISs to reduce the risk of reversal, but that almost nobody actually reads them “and those who attempt to do so may find it difficult to separate the good information from the junk. Contrary to conventional wisdom, more information is not always better.”); see also, *Pub. Citizen*, 541 U.S. at 768-769 (“NEPA’s purpose is not to generate paperwork—even excellent paperwork—but to foster excellent action.”) (quoting then-in effect 40 CFR 1500.1(c) (2003)).
- (74) The delay is clearly part of the point. Why else funnel virtually every certificate applicant into the EIS process? See e.g., Bradley C. Karkkainen, *Whither NEPA?*, N.Y.U. Env’tl. L.J. at 339-40 (observing that NEPA has become “a highly effective tool that environmental NGOs and others can use to raise the financial and political costs of projects they oppose and stretch out decisions over an extended time frame, giving time to rally political opposition.”). See also P 47, *infra*.
- (75) In fact, even if the Commission had the authority to impose upstream or downstream GHG emissions mitigation, or to deny certificates of public convenience and necessity on that basis, the majority admits that it is by no means obvious that doing so would actually prevent or even meaningfully reduce global climate change or the problems associated with it. See GHG Policy Statement at P 88 (noting that “[e]ven if deep reductions in GHG emissions are achieved, the planet is projected to warm by at least 1.5 degrees Celsius (°C) by 2050,” and that “even relatively minor GHG emissions pose a significant threat”).
- (76) *Vecinos Para El Bienestar de la Comunidad Costera v. FERC*, 6 F.4th 1321, 1329 (D.C. Cir. 2021) (*Vecinos*) (“Because the Commission failed to respond to significant opposing viewpoints concerning the adequacy of its analyses of the projects’ greenhouse gas emissions, we find its analyses deficient under NEPA and the APA.”).
- (77) Cf. The Hon. Joseph T. Kelliher Jan. 7, 2022 Comments at 3.
- (78) *Sabal Trail*, 867 F.3d 1357. In support of its assertion of broad discretion in attaching conditions to a certificate, the majority also cites to *ANR Pipeline Co. v. FERC*, 876 F.2d 124, 129 (D.C. Cir. 1989) (*ANR Pipeline*). Certificate Policy Statement at P 74 & n. 190. Since the Commission’s conditioning authority is limited in the same way as its certificating authority, there is little reason to discuss it separately. I will only note in passing that, although the court described the Commission’s conditioning authority as “extremely broad,” the only issue actually before the court in *ANR Pipeline* was the validity of certificate terms imposed in furtherance of the Commission’s core duty to ensure that rates are non-discriminatory. *Id.*
- (79) *Birckhead v. FERC*, 925 F.3d 510 (D.C. Cir. 2019) (rejecting, for failure to raise the issue before the Commission, a claim that NEPA requires FERC to analyze downstream GHG emissions). Since *Birckhead* was decided on jurisdictional grounds, any substantive commentary in that order is mere dicta and I will not discuss it further.
- (80) *Vecinos*, 6 F.4th 1321.

(81) Both orders suffer from a number of infirmities that don't bear belaboring in this context. In brief, however, *Sabal Trail* reads the Commission's duty to "balance `the public benefits against the adverse effects of the project, including adverse environmental effects,'" *Sabal Trail*, 867 F.3d at 1373 (quoting *Minisink Residents for Env'tl. Pres. & Safety v. FERC*, 762 F.3d 97 at 101-02 and citing *Myersville Citizens for a Rural Cmty. v. FERC*, 783 F.3d at 1309), far too expansively, and *Vecinos* compounds that error. Both orders are discussed below.

(82) Namely, "[b]ecause FERC could deny a pipeline certificate on the ground that the pipeline would be too harmful for the environment, the agency is a `legally relevant cause' of the direct and indirect environmental effects of pipelines that it approves." *Sabal Trail*, 867 F.3d at 1373. The other orders the majority relies on depend vitally on this statement. See, e.g., Certificate Policy Statement at PP 75 & n. 192 (citing *Birckhead* ); 86 & n. 207 (citing *Vecinos* ); GHG Policy Statement at PP 13, 36-38 (citing *Birckhead* ) and P 14 & n. 38 (citing *Vecinos* ).

(83) See *Ctr. for Biological Diversity*, 941 F.3d at 1300 ("the legal analysis in *Sabal Trail* is questionable at best. It fails to take seriously the rule of reason announced in *Public Citizen* or to account for the untenable consequences of its decision. The *Sabal Trail* court narrowly focused on the reasonable foreseeability of the downstream effects, as understood colloquially, while breezing past other statutory limits and precedents—such as *Metropolitan [Edison Co. v. People Against Nuclear Energy]*, 460 U.S. 776 (1983)] and *Public Citizen*—clarifying what effects are cognizable under NEPA.").

(84) *Sabal Trail*, 867 F.3d at 1372-1373. In each of the D.C. Circuit orders *Sabal Trail* purported to distinguish, the court had found that FERC did not have to analyze, because it could not regulate, downstream emissions.

(85) *Id.* at 1373 (citing *Sierra Club v. FERC (Freeport)*, 827 F.3d 36, 47 (D.C. Cir. 2016). The "companion cases" are *Sierra Club v. FERC (Sabine Pass)*, 827 F.3d 59 (D.C. Cir. 2016) and *EarthReports, Inc. v. FERC*, 828 F.3d 949 (D.C. Cir. 2016).

(86) *Sabal Trail*, 867 F.3d at 1373 (emphasis in original).

(87) *Id.* (citations omitted).

