

The PERMIT-MN Act will restore much needed predictability, and frankly commonsense, to the permitting process and help unlock key materials essential to the electrification of the automobility industry and in turn help meet crucial goals associated with combating the climate crisis. To wit, the significant financial incentives contained in the Inflation Reduction Act passed last year, which will help bolster the affordability of EVs, require the establishment of a secure and conscientious materials supply chain. This act is an important step in that effort. Therefore, MICHauto supports the passage of this important legislation and applauds Congressman Stauber as well as that of his colleagues from both sides of the isle for their leadership to pass permitting reform legislation and establish a sustainable and secure domestic materials supply chain.

Sincerely,

Glenn Stevens, Jr.  
Executive Director, MICHauto
