Geographic Variation in Non-HCC MELD Exceptions and Its Effect on Liver Transplant Waitlist Outcomes

The goals of this project are to examine the effect of non-hepatocellular carcinoma (HCC) Model for End-Stage Liver Disease (MELD) exceptions on liver transplant waitlist mortality at a county level using geospatial analytic techniques, to determine appropriate MELD exception score which mitigate disparities in waitlist mortality between exception and non-exception patients in each area using geospatial techniques, and to simulate waitlist outcomes under an alternative scenario where non-HCC MELD exception points are associated according geographic location.