(88) *Id.*

(89) *Supra*, Section I.B. Cf. *ICC v. Parker*, 326 U.S. 60, 65 (1945) (construing "public convenience and necessity" under the Interstate Commerce Act and recognizing that Congress' decision to use a term with such a long history indicated Congress intended "a continuation of the administrative and judicial interpretation of the language."). Far from being "a continuation of the administrative and judicial interpretation of the language," construing it to extend to an analysis of global GHG emissions is novel and unprecedented.

(90) *Vecinos*, 6 F.4th at 1328-30.

(91) 40 CFR 1502.21(c).

(92) See *supra*, n. 83.

(93) *NFIB*, 142 S. Ct. 661.

(94) *Ala. Ass'n.*, 141 S. Ct. 2485 at 2489.

(95) See generally, *Allegheny Def. Project v. FERC*, 964 F.3d 1, 18 (D.C. Cir. 2020) (noting that circuit court precedent may be departed from "when intervening developments in the law—such as Supreme Court decisions—have removed or weakened the conceptual underpinnings of the prior decision.") (cleaned up, citation omitted).

(96) In his *NFIB* concurrence, Justice Gorsuch states: “Sometimes Congress passes broadly worded statutes seeking to resolve important policy questions in a field while leaving an agency to work out the details of implementation. Later, the agency may seek to exploit some gap, ambiguity, or doubtful expression in Congress’s statutes to assume responsibilities far beyond its initial assignment. The major questions doctrine guards against this possibility by recognizing that Congress does not usually hide elephants in mouseholes.” 142 S. Ct. at 669 (Gorsuch, J., concurring) (citations, alterations omitted). It would be hard to find a better description of the path the Commission has taken to arrive at today’s orders.

(97) See, e.g., Bloomberg Philanthropies, <https://www.bloomberg.org/environment/moving-beyond-carbon/> (“Launched in 2019 with a \$500 million investment from Mike Bloomberg and Bloomberg Philanthropies, Beyond Carbon . . . works . . . to . . . *stop the construction of proposed gas plants.*”) (last visited Feb. 8, 2022) (emphasis added); Sierra Club, <https://www.sierraclub.org/policy/energy/fracking>, (“There are no ‘clean’ fossil fuels. The Sierra Club is committed to *eliminating the use of fossil fuels*, including coal, *natural gas* and oil, as soon as possible”) (emphases added) (last visited Feb. 8, 2022); Natural Resources Defense Council, <https://www.nrdc.org/issues/reduce-fossil-fuels> (“Oil, *gas*, and other fossil fuels come with grave consequences for our health and our future. . . . *NRDC is pushing America to move beyond these dirty fuels. We fight dangerous energy development on all fronts*”) (emphases added) (last visited Feb. 8, 2022); Press Release, *NRDC Receives \$100 million from Bezos Earth Fund to Accelerate Climate Action* (Nov. 16, 2020), available at <https://www.nrdc.org/media/2020/201116> (“The Bezos Earth Fund grant will be used to help NRDC advance climate solutions and legislation at the State level, move the needle on policies and programs focused on *reducing oil and gas production*”) (emphasis added) (last visited Feb. 8, 2022); Sebastian Herrera, *Jeff Bezos Pledges \$10 Billion to Tackle Climate Change*, Wall Street Journal (Feb. 17, 2020) (“Mr. Bezos . . . said the *Bezos Earth Fund* would help back scientists, *activists, [non-governmental organizations]*”) (emphasis added); see also, Ellie Potter, *Environmentalists launch campaign to ban gas from US clean energy program*, S&P Global Platts (Sep. 2, 2021) (quoting Collin Rees, U.S. Campaign Manager for Oil Change International, “Clean energy means *no gas* and no other fossil fuels, period.”) (emphases added); Sean Sullivan, *FERC sets sights on gas infrastructure policy in 2022*, S&P Capital IQ (Dec. 31, 2021) (quoting Maya van Rossum, head of Delaware Riverkeeper Network, “we are not changing course at all: We continue to take on every pipeline, LNG, and fracked gas project as urgently as we did before, knowing we will have to *invest heavily to stop it . . .*”) (emphases added).

(98) See Letter of Chairman Richard Glick to Sen. John Barasso, M.D. (Feb. 1, 2022) (“Preparing an EIS to consider the reasonably foreseeable GHG emissions that may be attributed to a project proposed under section 7 of the NGA allows the Commission to issue more legally durable orders on which all stakeholders can depend, including project developers.”); Letter of Commissioner Allison Clements to Sen. John Barasso, M.D. (Feb. 1, 2022) (“I will do my part to assure that the updated policy will be a legally durable framework for fairly and efficiently considering certificate applications—one that serves the public interest and increases regulatory certainty for all stakeholders.”); see also, Corey Paul, *FERC Dems argue legal benefits from climate reviews outweigh gas project delays*, S&P Capital IQ Pro (Feb. 3, 2022).

(99) Certificate Policy Statement at P 100 (“the Commission will apply the Updated Policy Statement to any currently pending applications for new certificates. Applicants will be given the opportunity to supplement the record and explain how their proposals are consistent with this Updated Policy Statement, and stakeholders will have an opportunity to respond to any such filings.”)

(100) *Adelphia Gateway, LLC*, 178 FERC ¶ 61,030 (2022) (Christie, Comm’r concurring at P 4) (available at: <https://www.ferc.gov/news-events/news/item-c-3-commissioner-christies-partial-concurrence-and-partial-dissent-adelphia> ).

(101) See *Am. Lung Ass'n v. EPA*, 985 F.3d at 1003 (Walker, J., concurring in part and dissenting in part) (“whatever multi-billion-dollar regulatory power the federal government might enjoy, it’s found on the open floor of an accountable Congress, not in the impenetrable halls of an administrative agency—even if that agency is an overflowing font of good sense.”) (citing U.S. Const. art I, section 1).

(102) GHG Policy Statement at PP 27-28, 31, & n.97. See also, EPA Dec. 20, 2021 Letter.

(103) GHG Policy Statement at P 96. See also, e.g., *Vecinos*, 6 F.4th at 1328-1329.

(104) EPA Dec. 20, 2021 Letter at 4 (emphases added).

(105) This Commission’s independence reflects a conscious choice on Congress’ part to insulate certain of its functions from the vicissitudes of political pressure. See generally, Sharon B. Jacobs, *The Statutory Separation of Powers*, 129 Yale L.J. 378 (2019) (explaining that some but not all of the Federal Power Commission’s authorities were transferred to FERC, which was intended at least in part to counterbalance presidential influence). Succumbing to the pressure of EPA and others would sacrifice that crucial independence in meaningful ways.

(106) Cf. *Vecinos*, 6 F.4th at 1329.

(107) It has been observed that the values associated with the imputed social costs of GHG emissions have fluctuated dramatically from one administration to the next. See, e.g., Garrett S. Kral, *What’s In a Number: The Social Cost of Carbon*, Geo. Envtl. L. Rev. Online 1 (Aug. 19, 2021) (comparing the social cost of GHG emissions under the Trump administration with the interim social cost under the Biden administration and noting “the value of SC-GHGs have fluctuated. A lot.”). This degree of abrupt fluctuation— e.g., the social cost of carbon increasing from \$7 per ton to \$51 per ton—can only be explained by politics, not science.

(108) *NFIB*, 142 S. Ct. at 667 (Gorsuch, J. Concurring). (“The central question we face today is: *Who decides?*”) (emphasis added).

(109) See P 5 and n.12, *supra*.

(110) *Office of Consumers Counsel*, 655 F.2d at 1142 (“an agency may not bootstrap itself into an area in which it has no jurisdiction by violating its statutory mandate”) (quoting *FMC v. Seatrain Lines, Inc.*, 411 U.S. 726, 745 (1973)) (ellipsis omitted); see also *In re MCP No. 165*, 20 F.4th 264, 269 (6th Cir. 2021) (Sutton, C.J., dissenting) (“As the Supreme Court recently explained in invalidating an eviction moratorium promulgated by the Center for Disease Control, ‘our system does not permit agencies to act unlawfully even in pursuit of desirable ends.’ *Ala. Ass’n of Realtors*, 141 S. Ct. at 2490. Shortcuts in furthering preferred policies, even urgent policies, rarely end well, and *they always undermine, sometimes permanently, American vertical and horizontal separation of powers, the true mettle of the U.S. Constitution, the true long-term guardian of liberty.*”) (emphasis added).

(111) This argument is often put forth by the legal, academic, and corporate elites who assume that an administrative agency will enact the public policies they prefer when Congress will not. Such an expectation is perfectly rational since these elites disproportionately have the resources that are most effective in achieving desired outcomes in the administrative process, which is largely an insiders’ game. The body of work on the economic theory of regulatory capture over the past half-century is relevant to this topic. See generally, Susan E. Dudley, *Let’s Not Forget George Stigler’s Lessons about Regulatory Capture*, Regulatory Studies Center (May 20, 2021) (available at <https://regulatorystudies.columbian.gwu.edu/let%E2%80%99s-not-forget-george-stigler%E2%80%99s-lessons-about-regulatory-capture> ). And it is not just for-profit corporate elites at work here, so are other special interests who seek desired policy outcomes from administrative action rather than from the often messy and hard democratic processes of seeking to persuade voters to elect members of Congress who agree with you. See, e.g., n. 97, *supra*.

## LEGAL STATUS

This site displays a prototype of a “Web 2.0” version of the daily Federal Register. It is not an official legal edition of the Federal Register, and does not replace the official print version or the official electronic version on GPO’s govinfo.gov.

The documents posted on this site are XML renditions of published Federal Register documents. Each document posted on the site includes a link to the corresponding official PDF file on govinfo.gov. This prototype edition of the daily Federal Register on FederalRegister.gov will remain an unofficial informational resource until the Administrative Committee of the Federal Register (ACFR) issues a regulation granting it official legal status. For complete information about, and access to, our official publications and services, go to [About the Federal Register](#) on NARA’s archives.gov.

The OFR/GPO partnership is committed to presenting accurate and reliable regulatory information on FederalRegister.gov with the objective of establishing the XML-based Federal Register as an ACFR-sanctioned publication in the future. While every effort has been made to ensure that the material on FederalRegister.gov is accurately displayed, consistent with the official SGML-based PDF version on govinfo.gov, those relying on it for legal research should verify their results against an official edition of the Federal Register. Until the ACFR grants it official status, the XML rendition of the daily Federal Register on FederalRegister.gov does not provide legal notice to the public or judicial notice to the courts.

## ENHANCED CONTENT

## PUBLISHED DOCUMENT

[Start Printed Page 74236](#)**AGENCY:**

National Highway Traffic Safety Administration (NHTSA), Department of Transportation (DOT).

**ACTION:**

Final rule.

**SUMMARY:**

This document finalizes NHTSA's proposal to repeal in full "The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program," published September 27, 2019 (SAFE I Rule), in which NHTSA codified regulatory text and made additional pronouncements regarding the preemption of state and local laws related to fuel economy standards. NHTSA originally proposed to repeal the SAFE I Rule in a Notice of Proposed Rulemaking entitled "Corporate Average Fuel Economy Preemption," which was published on May 12, 2021. After evaluating all public comments submitted for this Proposal, the Agency is finalizing the Proposal. As such, the Agency is repealing all regulatory text and appendices promulgated in

the SAFE I Rule. In doing so, the Agency underscores that any positions announced in preambulatory statements of prior NHTSA rulemakings, including in the SAFE I Rule, which purported to define the scope of preemption under the Energy Policy and Conservation Act (EPCA), do not reflect the Agency's reconsidered understanding of its proper role in matters of EPCA preemption. Through this final rule, NHTSA makes clear that no prior regulations or positions of the Agency reflect ongoing NHTSA views on the scope of preemption of states or local jurisdictions under EPCA.

## **DATES:**

This action is effective on January 28, 2022.

*Petitions for Reconsideration:* Pursuant to 49 CFR 553.35 (<https://www.ecfr.gov/current/title-49/section-553-35>), petitions for reconsideration of this final rule must be received not later than February 14, 2022.

## **ADDRESSES:**

Any petitions for reconsideration should refer to the docket number of this document and be submitted to: Deputy Administrator, National Highway Traffic Safety Administration, 1200 New Jersey Avenue SE, West Building, Fourth Floor, Washington, DC 20590.

## **FOR FURTHER INFORMATION CONTACT:**

Hunter B. Oliver, Office of Chief Counsel, NHTSA, telephone (202) 366-5263, facsimile (202) 366-3820, 1200 New Jersey Ave. SE, Washington, DC 20590.

## I. Overview of Final Rule

### A. Summary of Proposal

On May 12, 2021, NHTSA published in the **Federal Register** a Notice of Proposed Rulemaking (NPRM or Proposal) entitled “Corporate Average Fuel Economy (CAFE) Preemption,” which set forth the proposal that NHTSA is finalizing today.<sup>[1]</sup> As explained in the Proposal, this NPRM considered a repeal of NHTSA's portion of a joint agency action completed by NHTSA and the Environmental Protection Agency (EPA) in 2019, “The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program” (SAFE I Rule or Rule).<sup>[2]</sup> In the SAFE I Rule, NHTSA and EPA finalized a joint agency action relating to the state regulation of greenhouse gas (GHG) emissions from motor vehicles and state mandates for zero emission vehicles (ZEVs). In that action, NHTSA codified regulatory text and appendices, which expressly declared that certain types of state regulation were preempted due to a perceived irreconcilable conflict with the Agency's fuel economy standards. In addition, the Agency published further statements in the preambles of the SAFE I rulemaking, which described various types of state regulations as preempted. As part of the SAFE I action, EPA also withdrew portions of a waiver that EPA had previously extended to the California Air Resources Board (CARB) under Section 209 of the Clean Air Act to regulate new motor vehicle emissions through GHG standards and a ZEV mandate.<sup>[3]</sup>

On January 20, 2021, President Biden signed Executive Order 13990 (/executive-order/13990), “Protecting Public Health and the Environment and Restoring Science To Tackle the Climate Crisis,” which, among other actions, directed DOT, NHTSA, and EPA to immediately review and consider suspending, revising, or rescinding their respective portions of the SAFE I Rule. NHTSA's resulting comprehensive assessment of the SAFE I Rule identified potential problems relating to both the legal authority claimed by NHTSA for the rulemaking and the degree to which the categorical prohibitions announced by the Agency failed to appropriately account for the substantial and often nuanced state interests in the measures purportedly preempted by the SAFE I Rule. As a result of these considerations, NHTSA published the NPRM, to propose a repeal of the SAFE I Rule and to solicit public comment on the Agency's concerns about the legality and prudence of the rulemaking. On April 28, 2021, EPA outlined its own review of the EPA aspects of the SAFE I joint agency action, publishing a Notice of Opportunity for Public Hearing and Comment that proposed a reconsideration of EPA's withdrawal of California's waiver under the Clean Air Act.<sup>[4]</sup> Both agencies have expressly recognized that their respective reconsideration proposals are separate, independent proceedings.<sup>[5]</sup>

In the CAFE Preemption NPRM, NHTSA proposed to repeal the SAFE I Rule for several independent reasons. First, the Agency repeatedly expressed substantial doubts regarding the legal validity of the Rule. As the NPRM explained, NHTSA became concerned about whether the Agency possesses the authority to define the scope of EPCA through rulemaking. Accordingly, NHTSA proposed to repeal and withdraw the codified regulations and appendices, as well as any associated interpretations or views on EPCA preemption contained in the SAFE I Rule, including in the regulatory text of Sections 531.7, 533.7, and appendices B to Parts 531 and 533.

In the Proposal, NHTSA recognized that the statutory preemption provision in EPCA, Section 32919, was self-executing. In this respect, Section 32919 is able to preempt state or local laws directly, without the need for a DOT or NHTSA regulation that further implements either EPCA preemption or this particular statutory provision. As such, the statutory provision is both standalone and fails to articulate any role for the Agency in further dictating a preemptive scope. Accordingly, the NPRM proposed that Section 32919 and EPCA were more appropriately read as indicating that Congress did not intend to empower NHTSA to define preemption in this manner. As a result, NHTSA's Proposal expressed concern that in the SAFE I Rule, the Agency acted outside of its delegated authority by publishing regulations and pronouncements that sought to do just such a thing. Accordingly, the NPRM proposed to repeal the SAFE I Rule.

In addition, the Proposal also articulated a separate basis for repealing the entirety of the SAFE I Rule, which rested upon the inappropriateness of such a sweeping pronouncement of preemption. Even if EPCA had imbued NHTSA with power to dictate preemption through regulations, the expansive manner in which this authority was wielded in the SAFE I rulemaking failed to appropriately account for a variety of important considerations. These include legally relevant factors, such as the substantial federalism interests of states and local jurisdictions who had long relied on programs to address environmental hazards in their local communities or comply with other federal air pollution requirements. In addition, the categorical and generally applicable scope of the SAFE I Rule also precluded consideration of other fact-specific attributes of particular programs, many of which represent diverse characteristics that bear upon the application of EPCA preemption and the accuracy of any ensuing preemption analysis. Many of these factors—some of which were not even discussed in the SAFE I rulemaking—strongly suggest that a more considered and circumscribed dispensation of any preemption authority would more narrowly tailor any preemptive pronouncements to better account for the diverse, nuanced, and relied upon federalism interests of the preempted state governments and their constituents. As described further below, these concerns were raised and expressed by a significant number of public comments, especially from those local jurisdictions most affected by the rulemaking. These jurisdictions described numerous unique considerations regarding their programs that the SAFE I Rule's absolute proclamation of preemption did not fully contemplate. These considerations reflected the Agency's similar concerns in the NPRM, which proposed to repeal the SAFE I Rule in its entirety in order to establish a “clean slate,” that restores NHTSA's longstanding practice of undertaking a more careful and particularized role in the EPCA preemption discourse.

Finally, even apart from the lack of rulemaking authority and the overly broad manner of the SAFE I Rule's prohibitions, the NPRM also proposed a repeal of the SAFE I Rule in order to remove the regulation that overcomplicated or potentially confused an otherwise direct application of Section 32919's statutory standards. In connection with a proposed repeal of the regulatory text from the SAFE I Rule, the NPRM also proposed to clarify that, to the extent prior statements from rulemaking preambles (from the SAFE I Rule or otherwise) discussed aspects of EPCA preemption or could be read as interpretative views on the subject, those statements should not be read as continuing views of the Agency. While this clarification was not

legally necessary, NHTSA still considered it worthwhile because the inconsistent nature of many of the Agency's prior statements on EPCA preemption and the oftentimes imperative language utilized in such statements—especially during the SAFE I rulemaking—risked a confusing landscape in which regulated entities and the public were unsure of the precise legal effect of Agency statements that purported to control EPCA's preemptive reach. Moreover, NHTSA felt that many of those statements, particularly in the preambles of the SAFE I Rule, contained sweeping and definitive language on preemption, which left no room for nuance or further deliberation about particular programs, and obscured the Agency's ongoing internal consideration of whether EPCA actually enacted a narrower scope of preemption than claimed in the rulemaking. In light of these considerations, the NPRM proposed to expressly disclaim any of these prior statements to make clear they no longer accurately reflected the Agency's position on the issue.

## **B. Public Participation Opportunities and General Overview of Comments**

The public docket opened for this rulemaking following the **Federal Register** publication of the NPRM on May 12, 2021. The public comment period spanned 30 days, with comments due on June 11, 2021. During that time, the Agency received 445 comments. As of the date of today's final rule, NHTSA has not received any late comments posted after the close of the comment period.<sup>[6]</sup>

NHTSA closely reviewed each of the comments posted to the docket for this Proposal. While NHTSA is responding to the particular comments in further detail in the substantive analysis in the following sections of this final rule, at a high level, the public comments spanned a diverse array of state and local jurisdictions, regulated entities and trade associations for regulated industries, public interest groups and other nonprofit organizations, and individual members of the public. The Agency appreciates the time and effort dedicated by these parties in submitting their comments and is grateful for the diversity and depth of views, both for and against the Proposal, expressed by the commenters.

Overall, the Agency received comments spanning the entire spectrum of perspectives with respect to the Proposal. The vast majority of comments from the entities most immediately affected by the rulemaking, *i.e.*, states and local jurisdictions, strongly supported the Proposal. In particular, as explained further below, many of these comments provided tangible examples of hardships imposed  by the SAFE I Rule and identified nuanced aspects of their affected programs that were not fully considered during the SAFE I rulemaking. Likewise, comments from entities or associations in the automotive industry, who are directly affected by motor vehicle emission regulations, largely tended to support the Proposal or offer more neutral views. With a few exceptions, most other institutional commenters strongly supported the rulemaking as well. Such commenters consisted of public interest groups, such as environmental or consumer advocacy organizations, who overwhelmingly supported the Proposal and urged a swift repeal of the SAFE I Rule for many of the same reasons expressed in the NPRM.

Start Printed  
Page 74238

The Agency also received several institutional comments that expressly opposed the Proposal. While these comments are discussed in depth later in this final rule, in a general sense, these comments urged the Agency to retain the SAFE I Rule in its entirety. Many of these comments defended the substantive validity of the preemption scope announced in the SAFE I Rule, and construed NHTSA's governing authorities as delegating to the Agency the power to regulate preemption in the manner attempted in that rulemaking. Several of these comments also questioned the sufficiency of NHTSA's proposed justifications to repeal the SAFE I Rule, essentially arguing that NHTSA could not reasonably repeal a substantive position on preemption without replacing it with an alternative substantive view. While a number of individuals commented in support of the Proposal, the Agency recognizes that many individual members of the public also opposed a repeal of the SAFE I Rule.<sup>[7]</sup>

Finally, a significant portion of the comments raised, either in full or in part, issues beyond the narrow scope on which NHTSA proposed to repeal the SAFE I Rule. Such topics, which appeared in comments both supportive of and opposed to the Proposal, tended to focus on the substantive aspects of the CAFE program, such as the appropriate levels of fuel economy stringency, the effect of any particular state programs on the environment or vehicle fleets, or specific vehicle technologies, such as electrification. Likewise, as anticipated in the NPRM, many of the commenters also articulated substantive views on the appropriate scope of EPCA preemption.<sup>[8]</sup> NHTSA recognizes that many of these issues pose important societal or public policy questions and, in fact, analyzed a number of these topics in significant detail as part of its standard-setting analysis proposed in the **Federal Register** on September 3, 2021, “Corporate Average Fuel Economy Standards for Model Years 2024-2026 Passenger Cars and Light Trucks.”<sup>[9]</sup> Nevertheless, most of these issues do not directly speak to the proposed bases of NHTSA's repeal of the SAFE I Rule, given the very narrow scope of this rulemaking, which principally arose from a reconsideration of the discrete legal issues that underpinned the exercise of Agency authority in the SAFE I rulemaking. As such, while NHTSA greatly appreciates the efforts of commenters to submit such views and thoroughly reviewed them as part of the Agency's continuous efforts to understand broader public perspectives on NHTSA's fuel economy responsibilities, such views do not directly bear upon today's final rule.

### C. Finalized Approach

Today's final rule finalizes the proposal set forth in the CAFE Preemption NPRM. As such, this final rule repeals all aspects of the SAFE I Rule, both the codified regulatory text and the accompanying pronouncements about the scope of CAFE preemption. Specifically, the final rule repeals 49 CFR Sections 531.7 (“Preemption”) and 533.7 (“Preemption”), as well as each Appendix B in 49 CFR part 531 (<https://www.ecfr.gov/current/title-49/part-531>) (“APPENDIX B TO PART 531—PREEMPTION”) and Part 533 (“APPENDIX B TO PART 533—PREEMPTION”). In doing so, NHTSA's regulations will return to the same state for which they existed throughout the nearly 50-year history of the Agency's CAFE program—in which no regulation existed to purport to broadly define the scope of EPCA preemption.

In finalizing this Proposal, NHTSA concludes that it lacked authority to dictate the scope of EPCA preemption enacted in Section 32919. The plain language of Section 32919 establishes a clearly executable preemptive framework that can be applied by any reviewing court in the absence of an Agency regulation purporting to further dictate EPCA's preemptive scope. This conclusion is not simply presupposition, but as NHTSA's Proposal referenced and many commenters subsequently emphasized, the self-sufficiency of Section 32919 is a straightforward historical observation demonstrated by the provision's repeated application by Federal courts across the country—both to uphold and to preempt various state and local laws. The text of Section 32919 does not mention any role for NHTSA in codifying binding preemption requirements, nor does it state that the Agency is conferred with preemption rulemaking authority. Instead, the statute is self-executing and suffices to control the preemption analysis. The courts retain their authority to decide preemption questions; furthermore, the Agency may, consistent with law, provide interpretations of CAFE preemption questions other than by legislative rule. Thus, repeal of the SAFE I Rule is not simply appropriate, but a necessary measure to ensure that NHTSA is acting within the appropriate scope of its authority under EPCA.

In addition, today's final rule also concludes that a repeal of the SAFE I Rule is appropriate irrespective of whether NHTSA had legal authority for the SAFE I rulemaking. Through both its regulations and preambulatory language, the SAFE I Rule sweepingly preempted expansive categories of state and local motor vehicle emissions regulations. In doing so, the SAFE I Rule imposed immutable preemption requirements of general applicability, while ignoring the substantially important federalism interests affected

by such prohibitions. Many of the comments from states and local jurisdictions underscored this position, identifying specific state programs affected by the SAFE I Rule that those states had previously relied on to protect their citizens from environmental hazards and to meet federal obligations, such as attainment goals for National Ambient Air Quality Standards for criteria pollutants.<sup>[10]</sup> By imposing categorical preemption prohibitions without regard for such considerations, the SAFE I Rule impermissibly failed to account for legally relevant factors, such as reliance interests of states and local jurisdictions in longstanding programs potentially affected by the Rule. In doing so, the SAFE I Rule precluded potential avenues for a more tailored approach that considered programs in a more particularized setting rather than prematurely overriding those federalism interests in a categorical manner.

Moreover, by purporting to preempt abstract categories of regulation, the SAFE I Rule's prohibitions were both categorical and anticipatory—largely precluding entire subjects of state regulations without analyzing important factual questions or variables, such as the particulars of state programs, their specific manners of implementation, or possible scientific developments that may affect the relevant technologies. Therefore, even if the SAFE I Rule constituted a legitimate exercise of the Agency's authority, it represented an overly broad attempt to preempt state and local laws that precluded more detailed, and therefore potentially more accurate, considerations of specific programs. As such, NHTSA considers the SAFE I Rule's categorical and anticipatory scope to express an inappropriately broad and restrictive view on EPCA preemption. Accordingly, independent from the authority question, the SAFE I Rule conflicts with the need for a more focused consideration of preemption issues and, as such, must be repealed.

Finally, as part of today's notice, NHTSA is also expressly emphasizing that language in the preamble statements of other rulemakings, including the SAFE I Rule, which purport to dictate the scope of EPCA preemption, should no longer be viewed as the position of the Agency.<sup>[11]</sup> Indeed, several commenters expressed a view that those statements should be naturally understood as defunct upon a formal repeal of any attendant regulatory text.<sup>[12]</sup> In any event, given the degree to which many of these statements—especially in the SAFE I Rule—employ absolute language and purport to outright prohibit certain regulations, the Agency feels that it is important to make abundantly clear that these statements should not be read out of context to suggest that they remain current views of the Agency. This ensures that parties otherwise affected by such statements are not confused about whether the admonitions and prohibitions contained in the statements, which remain published in the **Federal Register** even after the repeal of the actual regulations from the Code of Federal Regulations, continue to apply.

## II. Final Rule

### A. This Final Rule Is a Proper Exercise of NHTSA's Reconsideration Authority

As emphasized in the Proposal, NHTSA, like any other Federal agency, is afforded an opportunity to reconsider prior views and, when warranted, to adopt new positions. Indeed, as a matter of good governance, agencies *should* revisit their positions when appropriate, especially to ensure that their actions and regulations reflect legally sound interpretations of the agency's authority and remain consistent with the agency's views and practices.

The need for an ongoing reconsideration of prior positions applies to both reevaluations of an agency's statutory authority, as well as reassessments of policy decisions. Overwhelmingly, commenters to this Proposal did not question the general discretion of NHTSA, as a Federal agency, to reconsider either statutory or policy-based decisions. Indeed, most commenters expressly supported NHTSA's reconsideration efforts and articulated numerous reasoned justifications for the undertaking. The few commenters who

opposed the reconsideration tended to focus on the adequacy of the *reasons* for the reconsideration rather than NHTSA's prerogative to conduct the reconsideration. Such objections are addressed below within the specific reconsideration basis to which they were directed. However, a small number of dissenting comments raised issues more broadly applicable to the reconsideration process.

## **I. THE AGENCY'S RECONSIDERATION AUTHORITY APPLIES IRRESPECTIVE OF ANY CHANGES IN FACTS OR CIRCUMSTANCES**

Several commenters contended that the Agency lacks a sufficient legal basis to withdraw the SAFE I Rule, arguing that no legal or factual circumstances changed between the issuance of the SAFE I Rule and the Proposal.<sup>[13]</sup> At the outset, it is important to be clear that the procedural question of whether an agency may reconsider a prior action is separate from whether the reconsideration is itself reasonable. We discuss the first here, while we address the second issue below in Part II.B. NHTSA does not agree that no relevant legal or factual developments occurred following the SAFE I Rule. But even before reaching this question, the Agency stresses that the governing administrative law framework does not require that any such changes occur before an agency may reconsider a prior position. A change in factual circumstances is only one amongst a host of different reasons that may cause an Agency to reconsider a prior agency action. Agencies may reconsider an issue “for example, in response to changed factual circumstances, or a change in administrations.”<sup>[14]</sup> Pure policy reconsiderations also remain sufficient grounds, with “evolving notions” about the appropriate balance of varying policy considerations constituting sufficient reason for a change in position.<sup>[15]</sup> This is all part of the natural and appropriate role of an agency engaging in informed rulemaking, which “must consider varying interpretations and the wisdom of its policy on a continuing basis.”<sup>[16]</sup>

This reconsideration exemplifies the types of reassessments for which a change in facts is not required or even particularly pertinent. As described throughout this notice, NHTSA's repeal of the SAFE I Rule is especially necessary because the Agency no longer reads EPCA as providing NHTSA the authority to dictate the scope of preemption through regulations. This is principally a narrow legal determination, which focuses on whether Congress intended to provide the requisite rulemaking authority to the Agency. Such a question does not turn upon factual circumstances, but instead depends upon a statutory construction of Section 32919. Further, as discussed below, even if the prior rule was a valid exercise of its authority, NHTSA concludes that the SAFE I Rule was overly broad and restrictive as it ignored important reliance interests and distinctions within state and local laws.

Even so, NHTSA notes that new factual developments since the SAFE I Rule's 2019 promulgation have □ occurred. Commenters stressed many of these factual updates as illustrative of the sweeping scope of the SAFE I Rule. For example, since the SAFE I Rule's promulgation, several additional states have expressed a desire to adopt future motor vehicle emissions measures under Section 177 of the Clean Air Act.<sup>[17]</sup> Moreover, many commenters stressed that every successive year, additional information and scientific data emerges regarding the climate crisis.<sup>[18]</sup> Multiple other comments emphasized that technological progress on motor vehicle emissions reduction strategies creates a dynamic regulatory landscape in which compliance paths are more complex than the static assumptions in the SAFE I Rule.<sup>[19]</sup> Thus, even though a change in facts is not necessary for NHTSA's reconsideration to occur, the Agency disagrees with several commenters who argued that no factual circumstances have changed since the SAFE I rulemaking occurred.

□ Start Printed  
Page 74240

## **II. THE AGENCY CAN RECONSIDER THE SAFE I RULE WITHOUT THE NEED TO ANNOUNCE NEW SUBSTANTIVE POSITIONS ON EPCA PREEMPTION**

Several other commenters opposed the Proposal by arguing that any repeal of the SAFE I Rule that did not announce a new substantive position on EPCA preemption was arbitrary and capricious. These comments especially criticized aspects of the Proposal, such as footnote 8, that expressly clarified that any new substantive conclusions on EPCA preemption were “outside the scope of this Proposal.”<sup>[20]</sup> For instance, a joint comment submitted by a collection of entities, including the Competitive Enterprise Institute (CEI), labeled the Proposal “the first-ever assertion of regulatory cancel culture” because “the NPRM declines to debate the opinions it proposes to delete.”<sup>[21]</sup> Ultimately, these commenters suggested that NHTSA could not repudiate the views of EPCA preemption announced in the SAFE I Rule without simultaneously replacing those views with a new substantive position on preemption.

NHTSA understands that many commenters feel strongly about the important policy dynamics underlying the scope of EPCA preemption. This applies both to commenters such as CEI, who support sweeping EPCA preemption and seek to defend the substance of the SAFE I Rule’s scope,<sup>[22]</sup> and to commenters who prefer NHTSA to declare expressly that EPCA preemption is inapplicable to state programs.<sup>[23]</sup> Several such comments that oppose the rulemaking argue that unless the agency announces new substantive positions on EPCA preemption, it has failed to provide a legally adequate justification for a repeal.<sup>[24]</sup>

However, by advancing directly to substantive policy questions, such comments skip a critical step in the rulemaking analysis. As an agency, NHTSA’s exercise of rulemaking authority is bound by specific statutory and legal frameworks that govern not only the substantive scope of available policies, but also the manner in which such policies may be articulated.<sup>[25]</sup> Therefore, NHTSA may not proceed directly to the policy questions surrounding EPCA preemption without first carefully considering whether the manner in which its views are expressed is appropriate and permissible. In this respect, both the Proposal and final rule are based on issues that arise prior to reaching any substantive conclusions about EPCA preemption. Namely, this reconsideration principally evaluates the legal authority for NHTSA to issue legislative rules implementing Section 32919 and the overly broad form in which NHTSA promulgated those regulations. As such, this action addresses these threshold questions while establishing space for the Agency to more thoroughly consider whether, when, and how to express its views on the subsequent substantive matters, such as whether particular state and local programs are preempted. In fact, the Proposal expressly acknowledged that NHTSA continues to deliberate further about “the scope of preemption under EPCA” and in the future may “announc[e] new interpretative views regarding Section 32919.”<sup>[26]</sup> But before doing so, NHTSA must ensure that the manner in which the issues are raised—including the manner in which the Agency has spoken about them in the past—conforms to the authority delegated to the Agency by Congress and is otherwise appropriate, as discussed in Part II.B. That is the focus of this rulemaking and a principal impetus for today’s repeal of the SAFE I Rule.

As described throughout this Final Rule, NHTSA has concluded that the SAFE I Rule exceeded the Agency’s authority by attempting to dictate the scope of EPCA preemption through regulations. Upon such a determination, the most responsible and legally essential course of action is for the Agency to exercise its reconsideration authority to rectify the overstep. The importance of the policy interests underlying the EPCA preemption issue do not compel a different approach. Instead, they only underscore the need for NHTSA to ensure that when it attempts to speak to these notable policy issues, it only does so as properly authorized and through an appropriate scope.

Moreover, now that NHTSA has determined that the SAFE I Rule exceeded the Agency’s authority for the reasons expressed in Part II.B.i. below and also impermissibly ignored important federalism interests without regard for the availability of a more circumscribed approach instead, as explained in Part II.B.ii.

below, it would be problematic to delay a repeal of the □ Rule until new interpretative positions on EPCA preemption (following the appropriate process) can be formulated. Many commenters, and particularly local jurisdictions directly affected by the SAFE I Rule's preemption determination, urged a swift finalization of this rulemaking in order to resolve their federalism interests.<sup>[27]</sup> Although the Agency agrees with these commenters about the need to repeal the SAFE I Rule swiftly, NHTSA stresses that today's action is not intended to determine that any particular State or local law is or is not preempted. As evidenced by other comments' diversity and depth of views on the substance of EPCA preemption, applying Section 32919 to particular state programs or types of regulations requires a more careful and comprehensive analysis, that is attentive to the legal and factual issues presented by a particular action. As explained further in Section II.B.ii., these intricacies are best addressed through careful deliberation and attention to the factual context relevant to the respective preemption considerations. Accordingly, requiring new substantive views on EPCA preemption to accompany any repeal of the SAFE I Rule would require the Agency to either delay a repeal of the SAFE I Rule even though the Agency considers it an invalid rule or, conversely, formulate a new overly broad substantive view on EPCA preemption that risks similar overgeneralizations as exhibited in the SAFE I Rule. However, this false dichotomy is avoidable by first focusing on a repeal of the SAFE I Rule before subsequently—and separately—taking the time needed to fully consider how to best approach any nuanced substantive issues that remain, if the Agency determines that such action is necessary.

Finally, it is worth emphasizing that EPCA does not state that NHTSA *must* speak substantively on EPCA preemption. This clear reading of Section 32919 was affirmed by commenters both supportive of and opposed to the Proposal. For instance, a supportive comment submitted by the State of California, together with numerous other states and local jurisdictions, emphasized that “even if EPCA did give NHTSA that authority [for the SAFE I Rule], the statute does not compel NHTSA to issue such rules.”<sup>[28]</sup> Similarly, a comment from the National Automobile Dealers Association (NADA), who opposed the Proposal, echoed the sentiment that the SAFE I Rule was “not specifically required by EPCA to be issued” as it was “not a necessary predicate to EPCA preemption.”<sup>[29]</sup>

Such comments recognize, as they must, that EPCA is totally silent as to any role for NHTSA in further defining EPCA preemption. They simply disagree on what that silence means. But even construing this silence permissively, as commenters such as NADA urged,<sup>[30]</sup> whether to speak substantively about EPCA preemption is, at most, a matter of Agency discretion. In this respect, EPCA contrasts sharply with other enactments in which Congress expressly instructed NHTSA or DOT to promulgate implementing regulations about a particular subject. Examples of such enactments abound even within EPCA, such as the unambiguous instruction in Section 32902 that “the Secretary of Transportation *shall prescribe by regulation* average fuel economy standards for automobiles manufactured by a manufacturer in that model year.”<sup>[31]</sup> In comparison to such statutorily mandated regulations, the silence of Section 32919 cannot reasonably be read as a requirement that NHTSA promulgate any particular preemption regulations or even opine on the substance of preemption at all. Under the framework advanced by these commenters, an agency could never return to silence after speaking substantively on a topic, even if it had good reasons to do so and the statute did not require the agency to speak on the issue. This unsustainable standard would permanently erode any NHTSA discretion to remain silent under Section 32919.

Therefore, regardless of the authority question, EPCA at most only afforded NHTSA discretion to decide how or even whether to speak on matters of preemption. Thus, even if Section 32919 is construed as commenters such as NADA urge, EPCA still must be read to permit NHTSA to remain silent on EPCA preemption. This includes neither codifying regulations on preemption nor making broadly applicable statements on EPCA preemption where the Agency has valid reason not to do so. And here, as discussed in Section II.B., NHTSA

has identified multiple clear grounds to repeal the SAFE I Rule. Such silence remains a viable option because, as commenters across the board recognized, the self-executing language of Section 32919 is fully capable of controlling the preemption question without the presence of Agency regulations.<sup>[32]</sup>

### III. THE NARROW SCOPE OF THIS RECONSIDERATION RENDERS SUBSTANTIVE POLICY ISSUES RAISED IN THE COMMENTS OUTSIDE OF THE SCOPE OF THIS RULEMAKING
